Worth the Candle

by Alexander Wales (cthulhurajepsen)

Summary

A teenager struggling after the death of his best friend finds himself in a fantasy world - one which seems to be an amalgamation of every Dungeons and Dragons campaign they ever played together. Now he's stuck trying to find the answers to why he's there and what this world is trying to say. The most terrifying answer might be that this world is an expression of the person he was back on Earth.

Note: Up there at the top, it says "Creator Chose Not To Use Archive Warnings". This is very distinct from "No Archive Warnings Apply". The warning that there are no warnings is your only warning; do with it what you will.

Update schedule is, as always, whenever I feel like it (though there is a spreadsheet tracking word count). Most discussion for this work takes place on /r/rational whenever a new chapter is posted.

This story is now cross-posted on Royal Road.
I strained against the collar that held my neck in place, trying to get a better look around. My hands and feet were both cuffed, with thick metal bars connecting the cuffs to each other, resulting in no give at all. I had a gag in my mouth as well, but that was a little bit looser.

Five seconds ago, I had been passing notes in fifth period English.

I could see other people bound just like I was in the dim red light that came from regularly spaced bulbs. We were in two lines that faced each other. There was a loud droning sound that I imagined would be hard to talk over, if I hadn't had the gag. That sound, along with the vibrations in my seat and the curved walls, told me that we were in a plane, though I had no idea where we were going, or where we were.

I didn't see anyone that I knew. I had been in English class, so given that I was abruptly transferred into bonds aboard some barebones airplane, it stood to reason that perhaps others from my class had been too. The other boys and girls were around my age, but they didn't look like they went to school in Bumblefuck, Kansas. Part of it was the hairstyles, which over-represented mohawks and bright colors. But more than that it was the hard looks on most of their faces, a defiance that I associated more with terrorists on television than high-schoolers.

A man in army fatigues walked down the middle aisle of the plane, between the two lines of knees. He stopped just in front of me, which allowed me a good look at him. He was cleanly shaved and grey at the temples, with a scar that ran from the bottom of his chin up to his nose. His eyes were filled with an intense, burning hatred as he looked at us, which was accentuated by the way he grit his teeth.

"Rebels. Traitors. Murderers. Dissidents. Thieves. You are the scum that has floated up to the surface. A less civilized society would have put you to the sword the moment you were caught. We believe in our ideals. Strength through adversity, righteousness through struggle. If you survive, you will be stronger for it. Make it to the outpost, and a place in the Host is waiting for you, your crimes forgiven."

With that he walked away. I had questions, but I couldn't raise my hand and my attempt at yelling just came out as a gurgle around the gag in my mouth. None of what he'd said sounded comforting. I'd already been flush with bewilderment, but now fear had finally added itself to the mix.

The boy across from me was shaking his head from side to side. He'd been doing it for a while, but he'd started speeding up. With a quick jerk he hooked part of his gag on a bit of metal surrounding his neck and pulled it off completely. He showed no satisfaction at that, instead opting to start speaking.

"We're allowed to cooperate," he shouted. "We stand a better chance of survival if it's us against them instead of everyone for themselves. We can --"

He was drowned out by the airplane opening up its belly. A mile below us were farmlands in the half-light of an overcast day. I struggled against my restraints and prayed that I would wake up, even though I knew in my heart that this wasn't a dream. My feet were dangling into the open sky now.
Some loud mechanism was making a clank. I still couldn't move my head much, but in my periphery I could see people dropping down into the sky below us. As the sequence got closer to me, I saw that none of them were wearing anything resembling a parachute. What the army guy had said was ringing in my ear: strength through adversity. That seemed like the kind of thing you might say right before you murder someone.

Then the mechanisms released me and I fell, free of restraints.

The wind rushed past me. My stomach lurched at the feeling of weightlessness. I spread myself out, almost instinctively, trying to brace myself against the wind. I had let out a scream when I'd first started falling, but stopped when the wind started trying to force its way up my open mouth. I was going to die, just like all the others, and there was nothing that I could do to stop it. From this height, even an impact against water was sure to be as hard as against concrete.

I looked to the others that were falling, hoping that one of them had a solution.

Instead, I saw a murder. A boy with a pink mohawk had swooped down to collide with a girl. He struggled against her, holding onto her with one hand and a leg wrapped around her, and with the other hand pushing her chin up. When he applied sudden force, her neck snapped, and he detached himself from her as her lifeless body twisted and tumbled toward the ground.

To my horror, I realized that he was coming my way. I had no idea how to maneuver while skydiving, short of "spread out to slow down, put your hands to your sides to go fast". Given how fast the mohawked murderer was coming toward me, I elected to go fast and pinned my arms to my side. It took a few seconds to stop myself from spinning, but I certainly was going faster.

That meant that the ground was coming up towards me at a frankly alarming rate. I must have hit terminal velocity fairly quickly, but the perception of speed was greater the closer the ground got. I tried to think about why that was, and got as far as wondering whether it had to do with the viewing angle before deciding that I didn't really want to spend the last moments of my life trying to recreate physics knowledge from base principles.

When I looked back behind me, the pink-haired guy was gone. I could only see a few of the others in the air, as well as a few tumbling bodies that I assumed must be corpses.

The ground had gotten really close, close enough that I could start to make things out beyond just the irregular grid of farmland and a smattering of houses. To my left was a vast cloud so close to the ground that it must have been fog, but in the general area where my body was going to splatter was what looked like a gas station. There were no cars around, but there were people; they were looking up toward me with glowing red eyes. I might have found that ominous if it weren't for the whole imminent death thing. I closed my eyes as my heart hammered away in my chest. As deaths went, at least it would be fast.

I kept my eyes screwed shut, right up until the point where I realized the wind was dying down. When I looked around, I saw that death wasn't quite so imminent as I had thought; I was slowing down. There was a glowing rune on my right hand which I would have sworn wasn't there five seconds ago. By the time I finally got to grips with the fact that perhaps I hadn't been thrown out of the plane to my death, I was sliding down from the sky at a rather sedate pace. I was going to land maybe a hundred yards from the gas station in a big field. Four of the red-eyed people were nearby, but they were moving toward a girl who had already touched down. I could see now that these people had pallid skin and torn clothes, which, along with their shuffling gait, screamed ‘zombies’ in ten foot high neon letters.

As soon as my feet touched the ground, I heard a pleasant chime and words popped up in front of
Achievement Unlocked: Down, But Not Out …

I blinked twice and the message vanished. I had no idea what the hell that was about, but I had bigger things to worry about, like the zombie shuffling toward me. I had on black jeans, white sneakers, a leather belt, and a dull gray T-shirt. There was nothing I could use to fight it with, but I wasn’t about to try, given how slowly the zombie was shuffling toward me. (I also briefly wondered who the hell had dressed me, since black jeans weren’t my thing and I never wore a belt.)

I heard a scream of “Get the fuck off me!” from over to my left. I turned to look at the girl I’d seen from above, careful to keep the zombie near me within my eyeline. The girl had somehow gotten surrounded. Her eyes caught mine and she yelled to me, “Help me!” There was something indignant about the way she said it, like she was offended that I wasn’t doing anything.

I hesitated, and when I did, one of the zombies lunged toward her, moving surprisingly fast. She pulled away from it, but I could see that her shoulder was bleeding.

I started running. Not toward her, but away, steering clear of the zombie that was next to me. I had no weapon to speak of and I had only managed an orange belt in middle school karate, which is what they hand out to basically anyone who sticks with it a few weeks. I could hear the girl screaming, and I wasn’t sure whether it was at me or the zombies around her. Then her scream was cut off.

More words appeared in front of me. I looked at them more closely this time, though I didn’t stop running. The words moved with my eyes, like a heads-up display. They were just out of the center of my vision, but stayed in focus no matter what I was doing with my eyes. The words didn’t make me feel too good.

New Affliction: Cowardice!

I made my way toward the gas station, running at a jog and trying to conserve my energy. There were no zombies near it, and no people either. It would have been hard for me to forget that I’d seen someone get murdered in the air. I had blinked away the message calling me a coward, but I could feel my cheeks flushing with anger the more I thought about it. I had seen someone fucking die and I was supposed to just throw myself into a melee to help someone I didn’t even know? That wasn’t cowardice, that was just common sense.

Just before I got to the gas station, another message popped up.

Skill unlocked: Athletics!

I didn’t know what that meant either, not in this context, so I double-blinked it away and looked at the gas station, or at least at what I had thought was a gas station. Up close, it was clear that I was wrong. It had some of the hallmarks of Midwest gas stations, like the cheap cinder block construction and the unadorned metal doors. Where there should have been gas pumps, there were instead black shards of obsidian jutting up from the pavement. If they hadn’t been surrounded by cheap concrete curbs, or so evenly spread apart with metal trash bins between them, I might have thought that they had sprung up from the ground.

There were other incongruous notes, like the stack of clear barrels sitting out front, or the signs that showed advertisements for fresh frongal legs. That word, ‘frongal’ tickled at my mind, but I couldn’t make sense of it.
The road running by the building looked like normal asphalt, with a double yellow line down the middle. There were power lines running alongside the road and cars sitting in the parking lot, though there was something off about the shape of the cars, not just their 1950s style but something having to do with the way the hoods swelled up.

All of it was in a total state of disrepair; the grass I’d been moving through was two feet high and there were weeds surrounding the building where they’d managed to grow up between the cracks in the sidewalk. The building itself was covered in grime and two of the windows were busted out, with shards of glass visible on the ground.

I stood where I was, trying to work things out.

“Toto, I’ve got a feeling we’re not in Kansas anymore;” I muttered to myself. That had always been my dad’s thing; he said it whenever we went on a trip and crossed state lines.

My plan had been to get to the gas station and … well, I didn’t know what. Gas stations had people, food, phones, and transportation. If this thing wasn’t a gas station, I had some hope that wherever I was it was a proxy of one, but that didn’t help the fact that it was completely rundown and deserted. My gut was telling me that if I went inside I would find spoiled food or ransacked shelves, with no power to speak of and a phone that was non-functional. My gut also told me that if I went in there, I’d be easily cornered by anyone - or anything - that came after me.

My heartbeat was starting to slow down. The zombies that I had left behind were still shuffling towards me, and there were others out there, further away, which were visible mostly by the red pinpricks of their eyes. I looked at the building that was not-quite-a-gas-station and tried to steel myself. If nothing else, maybe there would be a weapon inside, or something I could use as one. I jogged forward and peered in through the busted out window.

The bad news was that it was almost exactly as I had feared. The shelves were almost entirely bare of supplies and the foul smell coming from the place seemed to say, “Hey, all this food is rotten and gross”. I still held out a little bit of hope that I would be able to find something in a can that hadn’t gone bad, assuming that wherever I was actually had things in cans. This whole world I seemed to have (literally) landed in was just one step to the left of reality as I knew it. About 90% of it could have been straight out of Bumblefuck, Kansas, if everyone had just gotten up and left for a few years, but that last 10%, like the red-eyed zombies and black crystal shards … well, they kept sending a chill up my spine.

When I slipped into the gas station, I saw a guy’s feet sticking out from behind one of the shelves. I almost yelped in surprise, but managed to hold it back. Now, my big fear was that this guy was going to rise as a zombie, or that I would round the corner to find something chowing down on his body, both of which I considered a real possibility. Another part of me thought that this was my best chance to get either a weapon or some answers. I had already checked my own pockets and found them empty. I picked up an empty rack for greeting cards, raised it over my head like a bat, and stalked forward.

Skill unlocked: Improvised Weapons!

The sound that accompanied the appearance of the text did make me yelp in surprise. I’ll admit that I was a little keyed up. Just after that though, I saw the foot twitch.

I’d always been far at the ‘fight’ end of the ‘flight or fight’ spectrum. I don’t say that because I want to sound tough, more to excuse the fact that my dumb ass ran right around the corner and started beating the life out of the corpse on the floor, which all things considered was probably not what I would call smart. I hit him twice on the head before the rack partly broke, then two more times until
it fell apart completely.

**Skill increased: Improvised Weapons lvl 1!**

The corpse was still moving, slowly crawling to its feet. I glimpsed a handle beneath its torso and grabbed for it; to my surprised pleasure I found I was holding what looked to be a rusted machete.

**Skill unlocked: One-handed Weapons!**

I blinked away the message as I brought the machete down on the zombie, just as it twisted its head around to look at me with glowing red eyes and a slack expression. The machete hit him right in the forehead, with my weight entirely behind it. I heard a crack of the skull splitting --

**Critical hit!**

**Skill increased: One-handed Weapons lvl 1!**

-- and the machete wedged itself halfway down his face, embedded between his glowing red eyes.

If there had been any justice in the world, that would have been when he stopped moving. His red eyes would have faded like at the end of Terminator, and he would have slumped back down onto the floor. Instead, he lurched toward me, opening his mouth. The only thing that saved me from getting bit (since my reflexes were essentially non-functional) was the fact that I was still holding the machete and it was still halfway through his head. That was enough to keep him at bay.

When I brought up a foot to kick him backward, a message came up telling me something about unarmed combat, and I put my full weight behind my foot to push him backward while keeping a firm grip on the machete. The machete came out of his head with a wet sucking sound and copious amounts of dark red blood, while the zombie tumbled backward and fell into a pile of garbage. He was back on his feet surprisingly fast though, and stared at me with his glowing red eyes, not seeming to mind the empty air between them.

That was how you killed zombies, wasn’t it? All the comics and movies I’d seen had been clear on that score, destroying the head was the only way to be sure, because they could keep coming if you did anything else. If that wasn’t how this guy was going to die though, what was I supposed to do?

I backed away from him as he shuffled forward. A quick glance out the window showed that more zombies were near me than before, though not so close that I couldn’t make a run for it. I looked back at Split-Face and tightened my grip on my machete. I wasn’t dumb enough to think that I could take all these zombies on without making a mistake, but if it came to it I needed to know what it took to kill one. My heart was beating like crazy in my chest, but I steeled myself.

The crazy messages that kept popping up were like something out of a videogame, that much I had noticed. Maybe that was why I’d been so certain that an axe to the head was going to kill Mr. Split-Face. But that didn’t work. So if I were playing a game, and literally cleaving someone’s head in half didn’t kill him, what would I do? Well, that was a sign that the designer was trying to be a clever little shit by subverting the expectations of the player. Come to think of it, I had done that in a D&D session once, a first level dungeon crawl.

Split-Face was still coming toward me and I was thinking about D&D for some stupid reason. What had I done, when I’d made the zombies’ heads irrelevant? I’d moved their weak point to their heart, that was it. And I’d given them glowing red eyes, just to have some descriptive flair.

Holy shit.
I aimed my machete at Split-Face’s heart, and I was just in time because he lunged at me a split second later, spearing himself straight through the chest. He stopped moving almost instantly and slumped to the floor with my machete still piercing him. That was when his red eyes finally faded to a milky white.

*Skill increased: One-handed Weapons lvl 2!*

*Zombie defeated!*

*Achievement Unlocked: Rambo*

*Level up!*

That last message came with a sensation that I can only describe as orgasmic. Golden light burst forward from me in a wave that kicked up wind and I briefly lifted up off my feet. It was like someone had jabbed a live wire directly into the pleasure center of my brain.

It was over in less than a second and left me trembling afterward.

“Did I just level up?” I asked the empty air. None of what had happened since I had found myself on that plane had much sense, but what I was seeing the outlines of was so weird that it almost started to make a bit of sense.

First, I was in a game, or at least something that resembled a game.

Second, that game had elements that I personally had created. It wasn’t just the red-eyed zombie variants that you had to stab through the heart, I was pretty sure that I remembered those black crystals out front. I’d called them the blackthornes, and they were used to power an ancient necropolis. Frongals I remembered too, they were giant frogs that people raised and slaughtered like pigs.

Naturally that just raised further questions. I closed my eyes for a moment and sighed, and that was when I saw my character sheet.

```
PHY
2 POW 1 Unarmed Combat 2 One-handed Weapons 0 Two-handed Weapons 1 Improvised Weapons
2 SPD 0 Thrown Weapons 0 Dual Wield 0 Pistols 0 Bows
3 2 END 0 Rifles 0 Shotguns 0 Parry 0 Athletics
MEN
2 CUN 0 Dodge 0 Engineering 0 Alchemy 0 Smithing
2 KNO 0 Woodworking 0 Horticulture 0 Livestock 0 Music
3 2 WIS 0 Art 0 Blood Magic 0 Bone Magic 0 Gem Magic
SOC
2 CHA 0 Gold Magic 0 Water Magic 0 Steel Magic 0 Velocity Magic
2 INS 0 Revision Magic 0 Skin Magic 0 Essentialism 0 Library Magic
3 2 POI 0 Wards 0 Language 0 Flattery 0 Comedy
0 LUK 0 Romance 0 Intimidation 0 Deception 0 Spirit
```

At that moment, 0 Luck sounded about right.
The thirteen ability scores all have hovertext that defines them, available whenever the character sheet is shown. If you are viewing this story in a format that strips the hovertext, here they are for reference:

**PHY**: Physical - Your body and physical existence in the world. Governing stat for all physical skills and the three physical abilities.

**POW**: Power - How much force you can exert. Used to break down doors, bend rebar, or shove someone out of the way.

**SPD**: Speed - How fast you move. Used to juggle knives, race over rooftops, or do cartwheels.

**END**: Endurance - How much you can physically withstand. Used to prevent poisonings, go on forced marches, or tread water.

**MEN**: Mental - Your mind and mental existence in the world. Governing stat for all mental skills and all three mental abilities.

**CUN**: Cunning - How smart you are. Used to figure out puzzles, learn new things, or decide which wire to cut.

**KNO**: Knowledge - How much you know. Used to make connections between disparate concepts, dredge up old memories, or memorize a ten digit number.

**WIS**: Wisdom - How much you can mentally withstand. Used to prevent stress reactions, make decisions without emotion, or meditate.

**SOC**: Social - Your personality and connection to others. Governing stat for all social skills and the three social abilities.

**CHA**: Charm - How much people like you. Used to convince princesses, barter with barmaids, or plead for your life.

**INS**: Insight - How well you can read people. Used to uncover a princeling's secret, call a bishop's bluff, or avoid being stabbed in the back.

**POI**: Poise - How well you withstand other people. Used to withstand interrogation, keep a blank face during a hearing, or keep dry eyes during a wedding.

**LUK**: Luck - How lucky you are. Influences everything, governs nothing.
The character sheet appeared whenever I closed my eyes for three seconds. That’s not me being casual with my language, I sat there and timed it after the first time it came up. It was like the messages I’d been seeing that flashed up into my field of view to inform me of achievements, skill unlocks, and things of that nature. No matter where I turned while my eyes were closed, the whole character sheet stayed in focus. If I moved my eyes to the sides, it switched to mostly blank ‘pages’ with nothing more than empty panes and the occasional title like “Virtues”, “Companions”, “Spells Known”, and things of that nature. I did eventually find one that said “Afflictions” which had “Cowardice” listed, but it didn’t seem like that actually did anything, or at least it didn’t have a tooltip. Somewhat surprisingly, there was no inventory, though there was a pretty pointless page that gave me a physical description of myself. The only information of note there was that I was level 2, which I’d already guessed.

(I won’t belabor my physical description. My friend Greg had once said that I looked like someone had chosen ‘default’ for every option in the character creator, which I’d tried to laugh at but cut kind of deep. I wasn’t handsome, I wasn’t ugly, none of my features were very prominent, my eyes were blue, my hair was brown, average build, average height … After Greg had made his comment at one of our D&D games, my nickname had been ‘default’ for a while, at least until I stopped pretending to find it funny, and even after that my friends would use similar lines to trash talk me, saying that I was “the most generic man alive”, “a white bread with skim milk motherfucker”, or “the human equivalent of vanilla ice cream”. Not that I was any less of an asshole to them.)

I opened my eyes and looked around the gas station, then to the zombies out front. I judged that they were far enough away that I didn’t need to worry about them quite yet and closed my eyes, even though a part of me (probably my WIS) was saying that it was a really bad idea to just stand there not looking out. I did it anyway; I wanted some answers.

The problem, so far as I could see it, was that this wasn’t a system that I was familiar with. You might think that’s hubris talking, as though I thought I’d have been just fine if the character sheet had been for 5th edition D&D, but at least it would have been a start. 5th is harder to munchkin than Pathfinder, but at least I have a handle on the ins and outs of it. That would have been a huge advantage. I’d thought that on first glance, and thought it even more when I discovered that looking at the abbreviations for long enough brought up tooltips. (Tooltips inside my head!)

There were abilities and skills, which were familiar enough, though if there were thirteen abilities in total that seemed like a bit much. There were four rows of ten, for forty skills in total. They apparently needed to be unlocked before they could rank up. Thirty-six skills were still greyed out, their names just on the other side of readable no matter how hard I squinted at them. If this game was like other games, then I could guess at what some of the missing skills would be …

But there were risks there. I opened my eyes and looked out at the zombies, with their glowing red eyes. The zombies were an idea I’d had, one that I’d presented to my friends in a D&D session, and here they were come to life. I’d put myself at risk thinking that ol’ Mr. Split-Face (he of the slick puddle of viscera on the floor) was going to be like any old zombie I’d seen in TV or movies. If I had been a game designer (and I did consider myself one, in a way, since I did most of our DMing) then I would have made a zombie like that, placed right at the game’s start, as a way of giving a warning. “You cannot depend on your knowledge of other games,” Mr. Split-Face seemed to say.

I picked the machete up out of the zombie’s body, dislodging it from his heart. The smell hit me in a wave and made me want to puke, but I just barely managed to force a lump of something back down.
my throat. I went back to the front area of the store, stepping warily and trying not to make a sound. A quick look at the coolers in back showed them in a total state of decay. I didn’t think I would find anything of value in them, nor did I think that my stomach could survive the assault of that stench. Mostly, I wanted to get out of here, except that the fields outside and the long empty road were not exactly as much “out of here” as I might have liked. I tried to remember what the military guy on the plane had said, but came up blank.

I closed my eyes again and looked at what I was starting to think of as my eyelid menu. There was a small, glowing ‘+2’ in the upper right, just outside the character sheet proper. When I looked at it for a second, the character sheet rippled and changed, expanding slightly to allow for some plus and minus signs to surround all the ability numbers. That part was somewhat comfortable to me; I had increased in level, so I had some points to distribute.

I had no idea where to start though. If Rule 1 was “don’t depend on game design to exactly match other games” then Rule 2 was “don’t depend on game design to be good”. I had played enough poorly thought-out games to know that sometimes there were broken abilities and dump stats, but just knowing that systems were sometimes flawed wasn’t enough to know where those flaws were. All I could do was stare at the character sheet and make some guesses.

A third of the abilities were social; those I dismissed out of hand, since the zombies were my main concern at the moment. A third were mental; those I reluctantly decided against, since they were usually good for doing magic, which I hadn’t unlocked, and if the “linear fighters, quadratic wizards” rule applied then I was liable to get my ass handed to me before I could become powerful. That left everything under PHY. Curiously, I could increase either PHY or the three abilities it was tied to, POW, SPD, and END. The tooltips gave me no indication of what the underlying mathematical reality was.

When I tried to put a point in PHY, I saw them both vanish, moving it up by one, which cascaded to the other three abilities and increased those by one as well. Ah. That seemed like a pretty good deal to me; I was basically getting double the number of points, or maybe only half again if PHY didn’t actually do anything on its own. If the game design were sensible, then this was probably a generalist/specialist trade-off, but in order to meet the immediate (and largely unknown) problems I was facing, a generalist approach was probably right.

When I opened my eyes, the zombies had gotten worryingly close. I gripped my machete and stepped out of the gas station’s front door. The zombies were slow, slow enough that I could out-walk them, but the trick was that they would just keep walking, and trying to kill them wasn’t without its risks, especially if they could infect a person with a scratch or bite.

(If I was actually trapped in a game, then basic game design dictated that the game not kill players over something that they didn’t know and couldn’t find out. Of course, Rule 2 was that I couldn’t depend on good game design, and there were some genres or schools of thought where it would be acceptable, like in Call of Cthulhu where deadly wasting sickness was par for the course. Still, if it had been me, I would have had the source of the zombies be something like a dread necromancer putting all his effort into sustaining this undead militia, or some intriguing bit of technobabble like a necrotic field effect.)

There were about thirty of them in all. The closest was twenty feet away. I walked up slowly, cautiously with my machete held in front of me. I remembered reading that stabbing things in the heart was surprisingly difficult, because you had to have your blade dodge both the sternum and the ribs. Worse, machetes were made for getting a lot of power behind a swing. Trying to pierce something with one was like trying to make a hole with a meat cleaver. The basic purpose of a machete was cutting down jungle undergrowth or sugar cane, not poking holes in hearts.
I didn’t mention it before, but can I say how utter bullshit it is that I only had a 2 in KNO? I wasn’t terribly athletic, I wasn’t great in social situations, and I wouldn’t have even called myself that smart, but dammit, I had drunk knowledge from Wikipedia like I was dying of thirst and I’d read a mountain of books.)

I lined up my strike and swung for the zombie’s neck. She lurched forward right as I did make my attack, and I ended up hitting her in the shoulder instead. I had to push her away from me in order to prevent her from getting her hands on me, and when I did my fingers touched surprisingly warm flesh. It was like pressing my hand against a feverish forehead. I hacked at the zombie again, this time striking her in the collar bone. The crack of bone made me wince, but I reared back for another swing. My arm briefly blocked my view for just long enough that the zombie had time to move. I ducked out of the way of her hand, then backed up to give myself some room.

**Skill Unlocked: Dodge!**

Well, I couldn’t say that one was too much of a surprise. I swung at the zombie again, hitting her in the temple this time, and one of her red eyes flickered out like a light. I wasn’t sure quite what that meant; when I had made my own version of these zombies, their eyes were nothing special and the glowing effect was purely cosmetic.

The other zombies were getting closer to us, so I attacked again, resolving to turn tail and run if this didn’t do anything. My machete came down from up high in a double-handed overhead swing with all my power behind it and hit right at the place where I had broken her collar bone. There were two distinct wet cracks as the machete cut its way through ribs and then the light in her other eye went out. I managed to hold onto my machete as she slumped to the ground.

**Skill increased: One-handed Weapons lvl 3!**

**Zombie defeated!**

I had hoped to kill a few more before leaving, mostly to level up, but they were clustered too closely together now, and I wanted to escape before things got dicey. I moved away from the center mass of the crowd and slipped through them without any problem, then got on the road and started walking at a brisk pace.

The thing was, I didn’t actually know whether the stats I could see written on my eyelids actually *did* anything. When I’d swung the machete I hadn’t felt any better at it at level two than level zero, and there was no clear relationship between that number and the outcome, at least not to me (with the heady rush of leveling up being the one exception). That meant that staying in one place and trying to kill relatively easily killed things was still too much of a gamble, at least until I learned more.

I’d had a choice when I’d gotten to the road, and I had decided to go toward the distant buildings rather than the flat, seemingly endless plains. It was overcast, so I couldn’t see the sun, and without that I had no idea which direction I was going. I had never really had much experience outdoors. Maybe if I had, I would have been able to find directions without the sun to guide me. There was something having to do with moss, I remembered, but I couldn’t recall what it was. It wasn’t really like directions would help anyway, not when I had no idea what kind of world this was.

I tried to keep a steady pace to my walking, fast enough that I would be able to get somewhere, but slow enough that I wouldn’t get tired. Oh, and the zombies were still following me, as I could see by the veritable field of red eyes behind me. They were slow, but if they kept on me I was going to have to find somewhere to hole up in order to sleep. They didn’t seem to be very strong, though I’d thought I’d seen a few bursts of speed and power from them, like when Split-Face had stood up in the gas station or when they did their lunges. A door might hold them back, but for long enough that
I would be able to sleep? I’d need an exit strategy on top of that. The military guy had said to get to the outpost, which seemed like a reasonable goal (and the start of a quest) but he hadn’t said what direction it was in or how far away. Either way, I didn’t think I would be able to get there before I needed sleep, so finding a safe place to hole up was imperative.

**Skill increased: Athletics lvl 1!**

Right then, brisk walking apparently counted as athleticism, which was good to know. I had been waiting for that one, and I *did* notice a change this time. My steps became a little more sure, a little more swift, and I straightened my posture slightly. I wondered how much of that, if any, was psychological. Either way, it gave me some more information about the game system, which was welcome.

I didn’t have too much time to ruminate on that though, because I had come close enough to the crop of buildings to get a look at them. It looked like the kind of tiny town that you could find all over the Midwest in general and Kansas in specific, a place that existed mostly because there was a limit to how far farmers were willing to drive for groceries, gas, and a haircut. Three giant grain elevators dominated the town, but again there was a note of the exotic, because each had a large antenna rising up from its side, marked with floating, rotating sigils that were barely visible by the unearthly blue light they cast.

It was with a start that I saw people moving across the main road. They were running, a short-haired blonde girl in the lead and two guys with pink mohawks chasing after her. Or at least, that’s what I thought at first, until I saw the thing following them. It was a blackened creature of corpses, with eyes as large as headlights and a body so big it would have a hard time hiding behind a gas station. It was moving far faster than the zombies had moved, slamming down its fists and dragging itself to make up for a back leg that was crooked and broken.

I was between a rock and a hard place, with the enormous necrotic monster ahead of me and the horde behind me. I didn’t think either was within my abilities, but at least if I moved on ahead there were buildings that I could hide in and maybe try to loot while the big guy was distracted.

**Affliction: Cowardice lvl 2! (WIS -1, POI -1)**

“How is that cowardice?” I asked, but I soon realized the answer. I’d gotten ‘Cowardice’ when I had run away from the girl getting attacked by four zombies, right when I’d landed. Here I had been presented with another girl running from both the scary guys with mohawks and a monster, and I hadn’t even spared a thought to running to her rescue. “That’s not cowardice, that’s selfishness, if anything,” I said to the air. There was no response, not that I had expected one.

I began jogging toward the town. The nearest building looked like some kind of mechanics shop; there was a large folding door by the road and while the vehicles in the parking lot were rusted out, some of them also had doors off the hinges and open hoods in a way that suggested some of the disrepair predated whatever it was that had happened here. The biggest point in its favor was that it was the closest place to hide from the Big Ol’ Corpse-Legs, which had disappeared out of my sight.

There were no zombies in sight, and a quick peek through the small window in the side door showed nothing waiting for me. With rusty machete in hand, I opened it slowly and tried my best to emulate what the SWAT teams I’d seen on TV did, sweeping the room from side to side (a technique that probably makes more sense when you have a shotgun or rifle). The room that I’d come into was some kind of waiting area, the kind that in the Midwest had uncomfortable chairs, stale coffee, and a few out-of-date magazines, all of which mingled with the smell of car guts and wheel skins to create a very specific ambiance. Here it was almost the same, but the coffee pot was replaced by a tea kettle
sitting on top of a handful of rocks (though the little cups of creamer and packets of sugar were about what I was used to).

The smell was atrocious, probably because of the body. Sitting in one of those uncomfortable chairs was the corpse of one of the guys with pink mohawks. I would have been on guard, waiting for him to rise from the dead, but he had two very precisely placed dime-sized holes in him, one in the center of his forehead and the other right in the center of his chest. He was practically drenched in blood from the chest down.

I think it was only my experience hunting deer and cleaning the kills that got me through that without throwing up. It brought back the same queasy feeling I’d had one summer when I’d shot a buck in the gut and had to chase it all over the hills as it bled out, but I’d gotten through that, and I would get through this too.

I moved further into the building by the light of dirt-clouded windows, looking for anything useful, but mostly trying to make out whether the shapes I was seeing had limbs or heads, and whether the reflections of light that I saw were buttons or eyes. I kept my footsteps as quiet as possible, but it all sounded impossibly loud to me --

*Skill unlocked: Deception!*

The chime that came with the message caused me to tense up for a moment as my heart hammered in my chest. It had been some time since I had gotten one of those messages, enough that I had almost forgotten. I pushed the questions it raised out of my head. (Did this system use the same skill for both stealth and lying to people? What stat governed Deception, SPD or CHA? What condition had caused the unlock to trigger?) The next door, which based on my reading of the building would lead into the shop itself. I took a deep breath, slowly lowered the door handle, and pushed the door open with my foot just a crack to look inside.

Standing by a workbench, among various car parts, tools, and cans of unidentified fluids, was the most beautiful girl I had ever seen.

I’m not really sure what protocol is here, in terms of prose. I mean, I don’t want to sound like a creep, so maybe I should stay as generic as possible and tell you about her dark red hair pulled back in a braid, the glacial blue of her eyes, how starkly alert she looked as she peered over the parts in front of her, or her grease-smeared clothes. Save for her eyes, I wasn’t really focused on any of that. My mind was consumed by tracing her curves, the swell of her tits in her blood-stained t-shirt, the fullness of her lips and the delicate way she had them parted -- and yeah, it was pretty fucked up that the splatter of blood on her shirt wasn’t worth rating much of a mention. I was consumed with staring at her and thinking how gorgeous she was, until I noticed that she was having a powerful effect on me, at which point different parts of my mind were given over to marveling at the sensation of being so attracted to a girl, and others were still focused on her.

Imagine that someone spent a few years studying your likes and dislikes, running through video of your every private moment, somehow surreptitiously hooking up EKGs to measure your physiological responses without you knowing. Then imagine that they sat down with that data and the best photo manipulation artists in the world and made the absolute perfect picture to cause your heart rate to spike, a jolt to run up your spine, butterflies in your stomach, and a cold sweat on your palms. Then imagine that they did this again, over and over in slight variations, until they had a full 4K 60fps 3D movie to show you. That was what it was like watching her.

(And if that analogy sounds a little bit frightening to you, then I think it did its job, because there was a part of me that was afraid of how pretty she was, a part that was angry that someone could provoke such a reaction from me, and a small, mostly unexamined part that was instantly distrustful of
someone that could hijack my brain in the way she did.)

She was rooting around in the parts on the bench, occasionally turning one over. She picked up a particular one, a flat little rectangle with what appeared to be a handle. With a smooth motion she held it at arm’s length and swept it to the side until a small hole in the thing was pointed at me. That small hole was roughly the size of the ones in the dead guy out in the reception room, and even in the state I was in, I was able to peg the thing she was holding as a mostly flat, mostly vertical gun.

“Don’t move,” she said.

“Buh,” I said. I’d wanted to say ‘but’, to start some sentence, but it caught in my throat.

**Skill unlocked: Romance!**

(Har har game, har har.)

“Name,” she said.

Eventually some spinning gears in my mind slipped into a position to do some work, and I realized that she was asking me my name. “Joon,” I said.

“Jon?” she asked with a raised eyebrow.

“No, Joon,” I said. “Short for Juniper.”

She was staring at me with her teeth set. There was a tension to the way she held herself, like a bow ready to let an arrow loose.

“Background?” she asked.

“Uh,” I said slowly, trying to play for time. I had a sneaking suspicion that this was exactly the kind of thing that POI was used for, and mine was at a whopping one point thanks to the penalty I’d taken.

“Background,” she said with a curl of her lips.

“Student,” I said. I had no idea what she wanted from me; maybe saying that my dad flew helicopters and my mom worked in a box factory would have been more helpful.

She looked me up and down, or at least as much as she could given that I was still partially obscured by the door. “Which athenaeum?” she asked.

“I, uh, I don’t know what that is,” I said. It was true when I said it, but right after a memory sparked and I recalled the term; it was a fancy term for a place of literacy and learning, taken from the name of the Greek god Athena. I’d used it in a D&D campaign before, when the party had been tracking a goblin ranger through the halls of the abandoned Athenaeum of Quills and Blood.

“Why did they put you on the plane?” she asked. I could tell that my athenaeum answer hadn’t done me any favors. Her gun was still pointed at me, which only slightly dampened my attraction.

What had the guy on the plane said? **Dissidents.** “I was caught distributing pamphlets,” I said, hoping against hope that she wouldn’t press me on it.

**Skill increased: Deception lvl 1!**

I couldn’t tell whether she believed me or not, but she lowered her gun slightly so it was pointing at
my stomach instead of my chest. “Step out from behind the door,” she said. I did so, lifting my hands above my head and putting my machete on full display so she could see that I didn’t mean to be a threat. “Drop the machete,” she said. I did as she asked.

“The Fuchsia Coterie came down with us,” she said. “They have a mission in the Risen Lands, and part of that mission is putting down anyone who sees them. Ordinarily, one in one hundred survive the journey to the outpost, but the Color Riot will ensure that you don’t even have that hope … not unless we work together.”

Well, that was a pretty shockingly straightforward hook.

“I’m in,” I said. “What needs doing?”

**Quest Accepted: Seven Bells for Seven Hells!**
“That is an XC-class soulcycle,” said the most beautiful girl in the world. The thing she was pointing at sat off to the side of the auto shop floor. It looked more or less like a motorcycle, but it had metal wheels instead of rubber and where a gas tank would normally go there was a thick glass barrel which stood completely empty. “Comfort has been picked clean and I think that’s our best chance of getting workable transportation. I can’t do it without you.”

“Two questions,” I said. “First, you haven’t given me a name.”

“That’s not a question,” she replied. “But if you’re Juniper, you can call me Cypress.”

“Second, who or what is Comfort?” I asked.

“Comfort is this town’s name, and from what I saw while I was falling, it’s the only place of note for a dozen miles,” she replied with an arched eyebrow. “You missed the giant sign?”

“I guess I was distracted by all the zombies,” I replied.

**Skill unlocked: Comedy!**

But apparently the humor was lost on her, because she lifted her gun back up and pointed it right at my chest.

“What did you say?” she hissed.

I swallowed hard. “We, uh, don’t say the z-word?”

She slowly lowered her gun again as her pale blue eyes searched my face. “I didn’t believe you, when you said that you were a dissident. I know that things have gotten bad, especially for the poor, but … there are still traditions worth keeping. There are still rules worth following.” Her eyes left mine as her thoughts went elsewhere.

“Uh,” I said. “Okay. I really didn’t mean anything by it. I didn’t know that calling them z-um thing like that would be a big deal.”

“That’s the whole problem,” she spat. “It’s throwing the baby out with the bathwater, assuming that there aren’t reasons.”

“No, I mean, I’m not from around here,” I said. “I’m from Bumblefuck, Kansas. The first thing I saw of this world was the inside of the plane just before we dropped. I don’t know if I was magically transported here or what, but I’m not even from this world.”

**Achievement Unlocked: Full Disclosure**

Cypress looked me up and down again, which gave me more time to think about how pretty she was, not that I needed it. I was starting to get annoyed with myself, but that didn’t really stop me.

“I see,” she finally said. “You’ve been dream-skewered.”

“Uh … what?” I asked.

“It’s okay,” she said. “We can still make it out of this and I can get you the help that you need.” She spoke slowly, as if to a child.
“I’m not dream-skewered,” I replied. “I’m from a place called Earth.”

Cypress nodded. “I know it,” she said. “It has seven continents, two large oceans, and it’s a spinning globe with ice at the top or bottom. Right?”

I nodded, slowly.

“That’s the dream that skewers,” she said. She tucked a strand of hair behind her ear. “All thoughts and memories wiped away in an instant, replaced by the dream of Earth and a different life there. It’s a fate only slightly better than death.” She shook her head. “You can still help. We still need the soulcycle up and running so we can escape the Coterie. It’s just going to make things a little bit more difficult.”

I shook my head. “No, I’m sorry, I need to … “ I paused and tried to gather my thoughts. “I need more. How many dream-skewered are there? Do they all have delusions of being the one to have thought up this place? Do they all see the game overlay? Do they level up like me?”

She bit her lip. There was something new behind her pale blue eyes, a softer emotion. “There have been perhaps a thousand of the dream-skewered,” she said. “They are cared for and studied at the Athenaeum of Speculation and Scrutiny. To my knowledge, their only delusions are of their lives lived on Earth. You think that you created Aerb?”

Aerb. That was exactly the sort of laziness that I would have shown if a player had asked me the name of the world and I hadn’t had one available. “Parts of this world look similar to ideas that I had come up with back on Earth,” I said. I didn’t know the full scope yet, but there were about four or five points of similarity so far, and I had only seen a very small fraction of the world. Please, please don’t have Fel Seed.

Cypress frowned. It was a pretty frown. “How narcissistic,” she said. “Nothing against you, obviously, I’m just thinking about it in the context of the delusion. The interesting thing about the dream-skewered is that their records of Earth match up, even if they haven’t had communication with each other. But for you to work elements of this world into your delusion … if, when we get out of here, you’ll have to consult with the Athenaeum of Speculation and Scrutiny.”

**Quest Accepted: Straddling Worlds!**

I’d done nothing of the sort, but I was starting to realize that accuracy of language was not the game layer’s strong suit.

“What about the game overlay?” I asked. She gave me a questioning look. “There are words that appear over my field of view,” I said.

“I’ve never heard of such a thing,” she said. She looked toward the motorcycle - the soulcycle, I guess she’d called it. “Whatever is wrong with you … it has to wait. We’re safe here, I think, so long as the Coterie doesn’t attack en masse, but that’s only a matter of time. We need damned souls to fuel the soulcycle.” She walked over to the work bench. I noted that she still held her gun in one delicate hand. She picked up a small jar with thick glass walls, put a long spike in it, then handed it to me. Our fingers touched briefly.

“She said she’d called it. “Whatever is wrong with you … it has to wait. We’re safe here, I think, so long as the Coterie doesn’t attack en masse, but that’s only a matter of time. We need damned souls to fuel the soulcycle.” She walked over to the work bench. I noted that she still held her gun in one delicate hand. She picked up a small jar with thick glass walls, put a long spike in it, then handed it to me. Our fingers touched briefly.

“Have you ever used one of -- no, sorry, your memories are gone, of course you wouldn’t remember if you had. Stab the spike into the heart or head of a corpse, it’s spiraled to draw the soul out. If you see someone die, you have thirty minutes to collect before the soul leaves the body. If their heart is still intact, you have maybe three minutes until they rise as one of the undead, but the soul is still retrievable so long as they’re put down before the half hour is up.” She went back to the bench and
picked up a glass stopper. “Keep the jar sealed when there are souls within it, they’ll dissipate otherwise. We’ll need seven, I think, to get where we’re going.”

*Seven Bells for Seven Hells.* That was the first thing that really succeeded in affecting my impression of Cypress. She had killed the guy in the waiting room, I was almost certain of that, but that didn’t really bother me. She had pointed a gun at, variously, my face, throat, groin, stomach, and chest, but a defensive posture was something to be admired in a place like this. Destroying souls in order to fuel a motorcycle that would get us out of here … well, that was pretty metal, but it left a bad taste in my mouth.

“Wait, is there an afterlife?” I asked.

Cypress’ lips formed a thin line as she looked at me. “I was serious when I said that we don’t have much time, Joon.” The sound of my name leaving her lips sent a shiver down my spine.

“Alright,” I said. “You want me to go out and scavenge. I can do that.” I looked at her gun, which she was still holding loosely by her side. “I would probably fare better if I didn’t have to go into melee.”

To my surprise, Cypress handed me her pistol. My surprise must have been evident on my face, because she gestured to the worktable. “I’ll build another,” she said.

*Skill unlocked: Pistols!*

I looked down at the gun in my hand. The boxy part had roughly the proportions of a deck of playing cards, but slightly bigger and set on edge. A rubber grip with a trigger was attached to it; it wasn’t a normal trigger you’d pull with your finger, but instead the kind of thing you’d find on a spray bottle, where the trigger extended down the length of the handle and was squeezed with all the fingers of the hand. I looked at the hole in the boxy part, but couldn’t see inside. There was no obvious mechanism for feeding ammo into it.

I had a bunch of questions for Cypress, but I worried that she would think they were dumb. Questions like, how the fuck did you build a gun in the hour or so we’d been here? Or, what does this gun even shoot? Or, isn’t this gun going to be difficult to shoot given that you have to squeeze your entire hand? And, given that, how did you manage to shoot a guy in the center of his head with this thing? She knew that I knew nothing about this world though, and had offered me the gun anyway, without deeper explanations, so I figured asking would just get her even more exasperated with me and wasn’t likely to get answers.

“Seven souls,” I said. “I’ll be back when I have them.”

*Loyalty Increased: Amaryllis lvl 0!*

I went out the way I had come, back through the dark hallway and into the reception area. The corpse was still sitting there, smelling up the place. I took a moment to take stock of my situation.

**Theories as to What the Frick is Going On**

1. **Dream theory:** I’m either dreaming, in a coma, hallucinating, or having a mental break. This doesn’t feel like a dream, and I can’t really do anything about it if this theory is true, so … noted but discarded.

2. **Simulation theory:** I’m playing a game of some kind, with hyper-realistic visuals, full haptics, smells and tastes, in a world custom-made from elements of my own imagination. That
explains the things that have been coming on-screen, plus the near-orgasmic level up, plus how someone as hot as Cypress (Amaryllis?) could possibly exist. It does not, however, bridge the gap between fifth period English class and sitting on the plane … in what was in retrospect, obviously a cutscene. Plus all the tech needed to do an in-depth, personalized simulation like this would basically require the Singularity to have happened.

3. **Actuality theory:** This place exists, and I got here through hitherto unknown magic or technology, which slammed me into a body that was identical to my own (as confirmed by a check of the freckles on my arm). That didn’t explain the game overlay in the slightest.

4. **Dream-skewer theory:** I was actually a guy from Aerb who was suffering from delusions that he was from a place called Earth, complete with memories of my pet hamster Mildew, the phone number of a Chinese takeout place in Bumblefuck, Kansas called the Great Wall, the time my grandmother had chastised me for using the salad fork during dinner, hundreds of little tiny things like that, along with all the big ones. Cypress had said that happened before, so maybe, but it didn’t explain the game overlay either.

Of course, the truth could be a mixing and matching of some of those theories. Anyway, the real question wasn’t so much what I believed to be true, but how I would change what I was doing on the basis of the possibilities. I considered the chance of Aerb being a dream fairly high, but that wasn’t particularly actionable. None of it was, frankly. If it was a game, the rules were opaque, and whether I was from Earth or Aerb didn’t immediately matter except in the metaphysical sense. It had been awhile since I’d looked at Maslow’s hierarchy, but I was fairly certain that metaphysics was fairly high up it, above more basic things like “not getting killed by zombies”.

Part of taking stock meant closing my eyes and looking at my character sheet. It had filled out a little bit more as I had unlocked more skills, but I was a little bit worried about the negatives to WIS and POI, which left both of them at a single point each. The ‘Cowardice’ thing seemed progressive, which meant that if I got hit with it again, I risked falling to zero on both of them. In various editions of D&D, hitting zero in any stat was special; you didn’t just suck at that thing, you became paralyzed, fell into a coma, or died depending on which one it was. Now, I didn’t know whether that would be the case here, but given that death was on the line I couldn’t risk it, especially since something like paralysis or coma would effectively be death.

But I’d gotten the two levels of ‘Cowardice’ affliction for what I thought were self-motivated but completely rational decisions. I’d been scared when I’d seen that girl surrounded by zombies (and the memory of her bones cracking made me wince) but I didn’t think that was what had motivated me to run. The problem was, if I was going to get punished by the game layer for not running in to be a big damned hero, then maybe the calculus slid the other way. If you asked me, running into a fight you didn’t think you could win solely because you were worried you would be punished with death didn’t exactly scream courageous.

I was also somewhat chagrined that offering to help Cypress by charging into danger wasn’t considered heroic enough to lose at least a level of ‘Cowardice’, but I figured I’d have more of a right to gripe when I had actually done something, instead of just sitting in the waiting room with a corpse. Speaking of which …

I went up to the body. Pink mohawk aside, he was dressed down, with light brown pants made of some kind of canvas and a plain, unadorned t-shirt. I took the small glass jar from out of my pocket (which it sat awkwardly in, like carrying around a can of pop), pulled the spike out from it, and approached slowly. I wasn’t quite sure how long he had been dead, but the blood hadn’t coagulated yet, which made me hopeful. I also wasn’t sure on the procedure, but I stuck the spike in his chest hole, trying to keep my fingers from touching him while I pushed it in. The head of the spike was almost touching his blood-soaked shirt when it began glowing a soft, pale white. I watched it, not knowing what would happen. Within the space of half a second, a ball of light had formed, which
unceremoniously dropped down. I managed to catch it in the glass jar before it could land on the corpse’s bloody lap.

**Quest Progress: Seven Bells for Seven Hells, 1/7**

The instant feedback was welcome. I pulled the now-dormant nail out of the corpse, wiped it off on a part of his shirt that was relatively untouched, stuck the spike in the jar, sealed it up, and let out a breath I hadn’t realized I was holding. I had apparently just captured someone’s soul.

I went to the door, gun in hand and machete dangling from my side. The coast looked clear, but in a videogame this would have been a perfect place for a jump scare. I pushed the door open with my foot and went out into the oppressively gray sky overhead.

This, then, was the town of Comfort. I’d been paying more attention to the enormous monster than to the buildings, and after it was out of sight I was focused on the auto shop. Now that I was paying more attention, I saw something I’d missed: half the buildings were made of cobblestone, with thatched roofs. That fact hadn’t even registered with me. I wasn’t sure whether I had mistaken them for something else or simply not processed them, but it was another reminder that this wasn’t Kansas.

Now then, in a videogame, usually when some NPC gives the player what’s clearly a main story quest, the first thing any right-thinking player does is ignore it completely. Videogames basically trained gamers for it; no matter how many mouth noises the NPC made about the desperate urgency of the task, we knew that it wasn’t *really* urgent, not unless there was a countdown timer on the screen, and maybe not even then. It was considered poor game design to punish people for taking the time to see the sights and explore the world.

In tabletop RPGs, it sort of depended on what kind of DM you had. Myself, I wasn’t afraid to bring down the hammer hard if the players didn’t react to the word ‘urgent’ with actual urgency. To my way of thinking, if your words of warning meant nothing, then you’d shot suspension of disbelief in the foot. Of course, in a tabletop game it was usually easy enough to route to a different plot point if the village burned down, and I understood that game designers didn’t exactly have the luxury of rewriting the plot around every failure, but that was part of what I felt made tabletop games so much better.

So yes, there was a part of me that was screaming that the appropriate reaction to being in a game was to run back to the area with zombies and level grind until I was a badass so I could steamroll through the town of Comfort. But if this place was on some level influenced or inspired by my thoughts and ideas, then didn’t it become more likely that the game layer would agree with my opinions?

I was stuck by the door awhile, thinking about this instead of moving, paralyzed not by a precipitous drop in WIS, but by my own indecision and over-thinking. Who knows, maybe I might have sat there forever if two guys with pink hair hadn’t crept around the corner.

They started moving almost as soon as I spotted them, both keeping low to the ground and behind whatever cover they could find. I aimed my pistol at them, holding it with both hands. I wished that I had spent some time in the auto shop practicing instead of thinking myself dizzy or fawning over Cypress. One had a length of pipe, while the other, for whatever reason, was carrying a sword. I took aim at the one with the pipe as he scurried between cars -- my first time ever aiming a real gun at another person -- and squeezed the trigger.

The pistol made a little *thwip* sound, but there was no flash of light like I had expected and the recoil was like being pushed with a feather. At first I thought something had gone wrong with it, but the guy I had aimed at stumbled slightly and when he got behind a car I noticed blood where he’d been.
“Void tunneler!” he called out. “Fuck!”

Naturally, the words meant nothing to me. I carefully watched the cars for movement, which was how I just barely had time to duck out of the way of a brick thrown straight at my head.

**Skill increased: Dodge lvl 1!**

The guy with the sword wasted no time at all in jumping over the hood of the car he’d been hiding behind and trying to rush me. It might have worked if the brick had hit me, but I was able to recover quickly enough to point the gun at him and squeeze the trigger. Another little *thwip* and blood started pouring from his chest, but while he was staggered, he was still coming toward me. I squeezed the trigger a second time, but the pistol beeped at me.

Blood had quickly soaked sword-guy’s shirt, and I could practically see his heartbeat by the way the bloodstain was spreading in pulses. He started running toward me, heedless of his wound, and I backed up toward the auto shop, gun still held in front of me. I waited as long as I could, until he was less than five feet away from me, then shot him in the chest.

**Skill increased: Pistols lvl 1!**

**Fuchsia Coterie minion defeated!**

He toppled to the ground, dropping his sword and giving out a gurgling moan. I stepped forward and kicked the sword away from him, then turned and looked for his friend just in time to see the pipe coming down on my arm. I heard a snap of bone right when it happened (New Affliction: Broken Bone) and would have dropped the gun if I hadn’t been holding onto it with both hands. His follow-up hit me in the shoulder, but it wasn’t the shoulder holding the gun, and I angled the gun under my arm to shoot him point blank in the stomach.

He howled in pain, which gave me enough time to scramble back away from him. He tried charging me, the same as his friend had, but I was ready for it and kicked him square in the junk. I got a notification about unarmed combat, he collapsed on his side, and a squeeze of the pistol’s long trigger caused another *thwip* that made a hole just above his ear.

**Skill increased: Pistols lvl 2!**

**Fuchsia Coterie minion defeated!**

**Level up!**

The golden light came again, with a wind that blew errant bits of newspaper away from me, and I got that same glorious hit of ecstasy, like the opposite of getting hit in the face with a frying pan. It lifted me up, just a few inches, and when I came down the afterwash of it momentarily made me forget that my arm was broken.

At least, that was what I thought until I tried moving my arm. It felt perfectly fine, and delicate probing soon turned into rough probing as I tried to feel at where the break had happened. I closed my eyes and three seconds later was looking at my character sheet, moving my eyes to the side to switch screens until I got to the one labeled “Afflictions”. ‘Cowardice’ was still there, but ‘Broken Limb’ was nowhere to be seen.

Apparently all it took for me to heal from a broken bone was leveling up. I opened my eyes back up and breathed a sigh of relief. When I had been in 6th grade I had broken my arm doing a stupid BMX trick and spent eight weeks in a cast, which had made the summer one of the most boring in
my life. Out here, I figured that a broken arm was basically a death sentence. If I hadn’t leveled up … well, it didn’t do to think about.

I looked down at the two bodies, then at the gun in my hand. It had been a clear case of self defense, but that didn’t really take the sting of guilt and horror out of it. I had no idea what the Fuchsia Coterie’s deal was, but even if they had meant to kill me I didn’t think that meant they deserved outright death. Their lifeless eyes were hard for me to look at, so I tried to focus on something else, which brought me to the glass jar still awkwardly sitting in my pocket. Right. I had a job to do.

The one with the pipe I had shot in the head, so I tended to him first. The spike was just slightly smaller than the hole my pistol made, so it was quick work to slip it in, and I was ready this time, so the soul fell into the jar without incident.

**Quest Progress: Seven Bells for Seven Hells, 2/7**

The guy who had been coming at me with a sword (a sword!) I had hit in the chest, and I wagered based on the angle that there was a good chance I had hit him in the heart. I stuck the spike, still red with the other one’s blood, straight into the wound and waited for a bit. Nothing immediately happened, so I grabbed my pistol, aimed it right at his forehead --

His eyes snapped open, both of them glowing with a red light. I pulled the trigger almost immediately, which opened up a dime-sized hole in his head, but I realized almost immediately afterward that these zombies didn’t care about their heads at all. I scrambled away from him and drew my machete, then realized what I was standing next to, dropped the machete, and picked up the sword instead. As soon as the zombie got to his feet I was on him, stabbing forward through his chest right next to the hole I’d put in him. His eyes winked out and he fell down, again. I watched him for a moment, breathing heavily. After a brief second to think, I picked my gun back up, went over to the one with the pipe, shot him right in the heart, then went back to collect sword guy’s soul, praying that it would still be in there after he’d turned zombie.

**Quest Progress: Seven Bells for Seven Hells, 3/7**

*Halfway done,* I thought to myself, and even though that wasn’t actually true, it made me feel better to say it.
Reaver

Look, you probably want to hear more about the sexy motorcycle mechanic or the punk gangs or the giant zombie creatures, but before we go too much further, I need to tell you about my D&D group. I know, I know, but so much of Aerb is a reflection of my scribblings while DMing, so there is a point to this. I’ll try my best to keep it to what’s important.

To start with, “D&D group” is probably a misnomer, because we played a lot more games than just D&D, and the group had a Ship of Theseus thing going on where people came and went until Arthur and I were the only constants, and then eventually it was just me. The only real point of continuity was the Collection. The Collection actually predated the group; when Arthur’s brother had gone off to college, he’d left Arthur with two dozen source books for various tabletop RPG systems, though about half of them were for D&D. We’d added to the Collection over time, keeping our names in the books and sometimes taking them home with us, but for the most part the Collection stayed at Arthur’s house, taking up first one, then two sagging bookshelves in his downstairs den.

Arthur was the backbone of our group. Even when he wasn’t playing a leader, he would take point and ensure that the plot kept moving forward. He was a total geek, but he knew that he was a geek, and didn’t seem to care what anyone else thought about him. When we played, he was usually the only one to put on a voice and stay in character. I was the one making the worlds, but Arthur was the one that really made them come to life, because he had this ability to just instantly invest himself in whatever was presented to him.

More than that, he could read me really well. It was my habit to get an idea in my head and start up a campaign with reckless enthusiasm, then get bored of it after a few weeks and keep chugging on without really feeling that spark of inspiration anymore. Arthur was always the one to bail me out, to say “How about we try something new next week?” without ever calling attention to the fact that I had lost the thread. The first few times he did it, I just breathed a sigh of relief, not noticing that he had been acting in my interest. He was a great guy, super busy with basically every non-athletic activity that our school offered (academic decathlon, mathletes, mock trial, yearbook, etc.), but always there for me despite that.

In the summer of our junior year, Arthur was taking his station wagon through an uncontrolled intersection when he got T-boned by a truck going twenty miles over the speed limit. He spent eleven days in a coma, then died from complications.

There were times, months later, when I would be eating lunch in the school cafeteria and turn to tell him something, only to realize my brain had been running on auto-pilot and he wasn’t there, and would never be there, and whatever dumb thing I had wanted to tell him was just going to get added to the stack of things that he was never going to experience. I’d used to think when people talked about death leaving a hole, they were talking about roles and responsibilities, but after Arthur died I started seeing it in a different light. It was more that he had become a part of me, a person so important to my life that my interactions with him were on the level of instinct. With his death, a long stretch of wiring in my brain became faulty.

Anyway. The Collection moved to my house. His parents offered to let us keep using their den, but my mom told me that it wouldn’t be good for them to have their dead son’s friends coming over twice a week (and yes, those were pretty much her exact words). We kept on playing, though it obviously wasn’t the same. Arthur had been the group’s de facto leader, but now that duty fell on my shoulders, and not only was I the one making things up and running the game, I wasn’t in the best mental state.
I’m telling you this because Aerb had features that were stolen from my D&D games, and all the stuff I was most scared of came from the post-Arthur era. Fel Seed, Nightsmoke, the borogoves, the mimsies … I sent the party into the thresher because I was angry at the world. It was more than just making the encounters too hard and the world unfair, it was beyond the fact that everything I made was grimdark, it was the hopeless despair that infused everything. I introduced villains whose evil couldn’t be undone, where their murder would just be a matter of futile revenge and the world would never be set right.

And now, I was worried I was going to have to face them.

Having collected the souls from the men I had killed, I stopped to take another look at my character sheet. Again there were two points to spend as I pleased. I looked through the other pages but saw nothing, except that the “Companions” page listed “Amaryllis” with a zero next to it and a box below that was greyed out. At least that was a testable prediction, and if it turned out to be her name, then that meant there would probably be a few instances where the game would give me hints or information ahead of time.

It was tempting to put the points into WIS and POI, given that both of them were sitting at one point each and I didn’t know what would happen when they reached zero … but that would be woefully inefficient given that neither was as likely to save my life as the physical abilities were and I wouldn’t get the bonus. So instead, I sunk both my points into raising PHY by one, which raised POW, SPD, and END as well. This time I was alert and aware of my body; I felt the change go through me. It was like straightening up and giving yourself good posture, but without actually changing how I was positioned. I didn’t have much fat on me to start with, but I felt it melt away, and my muscles tightened slightly as they grew. I also felt slightly taller; I wondered whether that would keep up if I kept increasing my physical abilities.

I left the machete where it lay on the ground and hefted the sword. It was a shortsword, with about a foot and a half of blade, a curled crossguard, and a wrapped leather grip. The Fuchsia Coterie hadn’t had any weapons when they came down, at least not that I’d seen when we were all falling, and even if they had I would have found the sword to be a bit incongruous, the same as stone buildings with thatched roofs. It seemed like lazy world-building. If you had mass manufactured plasterboard, two-by-fours, and asphalt shingles, then you didn’t also see buildings that looked like they had been mortared together out of field stones and thatched roofs, not unless they were there for the tourists, and Comfort didn’t seem like it had been much of a tourist location. Similarly, no one but weeaboos and fantasy geeks had swords if there were pistols, not unless there was something like the Holtzman effect from *Dune*.

The sword didn’t weigh much, but while I had been able to slip the machete through my belt, I was worried that the sword was sharp enough to actually cut. I picked the pistol back up in order to feel what it would be like to hold one in each hand.

**Skill unlocked: Dual Wield!**

But just feeling them, I knew that it was basically idiotic to try to fight with both at once. What I needed was a sheath or a holster, preferably both, and a backpack in order to have a more convenient place to hold my jar of souls. That basically made my next decision for me; it was time to find the shire-reeve’s office.

The town of Comfort didn’t have particularly stalkable streets. There were alleys, but they were wide ones, and except for the main street, the buildings were spread from one another with narrow strips
of sidewalk between them. There were cars lying abandoned in the streets, the same kind I’d seen at the gas station with convex hoods, and most of the frontages were wrecks of broken glass. There wasn’t any sign of clean-up, and no visible attempts to repair the damage to be seen. Whatever had happened here, it had been fast. I had seen ghost towns before, but most of them developed slowly as people moved away and businesses failed for lack of customers.

The building I was looking for was sitting right next to a small, two story courthouse. It only vaguely resembled the courthouses back home; the whole thing was like a pyramid with its top cut off, and instead of faux-Greek columns it had arches coming down from the top and arcing into the ground. The flagpole with a tattered bit of red still hanging to it and large bronze statue of a man were enough that I was fairly certain that it was a courthouse.

I had no idea what the governmental structure of the Risen Lands looked like, but Comfort, though small, followed a pattern I was familiar with. It was surrounded by farms and farmlands, far away from any other town. The whole point of this town existing was that the sparse population of the surrounding area needed a place to go for the essentials they couldn’t grow or make on their own. I was certain that there was a store with farming supplies somewhere, and a hardware store where someone could get some nails and a replacement hammer. But a town like Comfort wasn’t just going to be a collection of shops and the houses of the people who worked in those shops, it was going to have government services as well. Hence, a courthouse, so looking up the deed to a parcel of land or a marriage certificate didn’t take a six hour round trip to whatever the local equivalent of Wichita was. I knew based on the size of Comfort that it was bound to have one -- but it wasn’t the courthouse that I was looking for, it was the shire-reeve’s office next to it, because if a farmer needs legal services to be within a half hour’s drive, then he definitely needs a lawkeeper at least that close.

(Again, 2 KNO was bullshit.)

The other reason that I thought it would be here, aside from deductive reasoning, is that I included shire-reeves in pretty much every game I ever DMed. Shire-reeve is just an archaic way of saying “sheriff”, but I thought it had a particularly fantasy feel to it, and it revealed the etymology of the word in the process, which was a personal joy of mine. The place I was looking at had a symbol of a triangle inset with a mushroom instead of the pointed star that sheriffs in America used, and the coloring of the cars out front was light blue with black stripes. There was no reason that they would necessarily be called sheriffs, let alone shire-reeves … and yet as I edged closer to the building, I was able to make out the faded lettering stuck to the window, which did indeed say “Aleister Duchy Shire Reeve’s Office”. Huh.

The glass door was broken and a corpse lay halfway out of it with shards digging into his gut. The blood was fresh, which meant that it was at least relatively recent. I stepped closer, holding my pistol in my right hand and trying to watch the windows around me. The two guys I had come across had melee weapons instead of guns, which I took as a hopeful sign. I wasn’t really interested in a gunfight unless I was the only one that had a gun. On the other hand, Cypress had said that she made the gun (with a box of scraps?) which meant that maybe other people could make them too.

I made it to the body without seeing anyone and bent down next to him. Everyone I had seen on the plane was at least as young as me, and this guy was no exception to that rule. I didn’t recognize him, but I didn’t expect to. With a grimace I raised the void tunneler and shot him in the head. Watching carefully, I could see that a hypothesis I’d had was correct; it wasn’t actually shooting bullets, just making holes by some other means. Knowing that wasn’t immediately helpful and raised more questions, but questions on top of questions were pretty much par for the course at this point. I slid the spike into his head, hoping that I would get another easy one.

*Quest Progress: Seven Bells for Seven Hells, 4/7*
I breathed a silent, shaky sigh of relief as I screwed the cap back on my glass jar and rearmed myself.

I had no illusions that the shire-reeve’s office would be unlooted. It was the first place that anyone who had landed in Comfort would go. Whatever weapons and body armor they had on hand would have been taken by people who had gotten there faster than me, and if the Risen Lands had been used as a dumping ground for undesirables long enough that Cypress could accurately quote one-in-one-hundred as making it out … well, that meant the chances of usable weapons being in the shire-reeve’s office was basically nil. People would have taken them, then people would have died to whatever terrors stalked the night, and the weapons would have been scattered to the winds.

That still left the other stuff though. I wasn’t confident that I’d be able to find a holster to fit the boxy gun Cypress had (apparently) made, but I was a little more hopeful about finding other things on the long list of things that I’d prefer to have before we left Comfort.

I also had grimmer business here. I still had more souls to collect before I could return to Cypress and have her fuel the soulcycle, and if I wanted to avoid conflict (which I really, desperately did) then that meant finding people who had recently died. As evidenced by the corpse through the door, any place that multiple people had the bright idea to go to was bound to be somewhere I could find work as a vulture.

I swept into the front office, dual wielding even though it felt ridiculous. There was a reception area with a desk that was covered in papers. A corpse sat at the chair there, but it was so old that the skin was shrink-wrapped to the skull and the wispy strands of remaining hair had gone white. I gave it a thwip with the void gun just to be sure, but it wasn’t so much as twitching. A calendar behind it showed a picture of a tall white spire sticking up out of an island that was barely larger than its base; I recognized that almost immediately as one of the White Spires from my Drowned Valleys campaign setting, but didn’t stop to take it in. The name of the month was, apparently, ‘Halig’.

I kept on going, keeping my eye out for people, bodies, and zombies. One of the offices had a long-dead man in it with a visible wound where his heart had been pierced, but at his hip was one of the things I had been looking for: he was wearing a sheath for a short sword. I took it off him as carefully as I could, but he slumped to the side and his head fell off in the process. It was the work of a few minutes, but I was happy (and slightly surprised) that my sword actually fit the sheath. I tied it so that it hung from my hip and practiced the draw a few times.

I moved slowly through the shire-reeve’s office, keeping an eye out for the safe that would probably hold their guns and other equipment. I was trying to keep quiet, in case there was someone here (since, after all, the corpse out front had been less than thirty minutes old) --

**Skill increased: Deception lvl 2!**

I froze as soon as the message came up. I had initially unlocked the skill when moving through the mechanic’s shop, and gained a level in it when I’d lied (poorly) to Cypress. Seeing the skill up meant one of two things. The first option was that trying to sneak across Comfort slowly incremented some hidden variable that had only now rolled over. The second option was that my skills only increased when they were actively used for something … and Deception had gone up because someone was close enough that the skill was actually being applied.

I backed up into the corner of the empty room I was in and hid behind some filing cabinets, trying to keep my breathing shallow enough that I wouldn’t make any noise. The sword and gun together felt incredibly awkward and after a brief moment of deliberation I slipped the sword in its sheath, very conscious of the sound the metal made against the leather.

**Skill increased: Deception lvl 3!**
I was listening closely, straining my ears to hear something. If the skill up was dependent on someone being close by, that made me wonder what the range on it was. Half a block? Less? The lack of sound either meant that they were far away, or that they themselves were sneaking --

I saw the rifle poke into the room before I saw the person holding it. The barrel swept from side to side and once that was done, another of the Fuchsia Coterie entered into my room. I was mostly hidden by the filing cabinet, but the further he moved into the room, the more exposed I would be. I leveled my pistol, aimed at his head, and fired. He saw the motion and turned but a hole was punched in his head, right through his nose. I got three notifications in rapid succession, each with their own chimes, which almost covered up the sound of crunching glass and a creaking floorboard from outside the room.

I ducked down but stayed behind the cabinets. The guy laying on the floor had long pink hair done up in a bun; he was shaking as he bled from the hole in his head, like he was having a seizure. His rifle lay on the ground next to him; it was much more traditional looking than the pistol I held, with the exception of the curved magazine that came out from the top rather than the bottom and a faintly glowing red symbol on the side.

The situation wasn’t great for me. Someone was outside the room, maybe multiple people, and I had roughly three minutes until the guy on the floor rose up as a zombie. So far as I could tell, there wasn’t much of a risk to them of simply waiting me out. The room did have a grimy, half-broken window to the outside, but that wasn’t going to help me since I’d get a knife to my back as soon as they heard me trying to open the window. Baiting them out seemed like my only option, but before I could do that, someone threw a small purple crystal into the room.

It was connected to a small, dime-sized battery with some wires and what looked like chewing gum. It landed right next to the body. I ducked behind the filing cabinet on instinct, before the thought grenade even had the time to go through my head, I think processing it more by the way it had been thrown than what it looked like.

The explosion was small and subdued, but the effects were immediate as things started falling down around me. The carpet and floorboards were missing near the center of the room, and a quick glance at the body showed only a thin wet strip of it left. The far wall of the office was mostly gone, not blown away but simply vanished with no debris. Without giving myself time to think, I darted forward out of the hole the grenade had made, feeling a cold wet sting on my shoulder as I did so, looking around wildly to see whether there were any threats in sight. When I was covered by the wall I turned around toward the hole I’d left out of and raised my pistol, just in time to shoot the guy coming through in the chest. He grunted at that but raised his own gun toward me after I’d thrown my pistol to the ground, just as I was trying to draw my sword.

**Skill unlocked: Parry!**

**Skill increased: Parry lvl 1!**

I got the messages in time with the explosive sound of gunfire, a painful jerking of the sword in my hand, and the clanging sound of a bullet hitting metal. I lunged forward with my sword and stabbed the guy in front of me in his arm at an awkward angle (especially because I had been aiming for his chest). Blood was pumping out of his chest, soaking his shirt, and his breaths had a raspy gurgle. I sliced at his arm with my sword again as his pistol came back toward me and felt it hit bone. When he tried to scream, blood came out of his mouth, and he fell backward.

I grabbed my pistol back up off the ground and aimed it toward the hole in the wall, but no one came through it. I was breathing hard and my back was getting increasingly wet, presumably with blood if
the stinging pain and exposure to the open air I could feel on my shoulder blade were anything to go by. I risked a glance back and saw that a palm sized piece of my shirt was gone, along with all the skin underneath it.

I crept forward to the hole and peeked inside, gun leading the way. The office was a wreck. The fronts of the filing cabinets had been removed, as well as most of the files in them save for a few papers at the back. I could see where I’d been standing, how the filing cabinet had been instantly eaten away there, making a hole that was almost exactly the size as the stinging wound on my shoulder.

I took a moment to go back to the guy outside and shoot him in the heart, not wanting to risk a zombie creeping up behind me, and while I was at it I stuck the spike in as well. There was very little left of the corpse inside the office; I tried sticking the spike against part of his skull, but there was no glow and eventually I gave up. When I moved into the hallway though, I found a surprise: there was a third pink-haired member of the Coterie, holding a sword and quite dead. Most of the wall around him had been destroyed by the grenade, save for a few places where there were something approximating shadows. I guessed that electrical wiring or plumbing must have blocked some of it, but not enough to save this guy, who had at least an inch of flesh removed from him in a number of places, including his skull. I shot him in the heart to prevent him from rising and collected his soul as well.

*Quest Progress: Seven Bells for Seven Hells, 6/7*

That meant one more to go before I could return to Cypress. I did wonder why it had to be seven instead of six or eight; she hadn’t told me and I had stupidly not asked. If the souls were fuel, did that mean we needed seven to get to wherever we were going? She was too pretty, that had been my problem. That, or not enough clear-headedness on my part. It had been distinctly hard to think around her.

I swept through the remainder of the shire-reeve’s station I hadn’t covered. The only weapons I found were those that belonged to the Fuchsia Coterie; the rifle had been almost completely destroyed by what I was pretty sure had been a void grenade, while the pistols fired conventional bullets and seemed worse than what I had. I changed my mind on that score once I found an empty holster attached to the corpse of a decaying husk. It was too narrow for the void tunneler, but I didn’t mind carrying around the extra weight of another gun, so long as it was on my hip.

Most of what the station held were papers. I didn’t have time to give them much more than a glance, even though I was burning with curiosity about this world, not just because it would have an impact on my chances for survival, but because of what Cypress had called narcissism. There were so many elements of it that I recognized as mine. I was afraid of the things I had dreamed up, true, but I wanted to see them all the same, to see the fingerprint of my mind impressed on this place. Annoyingly, the only newspaper I found covered only the goings-on of Aleister Duchy, and while there were hints to other things, mentions of the Cradle King and the Barber’s Edict (both of which I recognized), it was written for people who would already know the basics.

The stripped-off skin on my back didn’t quite crust over, but it at least dried into a sticky patch of blood on top of the raw meat of my shoulder. It hurt more as time went on and I knew that the next fight I got in would be worse for it, because every quick movement on my part would send a shock of searing pain through it. The game layer didn’t seem to indicate any sort of health point, only sufficiently bad afflictions, and apparently this one didn’t rate an entry. The back of my shirt was clinging to me where I had bled.

I walked out of the shire-reeve’s feeling exhausted, in part because the adrenaline of the fight had
faded and in part because of blood loss. I hadn’t eaten since … well, since I had eaten a hamburger and fries in the cafeteria of Bumblefuck High School, and I wasn’t sure that counted. I hadn’t had any water in nearly as long.

So when the thing made of thirty corpses came around a building and almost instantly snapped its faux-head around to look at me with burning red pits framed by dismembered arms and legs, I was terrified, certainly, but a part of me thought that I wasn’t going to have enough energy to escape. I turned and ran, back into the shire-reeve’s office, hoping that I would figure something out.
Goraion

It wasn’t anything more than a collection of corpses, not that I could see. There was no stitching holding it together, no barbed wire running through it, and not even any visible strands of unearthly purple light. It wasn’t clear how the corpses were stuck to each other either, since they weren’t gripping each other, and there was no real rhyme or reason to their arrangement. I had no idea how it had been made or formed, but at a good approximation someone had taken a giant mold of a creature with four nominal limbs and poured corpses into it. Some of the pieces that made it up still twitched.

I had already given some thought to how to kill it. The zombies were killed by either puncturing or otherwise destroying their heart, but this thing didn’t seem like it would have a clear analog, and even if it did have one it would have been buried behind at least a foot of flesh. The void tunneler seemed not to leave much in the way of an exit wound, the ballistic pistol didn’t seem like it would be much better, and even if I could stab Zombie Voltron up to the hilt with the sword, I put low odds on that working. Which left … not a lot, actually. The power lines in Comfort were dead, so I couldn’t shock it. There were presumably no working cars, so I couldn’t run it over. I hadn’t seen any pits I could (somehow) push it off, no conspicuous cliffs, no lakes to drown it in, and not much in the way of flammables to (again, somehow) burn it down. The only likely thing I had seen was the grenade the Coterie had thrown at me and I didn’t know how to get one of those.

If this were a videogame, I would have pounded my head against a boss creature like this for at least an hour, trying different strategies until I had sussed out the patterns of attack and could manage to grind it out. If this were a tabletop game, I would have killed the party for trying to go up against something that I’d given them several hints was beyond their level. Either scenario ended with death for me, and I wasn’t about to count on getting extra lives or the chance to roll a new character.

So I ran, fervently hoping that I wasn’t going to get another level of “Cowardice”, fall into a stupor from having 0 WIS, and get devoured.

I heard bricks and glass crashing down as Zombie Voltron chased after me down the hallway of the shire-reeve’s station. I hooked left into the room where I’d had my little battle with the Coterie and gave a brief glance backward. As I’d hoped, Zombie Voltron was being slowed down by the need to tear his way through the walls like a goddamn maniac. I jumped over the floor that the grenade had wrecked but landed awkwardly and felt a sharp pain in my ankle just before I tripped and tumbled to the ground.

Critical failure!

New Affliction: Sprained Ankle lvl 2! (SPD -2, Athletics -5, Dodge -5)

I hobbled to my feet, trying to ignore the pain, and began limping forward as fast as I could. It was my left ankle that I’d hurt. Each step felt like I was jamming a nail into my ankle, but I could hear Zombie Voltron behind me as it wrecked its way through the building and I didn’t have much of a choice. When I’d first come into town I had seen it chasing after people and it seemed like they had been faster than it, but with my ankle all fucked up I thought my chances were basically dogshit. Across the street was a building helpfully labeled “Pet Store” with the door hanging half off its hinge, and having no better option, I trundled toward it.

Zombie Voltron had broken out of the sheriff’s office, hopefully twisting his own ankle in the process. He was a lumbering creature, his “feet” nothing more than haphazardly positioned corpses. They were falling apart, not because they were rotting but because every step he took crunched bones and tore at dead flesh.
The pet shop was a nightmare of glowing red eyes, all of them looking my way. I didn’t stop to look at any of them, but those red eyes shone from aquariums with little hamster wheels, habitats with driftwood and fake leaves, and looked at me by the hundreds from murky tanks. I limped past them all, trying not to seize up at the sight of them, motivated by the crashing sound behind me as Zombie Voltron made contact with the shopfront. (I couldn’t help but wonder if the pets had been turned by whatever apocalypse had hit Comfort, or if they had all starved to death in their cages and then risen as zombies after the fact.)

I limped through a doorway with a tattered curtain over it at the back of the shop, then through a stocking area with boxes loaded high, and finally out a door back into the overcast daylight. I stopped when I realized that I couldn’t hear anything behind me. Well that’s ominous. The back of the shop had a small little parking area and loading zone, and beyond that was a wide alley. That meant there was a row of shops between myself and main street, then another two blocks or so to the auto place where Cypress was waiting. I swallowed hard and started limping, trying not to grunt in pain with every step that I took.

“Pssst!” came a voice from one of the buildings in the alley. I spun around and pointed my gun in that direction, but was able to stop myself from firing. There was a boy hanging out a window, leaning over so he could see me. To my surprise, I recognized him. He was the one who’d been shouting about how we were all in this together right before we’d dropped. “Come here!” he whispered, loud enough that it carried.

I limped over to him, holding the trigger-handle of the gun so that I could move it up and fire at a moment’s notice. The pain in my ankle was getting worse, and I could feel fresh blood dripping down my back.

“Inside,” he said, and when he did the door near him opened up. I limped over to it, cursing under my breath.

I was instantly suspicious. I had always been one to look a gift horse in the mouth, ever since my grandmother had told me there would be candy at church and made me sit through a two hour sermon in order to get it. Of course, the root of the saying was more about the appearance of propriety, since I don’t think anyone expected you to just ignore equine dentition altogether. They’re grazing animals, their teeth are important!

There were two people ducked down in the back of the clothing store, one a pallid boy clutching a stomach wound and the other a girl with a scar running from the side of her mouth to just below her ear. She was the one who had opened the door for me, and she closed it quickly as soon as I was in. She spared a glance at my ankle and a longer glance at my weapons, but said nothing. From a different room, the guy who had called to me from the alley crept in. I guessed he was about my age, blonde and muscular like a Nazi recruitment poster. He gave me a strained smile and held out his hand.

“Poul,” he said.

I shook his hand slowly. “Joon,” I replied.

“This is Becca and Sly,” said Poul, with a gesture first to the girl, then to the boy.

“Sly’s not going to make it,” said Becca. She sat down and grabbed her knees. A dagger was stuck in the floor next to her.

Sly gave a weak laugh. “It’s true,” he coughed. “Gonna get added to the undead army.”
Poul grimaced at that. “We’ll find a way,” he said, but he didn’t meet Sly’s eyes when he said it. He let the silence linger for a bit, then turned to me. “The Host dropped a gang with us, as if the Risen Lands weren’t bad enough.” He looked down at the makeshift pistol in my hands, then the sword at my side and pistol at my hip. “You look like a dangerous guy.”

“Not in my current condition,” I said. “Plus even at peak condition I don’t think I could take on the moving mountain of corpses out there.”

Becca was staring at my weapon. Her scar was clearly deep, because her frown was only present on half her face. “What weapon is that?” she asked.

“Void tunneler,” I said.

Poul winced and Becca sucked air through her teeth.

“I shouldn’t be surprised,” said Poul. “The Exclusion Zone predates the Imperial ban.” A forced smile crossed his face. “That confirms you as a dangerous guy then. Did you build it?”

“Yes,” I said immediately.

Skill increased: Deception lvl 4!

It’s pretty hard to maintain a straight face when a message suddenly pops up in front of your face calling you a liar. I decided then and there that I would level up Deception as quickly as possible, if only so I’d stop getting startled by it.

(I should hope that it would be obvious why I lied. I didn’t trust these people yet, and even if I did, that didn’t mean that I could betray Cypress’ confidence. More to the point, the motorcycle we had could take two people at most out of Comfort, and that would give them an incentive toward betrayal.)

“What’s the play?” I asked, mostly to switch topics.

“There is none,” said Becca, but Poul was already shaking his head.

“There are two fronts right now,” said Poul. “That works to our advantage, so long as they’re killing each other. A defensive strategy is the best option, since our odds get better with every kill on either side.”

“Convenient that it also means taking the least risks,” said Becca. “We’re going to starve to death.”

“We can forage,” said Poul.

“No,” coughed Sly. His voice was weak. “My uncle did the math, sent it to me in prison a few days before we dropped.” He was noticeably more pale than when I had first come in. “Graduation rates have been steadily dropping, month after month, year after year. It’s getting harder for anyone to leave the Risen Lands. Reports from those who make it back are that most of the food that was still good has been eaten through. Any car that worked got taken early on, there’s no one to drive them back into the --” he coughed and waved his hand, then kept coughing until blood started coming up from his lips. I kept waiting for him to stop, but he kept going, until Poul moved over and laid a hand on his shoulder. When Sly eventually stopped coughing though, he just lay there, not moving to wipe the blood from his mouth. His chest had been heaving with the heavy breaths he was taking, but now it was completely still.

“Shit,” said Poul.
“He’s going to rise,” said Becca. Her words were soft, as though uneager to leave her lips.

I raised my void tunneler. “Move aside,” I said. I limped forward and aimed carefully as Poul backed up and got behind me. The *thwip* seemed louder than usual, but that might have just been my imagination. I stared at the clean hole I’d made, the flesh that had vanished from his body.

Maybe I’m a bastard, but my first thought was, *Well, that’s the seventh soul I need.*

“Fuck,” said Becca.

“I don’t know any last rites,” said Poul.

“Me either,” said Becca. She reached into the pocket of her jeans. “I picked up a few coins though. Thought we might need an obol.” She handed a silvered coin the size of a half-dollar to Poul, who opened Sly’s mouth, slid the coin inside, then closed his mouth again. He turned to me. “Last rites?” he asked.

I swallowed and focused on the body. “May your darkness turn to light. May the burdens lift free of your immortal soul. May you swiftly find your way to heaven and thereby find your peace.” I didn’t think that I’d made a total hash of it, but I noticed movement to the side and saw Becca pulling her dagger from the floor.

“What the *fuck* is heaven?” she asked me with gritted teeth.

“Calm down,” snapped Poul. He turned from her and looked me over, as if seeing me for the first time. “That was certainly … unorthodox.”

“Sorry,” I said quickly. “I didn’t … I’m not from here, I’m dream-skewered, I don’t know … I’m sorry. I didn’t mean it.”

“Fucking cultist,” spat Becca.

“We need to work together,” said Poul. “You’ve noticed that he’s the guy with the weapons, right?”

That stung a bit. I really should have just been smart and said that I didn’t know any last rites either, but I had thought about my years and years of playing different roles as DM. I was fairly certain that I had made up last rites on a few different occasions. Apparently though, instead of bringing comfort to the two of them, I’d made myself look like an ass. The glass jar in my pocket, the one with six small white souls floating in it, felt especially heavy and awkward. I wondered what their reaction would be to that; Becca had been nearly ready to kill me for saying the wrong prayer.

“We still need to decide what we’re doing,” said Becca. She stood up and looked out over the racks of clothes to the street outside, then quickly ducked down. “Undead have gotten thick. And like it or not, it’s going to be easier to move without Sly.” My ankle throbbed at the mention of moving.

“We can at least wait a day,” said Poul. “That’s enough time for them to stop wandering the streets.”

“The Coterie are here for a reason,” I said. I gently massaged my ankle, which had become swollen and tender. “Whether it’s their purpose or not, they’re hunting.”

Poul and Becca shared a glance.

“Say that again, but slower,” said Poul.

“They’re here for a reason,” I said. I could feel myself blushing. First the thing with the last rites, and
now they were looking at me like I’d grown a second head.

“You said Coterie,” said Becca. “As in the Fuchsia Coterie?”

“Yes,” I replied. “Part of the Color Riot, I think?” The term ‘dream-skewered’ seemed to mean nothing to them, which was a problem. I’d gotten lucky that Cypress had been the first person I met.

“Motherfuck,” muttered Becca.

“Bad enough when we thought it was a gang,” said Poul, shaking his head. “But I still think we should stay put. There’s no reason the Color Riot would send one of their cohorts here … Hells, to slip them onto the plane under the Host’s nose? They wouldn’t do that if they were just trying to kill us. And if it really is the Fuchsia Coterie, then we can’t afford to tangle with them.”

I shook my head. “I don’t know what sort of stories they tell about these people, but I’ve already killed four of them. Five, maybe, depending on how you count. There can’t be that many of them left.”

“Who the fuck are you?” asked Becca. The color had drained from Poul’s face.

“There’s a safe place I know of,” I said, ignoring Becca’s question. I looked toward main street, and though my view was obscured, I could hear the milling horde. “And while I may be too slow to make it there right now, I think there’s a way I can fix that.”

“He’s insane,” complained Becca.

“He’s well-armed,” Poul countered. “Do you think he would have gotten to this point if he were crazy?”

“Yes,” said Becca flatly.

“Well if that’s the case,” I said slowly. “It’s at least a beneficial form of insanity.” *Dream-skewered.* “You can leave and we can meet up later, but I think that’s riskier.”

“We run at the first sign of it going south,” said Becca. “We’re not going to wait while you’re overrun and we’re not going to help you.”

“Deal,” I said. I stood up and limped toward the front of the store. The zombies didn’t see me right away, which gave me some time to level my void tunneler at the nearest one, aiming right for the center of his chest. I had to put some weight on my ankle, which was painful, but I was hopeful that it wouldn’t be for too much longer.

*Thwip.*

**Skill increased: Pistols lvl 4!**

**Zombie defeated!**

I had been trying to ignore the messages as much as possible, mostly because they didn’t help me at all. The character sheet clearly did do something, but it was frustratingly vague and clearly didn’t represent all the game mechanics, especially considering that I didn’t even have hit points or a health bar. (And I did briefly wonder how I was supposed to tell how close I was to death, until I thought *just like you did back on Earth, dummy.*)
Thwip.

Thwip.

Zombie defeated!

I learned something useful, which was that the void tunneler took four seconds to cycle. I had been careful with it, not wanting to push it too hard for fear of it irrecoverably breaking, and had elected not to do tests with it for that reason. Here, though, I had some ability to control the circumstances of this fight. More of the zombies had turned toward me as my pistol kept making its little sound, but the windows to the clothing shop weren’t floor-to-ceiling and the zombies would have to negotiate a wall to get to me.

“You said you had magic,” said Becca.

I ignored her and set my sights on another zombie. They were slow, but still walked at a decent speed, which meant that firing on them was still somewhat difficult. If I could have aimed for the head it might have been different, but my target was their heart, which is quite a bit smaller.

Thwip.

Zombie defeated!

I had now killed three zombies and two members of the Fuchsia Coterie since my last level up, and I thought I had to be close to level four. The zombies were unfortunately starting to mass toward me, and I seemed to have underestimated how many of them there were. With a start I recognized one of the zombies; he had a split in his jeans right at the crotch, and I remembered seeing him back by the gas station. That meant the horde trailing me had caught up and dispersed into Comfort. Frick.

By the time I had killed three more, I was starting to get worried. I glanced back and Becca and Poul and saw that both of them were standing by the doorway, with Poul keeping watch to make sure the coast was clear and Becca staring daggers into my back. I saw her eyes widen briefly and snapped my attention back to the storefront, where the zombies were starting to behave differently.

Where they had been pressed up against each other before, now they were starting to coordinate somewhat, crawling over each other or shifting out of each other’s way. The crowd was forming a tight knot of zombies that seemed more concerned with each other than with me, their movement slightly away from me, in fact. I realized what was happening just as I fired my pistol again and killed one of the closer undead. There wasn’t really anything that I could do about it at that point though; the undead were fused together, lifting up their makeshift torso, and spreading their fused together limbs. Zombie Voltron 2 was slowly coming to life.

Thwip.

Critical hit!

Skill increased: Pistols lvl 5!

Zombie defeated!

Level up!

I was ready for the heady rush of leveling up this time and I leaned into it, taking a huge breath as it hit me, tasting the honey-flavored wind that rippled the tattered clothes still hanging on mannequins
in the store. When it had passed, the ache in my ankle was gone and my shoulder was unblemished.

I ran from the zombies just as two of them toppled over the wall and into the store. Becca was staring at me with an open mouth as I rushed toward her, but she managed to pull herself together enough to beat me out into the alley. The three of us ran together; I had given Poul my ballistic pistol, mostly because he kept insisting that if I was killed by the zombies the two of them would be nearly defenseless.

There was no crashing sound of the clothing store being destroyed, but we kept running all the same. It was two and a half blocks to the auto shop, which I had reluctantly told Poul and Becca about. I was still short a soul, but hadn’t dared to try taking it from Sly’s corpse with both of them there, not after the way they’d reacted to my attempt at last rites. (This was cowardice or caution, depending on how you defined things, but the game layer didn’t count it against me.)

We kept to the alley, darting across the street at full speed, past zombies shambling around as their glowing red eyes turned to track us. We were halfway down the next block when an enormous figure lumbered into view at the end of it. For a second I thought that the second Zombie Voltron had somehow outpaced us and cut us off at the pace, but with dawning horror I realized that the configuration of corpses was familiar. This wasn’t the one that had just come together, this was the original. Which meant that Zombie Voltron 2: Electric Boogaloo -- yes, a quick glance confirmed that it was behind us, moving to block the other end of the alley.

“Left!” I called, and darted off down one of the thin sidewalks that threaded between buildings. Poul was just after me, with Becca after him, but as I looked back at her I saw her shirt snag on a bent piece of pipe that was sticking out of the ground at an awkward angle. It ripped her shirt but yanked her backward in the process and she fell to the ground, slamming her head on the cement.

This was the moment that I had been dreading. If I’d had to take a stab at what the rule for Cowardice was, it meant not helping people in need in order to increase my own chances of survival. I turned back toward Becca and sprinted, sliding past Poul as he kept running. My void tunneler was in hand and pointed to the alleyway. I reached Becca just as one of the Zombie Voltrons peered in at us. Up close, his red eyes were bright enough to be almost blinding. I shot at him with the pistol, thwip, hitting him right in his left eye, and though it winked out, I saw corpses slithering around each other, rearranging. My left hand was grabbing Becca by the leg and pulling her backward, out of harm’s way. Zombie Voltron’s arm-of-corpses wormed its way between the buildings and slammed down where her head had been a half second prior.

“M’ fine,” said Becca as I dragged her. Either she was surprisingly light or I didn’t know my own strength. I counted to four in my head, then fired at Zombie Voltron again. I couldn’t see the hole it made, and the creature made no reaction. Becca kicked at me and struggled to her feet, but when she tried to take a step she stumbled and slumped against the wall before staggering back up to her feet.

I moved beside her and got beneath her arm, draping it over my shoulder and holding onto her wrist. I was partly supporting her and partly carrying her. Any thoughts she might have had about protesting had left her and she tried her best to stay on her feet. The space between buildings was just barely wide enough for both of us to pass, but if we’d been shoulder-to-shoulder instead of hip-to-hip we probably would have been stuck.

When we got out from between the buildings, Poul was nowhere to be seen. I’d been terrified that the other Zombie Voltron would come around and box us in, but they didn’t seem to have that level of either speed or coordination. We were back out on the main street now, with rusted out cars and shambling zombies all moving toward us. Becca was putting more of her weight on me as I tried to think of what to do -- thinking that was cut short when Zombie Voltron came out from around the
buildings and began lumbering toward us. The way we’d come was blocked; the other Voltron was making its way through a space far too narrow for it, squeezing and wriggling to do so.

The one on the street charged us. I fired my void tunneler at it again, swearing as I did so.

**Critical hit!**

I had a moment of hope, but all that happened was that one of the corpses which made up the necrotic abomination fell to the ground. I had seen the hole this time, right through the chest of that zombie … oh. Piercing a zombie through the heart killed it, this creature was made up of zombies, therefore all I would need to do was pierce every one of its hearts to kill it. *One down, fifty to go.*

I slid the void tunneler into the waistband of my pants, lifted Becca up and slung her over my shoulder in a fireman’s carry, and started running. Running was probably a generous word for it, considering that I was carrying more than a hundred pounds.

I tried my best to weave between the cars, hoping that Zombie Voltron would have trouble navigating them and making up for my deficit in speed. I could hear it after me though, the wet slap of ruined corpse-flesh as it ran and the crunch of bones as it came down too hard. Judging by sound, it was gaining on me. The only point in my favor was that I was still moving toward the mechanic’s shop, where hopefully Poul and Cypress would be able to give me a scant bit of cover, but it was another two buildings to go and I was moving painfully slow. Whatever fight Becca had left in her was gone, and she was nearly limp against me, which made her all the harder to carry.

I heard a loud sound, very close behind, and risked a look just in time to see the end of Zombie Voltron’s arm coming toward me. The ruined mess of flesh that made up its feet was gone, replaced by a dozen grasping hands attached to arms that waved around.

It was too close to me, and I was too slow. One of the hands grabbed onto Becca’s forearm, and as soon as its grip was secure it yanked her away from me, other hands coming to join the first one, grabbing her throat, hair, shoulder, anywhere they could reach. I managed to grab hold of one of her legs before she could fall completely off my shoulders, but the mass of zombies pulled her away from me with a force that nearly pulled my arm from my socket. I lost my grip and watched in horror as the arm made of corpses whipped to the side, smashing Becca against a metal dumpster. The edge of it hit her in the spine and separated her body in two, splattering blood and guts against the ground.

“No!” I screamed.

**Affliction: Cowardice Removed!**

I could feel my pulse beating in my temples and my vision was starting to blur. I had been angry before, consumed with blinding rage, but it had never been so perfectly paired with adrenaline. With a shaky hand I yanked the void tunneler out and started to level it at Zombie Voltron … then I turned and ran, because that was the smart thing to do.

I swore as I ran, cursing the injustice of it, the raw unfairness of trying to do the right thing and seeing it all fall apart anyway. It was how I had felt after Arthur died, this furious anger at a world that was so indifferent to us, a burning desire to find God and punch him in his fat fucking face for letting a thing like this happen.

I ran until I thought I had lost them, then doubled back, keeping my eyes open. The rage was fading into a firm commitment that I would kill every single fucking zombie in this place before moving on. I’d grab this stupid fucking world by the neck and bend it to my will if I had to, I would mold and shape it against its protests until nothing was so shitty as that had been.
I’d felt the same way on Earth for about six months after Arthur died. This feeling was an echo of
that one, or maybe it had just dredged up those old thoughts that I had been starting to put behind me.
I had known Becca for all of half an hour, if that, and I had only gone back to save her in the first
place because I was worried about my own life. The part of me that wasn’t set on howling against
the world could see that this was more of an old scab being ripped off than a rational response to
Becca’s death, but that didn’t change how I felt.

I killed five more zombies as I snuck back to the mechanic’s, more because I was angry than because
they posed a real threat. The little thwip was unsatisfyingly quiet, though there was some satisfaction
to be had in the notifications that popped up. There was no sign of the Zombie Voltron (Zombies
Voltron?), which I was thankful for. It had taken an act of will to keep myself from standing my
ground and fighting them until they killed me. I didn’t see the Fuchsia Coterie either.

When I reached the mechanic’s shop, I heard someone say “Psst!” Poul stepped out from around a
corner and walked over to me, crouching as he did so. He was looking around and opened his mouth
to ask a question, but stopped himself.

“There were three undead at the door,” he said instead. He patted the pistol at his side. “I figured this
thing was a little bit too loud, didn’t want to attract too much attention, so I led them away then came
back. Are you … okay?”

“Yeah,” I said. “Becca didn’t make it.”

“Shit,” said Poul.

I moved to the door and opened it up. The smell that hit me was foul; the corpse sitting in the waiting
room had ripened. “Come on, I’ll make introductions.”

Cypress greeted me about the same way that she had when we’d first met; she had a new gun, a rifle
this time, which she pointed straight at me. She was crouched in a makeshift bunker of car doors that
she must have put together. I had forgotten how deeply attractive she was; that fact had become a
point of data in my mind which didn’t reflect the visceral pull she had on me.

“I heard a commotion outside,” she said calmly. “Were you followed?”

“No,” I said. “But I did bring company.”

Cypress jerked her head to the side, the universal sign for “move out of the way then”.

“I have a void tunneler trained on you,” she called to Poul as he stepped forward. “My trust in
Juniper, such as it is, does not apply to you.”

Poul made no response to that. He was staring at Cypress. “Holy shit,” he said.

Yes, that had been my reaction too, but at least I was polite enough not to say it.

I’d misread him though, because Poul went to his knees and bowed down. I raised an eyebrow at
that; Cypress rolled her eyes.

“Princess Amaryllis,” said Poul from the ground. “I pledge myself to your service.”
Cold Comfort

Poul’s prostration didn’t seem to gain him any favor with Cypress, now revealed as not just Amaryllis (as my character sheet had already informed me) but Princess Amaryllis. That raised a whole host of questions, most salient of which was how, exactly, she had ended up on a plane full of criminals.

“Juniper, the soulcycle can hold two people at most, and that’s with one of us riding pillion,” said Amaryllis. “It’s not clear to me that you’ve thought through the logistics of this.”

“I did think about it,” I said. “But I couldn’t leave them to die.”

“They?” asked Amaryllis with a raised eyebrow.

“Him,” I replied with a swallow. I wanted her to give me a sad look or something to show she understood the subtext and sympathized, but she focused her attention back on Poul.

“Name,” she said slowly. “So I know what to call you.” I don’t think it had escaped anyone’s attention that she still had her rifle trained on him. It made me nervous. I had been taught trigger discipline and gun safety growing up and this was a gross violation of that. Never point the gun at something you’re not fine with destroying. Or maybe she’s just fine with killing him. But I wanted it to be an act, a show of force covering softness.

“Poulus Cambria,” he said.

“Background?” she asked.

Poul was silent for awhile. “Soldier,” he finally said.

Amaryllis frowned at that. “How did you end up here?” she asked.

“I would prefer not to say,” he replied.

“Too bad,” said Amaryllis. Her finger was already on the makeshift trigger of the rifle and I saw it move slightly, adding pressure. I wanted that to be a bluff, a tactic to get him talking, but Poul was still kneeling, his face toward the floor, and the gesture would have been wasted on him.

“I was convicted of rape by a military tribunal,” he said.

Amaryllis pursed her lips. “That’s not a crime that often goes punished these days,” she said. “The General Council changed the law to require two witnesses in addition to the victim. Were there long deliberations, in your case?”

“No,” replied Poul.

“Well then,” said Amaryllis. “Juniper, is there any good reason that I should keep him alive?”

“He helped me,” I said, though as I said it I realized that it wasn’t exactly true.

“Rank sentimentality suits no one,” said Amaryllis. “Poulus, is there a reason you should live instead of die?”

He was silent for a long time, long enough that I thought Amaryllis would shoot him for not answering, but even though she was threatening him with death, she was doing so with patience
rather than knee-jerk malice. I hadn’t fully understood the background context of their conversation, but I gathered that Poul was guilty of the crime he had been charged with.

“The Coterie are here, my lady, and I believe they are here for you,” he said after a long moment. “There are undead stalking the Risen Lands, some of them beyond your own considerable abilities if you have no competent help. You have said that the soulcycle holds two? Well I would submit that I am a better companion than Joon. I have military training and before my disgrace I was well-decorated with high marks in --”

My mouth was hanging partway open when I realized what he was doing, and even then I had trouble articulating anything. I was saved when Amaryllis interrupted him.

“Shut up for a moment,” she said to him. “Juniper, how did you fare out there?”

I slipped my hand into my pocket and pulled out the glass jar. Six small greenish souls swam about in it, circling the magical spike I kept in there for lack of a better place.

“I have six of the seven,” I said.

“Under what circumstances?” she asked. She was still aiming her rifle directly at Poul, who had not moved.

“Two were scavenged from those already dead,” I said. “Another four were from … from the Fuchsia Coterie.” The killings still left a bad taste in my mouth. I’d acted in self-defense, but I couldn’t quite convince myself that it had been a good thing.

“Juniper, if there is only room for two, would you rather it be you or him that comes with me?” she asked.

“My lady,” Poul began.

“Silence,” said Amaryllis.

I swallowed. I didn’t actually think that she would kill him in cold blood, but I was still hesitant. “I would go with you,” I said.

Thunk.

Poul collapsed to the floor and blood began pouring out from the top of his head.

“What the fuck?” I asked. “You can’t just - you can’t just do that!”

Amaryllis ignored me. She stood up from behind her makeshift barricade and calmly walked over to Poul’s corpse, then kicked him over with her foot, lowered her rifle, and fired into his chest.

“The jar, please,” she said.

I was staring at her, and not just for the usual reason. I hadn’t thought that she was going to kill him, and I hadn’t wanted him dead, not even after I had learned he was a rapist, not even after he’d tried to throw me under the bus. I made no move to hand the jar to her.

“We could have let him go,” I said.

“Yes,” Amaryllis replied. “We could have let him go, but he was willing to betray you, which means that he would have been willing to betray me. I wasn’t going to take the chance that he was stupid enough to approach the Fuchsia Coterie with information about me, what resources I had, where I
had been hiding, where I might be going … and who I was with.”

There was nothing that I could say in response to that. I kept trying to think of some other option that she hadn’t seen, some other way, but all I really had to offer was optimism that I didn’t actually feel. I handed the jar over to her and watched as she extracted Poul’s soul.

“So now he’s going to have his soul destroyed,” I said slowly.

Amaryllis paused and looked at me with a frown. “Do you know why I trust you?” she asked.

I thought about my character sheet, and what it had to say about her. Loyalty 0. “Do you trust me?” I asked.

“Trust is a complex thing,” she said. “I do trust you though, at least to an extent, and hope that you continue to trust me too.” She let Poul’s soul fall into the jar with the others. (Quest Complete: Seven Bells for Seven Hells!) There were some differences, but they were nearly indistinguishable from one another. “You wouldn’t have done as I asked and returned here if you didn’t trust me. On some level you had considered the worst case option, where I killed you as soon as you came through the door.”

I hadn’t thought of that at all.

“The reason that I trust you is because you revealed that you were dream-skewered,” she said. “There are many stories that a covert agent might give, but it would never occur to the intelligence operations of the various kingdoms to present as so incredibly out of depth and without power. More to the point, there are perhaps a dozen covert agents in the entire world who could successfully fake both a profound ignorance of the world and a deep steeping in the history and culture of Earth.”

“I’m not sure what you’re getting at,” I said. My mind had drifted slightly while she talked as my eyes focused on the flawless curve of her collarbone.

“I know more of the dream-skewered than most,” said Amaryllis. “There was a time I took an interest in cosmology, and Earth was always one of the lingering questions in that field. That bit of ignorance you just displayed … that’s a trademark of Earth, a nearly sure proof of origin.” She held up the jar of souls. “You think that destruction of a soul is a bad thing.”

“It’s not?” I asked.

“Where do you believe people go when they die?” she asked me as she moved over to the soulcycle.

“I … I don’t,” I said. “I was never --” I thought for a minute about the cultural gap that might exist between us and how to say what I wanted without making assumptions on her knowledge. The misstep with saying last rites for Sly had left me a bit skittish … and Amaryllis’ description of Earth had been more along the lines of how continents and oceans it had. “There are things on Earth called religions,” I began.

“We have them too,” said Amaryllis. “Organizations built around the gods?”

“Do literal gods exist on Aerb?” I asked. “Literal in the sense of … there’s incontrovertible evidence of their actual presence, not just natural phenomena attributed to them?” I was tensed up; my personal conception of gods was that they were basically Lovecraftian in nature, elder beings of incredible power and inscrutable goals, and yes, that interpretation of gods extended to most major world religions. That view had been reflected in the worlds I’d created for D&D. If I was in a world where a Cthulhu knock-off was real …
“There are five gods,” said Amaryllis. She unscrewed a bit of thick glass from the tank of the soulcycle and poured the seven souls into it. They sat at the bottom, floating over each other. I couldn’t help but notice that the soulcycle’s tank was only a tenth full, and if the glass barrels I had seen around town were any indication … well, that meant a truly staggering number of souls. A bit of tension released from Amaryllis’ shoulders as she screwed the cap back on. “I’ve met three of them in the flesh.”

“Okay,” I said, when she didn’t continue. “Well, on Earth there’s no evidence that any gods exist, and I’m one of the people who thinks that they don’t. And as part of that, I don’t think that anything happens to people when they die, they just … cease to exist.” I could feel a tightness in my throat as I thought of Arthur and pushed forward before my emotions could get the better of me. “But we don’t have immortal souls on Earth, at least not that anyone can identify.”

“Hmmm,” said Amaryllis. She turned her attention from the soulcycle and looked at me. I could feel my heart pounding away as our eyes locked. She had killed Poul without emotion and it seemed like an affront to morality that I would still be able to look at the perfection in the curve of her lips and feel such attraction toward her. “You know, that’s not the answer that I thought you would give. Most of the dream-skewered believe that there is an afterlife which exists as a reward and one which exists as a punishment. They look on the destruction of a soul similarly to you, because there’s this presumption that everyone is going to the good afterlife rather than the bad one.”

“And?” I asked. “You use souls as a sort of fuel or something, because no such presumption exists in your society?”

“There are nine thousand hells,” said Amaryllis. “The highest hell is slightly better than Comfort, in its current state. Our infernoscopes can penetrate only down to the five thousandth hell, but there only brief reprieves from torture and pain exist, and those reprieves are marked by fear and anguish.”

It took me a bit to connect the dots from what she was saying to the question Becca had asked me. ‘What the fuck is Heaven?’ she’d asked. That was a reasonable question, if your standard cosmological model didn’t include one.

“You don’t believe in heaven,” I said. “You don’t even have a word for it.”

“We do have a word,” said Amaryllis. “We call them antihells. It’s a term you’d find in scientific papers but even then is somewhat blasphemous.” She pursed her lips. “We know what awaits us after death. Destruction of the soul is a mercy.”

She seemed to believe it. And yet … it was hard for me to believe that morality and utility were so well aligned. It would be like if the giant chugging factories of the industrial revolution made everyone healthy and wise instead of belching out noxious smoke that poisoned the lungs of a few generations. It wasn’t that I believed the world (worlds, I suppose) were zero sum, but I was instantly suspicious of how motivated the thinking might be.

“Alright,” I said instead of prolonging the conversation further. “So what’s the plan?”

“We ride,” she said simply. “Seven souls will get us up to maybe fifteen miles per hour. That will have us in Silmar City within two days, even if we stop and hole up during the night tonight. With two of us, we could trade driving duties, but it’s difficult to sleep on a soulcycle.”

**Quest Accepted: Out of the Frying Pan!**

I waited, but she had begun an examination of the soulcycle’s metal wheels.
“What’s in Silmar City?” I asked.

“It’s complicated,” she answered. She turned from her inspection and looked at me. “Do you trust me?”

“Yes,” I answered.

“Then you’re an idiot,” she replied. “Do you realize that I sent you to your death when I asked you to go retrieve those souls? It’s a profound miracle that you returned with them. I knew that when I sent you out but I coated my words in hope and honey. You have no reason to trust me.”

“I told you before, I see words and numbers in my head,” I replied. “Your name is there. You’re listed as my companion.”

“Ah,” said Amaryllis.

“I have proof,” I replied. “When I close my eyes I can see more information. Some of that I can change. When I do, there are actual results in the real world. Watch me closely.” I closed my eyes and waited the three seconds to look at my character sheet, the first time I had done so in some time.

I was sorely tempted to put the two points into MEN or SOC, mostly for the purposes of preventing any abilities from going to zero, but I had already committed to PHY when I told Amaryllis that she would see a change. When I opened my eyes, she was staring at me.

“What - what kind of ... “ she stammered. “I … I’ve seen that trick before.” I raised an eyebrow. “I don’t think I can explain it to you, how impossible that should have been. If it had been less than instant I would have had to believe that you were a skilled magi of blood or bone, but I was watching closely and you changed without so much as an eyeblink between one form and another. A minor change, but ...” she shook her head.

“Where did you see the trick before?” I asked.

“Invreizen,” she said. When she saw my blank look she added, “God of Sea and Ice.”

**Quest Accepted: God Botherer!**

I didn’t really know how to respond to that. The simple, obvious conclusion to draw from that was that I was a god, but that seemed almost certain to be wrong. Could gods be dream-skewered? But that would presuppose that my entire life on Earth was a lie, which wasn’t a bullet that I was willing to bite, and it didn’t explain the form that the game system had taken. Or perhaps I was drawing on godly power in some way without being a god, or the gods and I were drawing from similar sources.
of power. Or maybe the only similarity was in what they looked like.

“We need to get moving,” Amaryllis said suddenly. “We’re not safe here and we need ample daylight left when we start looking for a place to spend the night. I’m not sure that it would be safe to drive at night anyway, since the roads in the Risen Lands haven’t been maintained.”

“There are a lot of things outside that want us dead,” I said.

“I’ll go gather the mines,” she said. “We might have to fight our way out of Comfort.”

**Quest Accepted: Comfort Zone!**

I had so many more questions for her, but I also thought she was right about needing to leave. The image of Becca being bisected was one that I wasn’t sure I’d be able to forget, as much as I might try. As I looked at Poul’s body, I got a grim reminder that Amaryllis herself wasn’t exactly who I had hoped she would be. She had shown me compassion when we’d first met, then sent me out to what she had thought was my death anyway. It might have been easier to deal with her if she hadn’t been the picture of physical perfection.

While Amaryllis was pulling things down from the ceiling tiles in the hallway, I began looking for a coin to put in his mouth. This time, I’d figure out more appropriate last rites.

Amaryllis had mined the hallway with small purple crystals like the one that exploded in the shire-reeve’s office. They all had wires attached to them, which led into the garage and to an assembly I hadn’t noticed on the other side of car doors she’d been using for cover. At a guess, all she had to do was press her foot down and anything in the hallway would have been utterly destroyed.

She saw me with Poul, but she didn’t say anything about it. I tried my best to compose some sort of prayer, but nothing really seemed true, necessary, and kind.

“These are void bombs,” said Amaryllis, carefully holding one in her open palm. The others were covered in a piece of soft leather. “They are extremely dangerous.”

“Oh, that must be why someone threw one at me,” I said.

**Skill increased: Comedy lvl 1!**

“Then you know how dangerous it is?” she asked. I don’t know if she didn’t get the joke, or just didn’t think it was funny. Based on past experiences, the latter was a better bet.

“Yes,” I said, thinking about the skin and flesh that had been missing from my shoulder.

“They’re disconnected now, but I have the switches for them ready to go, it won’t take longer than five minutes,” she said. “The void will penetrate in all directions, so you’re going to have to make sure that there’s something between us and the detonation. It’ll go through about six inches of flesh and bone, half an inch of steel, or five hundred feet of air. Got it?”

I nodded. It sounded like I was more or less right about it being based on density. When she put on the switches and handed one to me, I got a small surprise.

**Skill unlocked: Thrown weapons!**

It didn’t bode well that I was going to be handling these things with a zero in that skill, but so far I hadn’t actually done too badly. My very first time swinging a one-handed weapon had been a critical
hit that had split the zombie’s face in two, not that it had much effect on the outcome. I handed it back and she slipped it into a piece of soft leather.

When Amaryllis started up the soulcycle, I wasn’t quite prepared for it. My uncle had one of those huge, thick motorcycles, the kind that get referred to as ‘hogs’, which the soulcycle more or less resembled. I was thinking that this would be similar, with a thick chugging sound that would make it hard to talk. Instead, it gave off a sound like a crack of thunder and short, finger-long arcs of lightning arced out from the wheels as the whole thing rose up from the ground. It sat there with a shimmering translucent blue aura around the wheels, a few inches off the floor.

“Ignition was louder than I had hoped it would be,” said Amaryllis. She took the void tunneler from me, slung a pack that had been sitting beside the workbench over her shoulder, and straddled the soulcycle, which lowered a fraction of an inch. “Grab the rifle, shoot anything that gets close.”

I picked up the rifle --

*Skill unlocked: Rifles!*

-- but that message wasn’t entirely welcome, because it meant that my methods of attack were both ones that I was untrained with.

(There was something that had been bothering me about the game layer for some time now; it assumed that I was starting almost completely from zero. I had been in decent enough shape, good enough not to make a total ass of myself in Phy Ed, so why had the Athletics skill unlocked when I’d started running? Similarly, I had gone hunting almost every fall since I was ten years old. The rifle that Amaryllis had built was different from those, but how did the game layer interpret me to have zero skill with rifles in general?)

I climbed on board the soulcycle just behind Amaryllis and practicing sighting down the barrel of the void rifle and very lightly testing the pressure of the trigger to see how much give it had. I hadn’t removed my sword from my hip, but Amaryllis hadn’t questioned it, and the game layer seemed to indicate that there was some use for it.

“Bombs are in the pouch,” she said. “Deal with them carefully, because one would be enough to kill us both. Ready?”

“The door’s closed,” I said, looking at the rolling garage door.

“We’re going out the other way,” said Amaryllis. She twisted the throttle and steered the soulcycle through the garage, past Poul’s body and down the hallway. I was using two hands to hold onto the rifle, which meant that I was clinging to the soulcycle with just my thighs, similar to riding a horse without hands. Even going slow it was a little bit terrifying, in part because of the arcs of electricity (or something like it) that came from the shimmering aura we were using in place of wheels. It occurred to me that even though the soulcycle was fairly quiet, the glowing wheels, arcs of lightning, and fuel tank with glowing souls in it would all make us incredibly conspicuous.

The door was partly open already; Amaryllis must have done that when she was retrieving the bombs. She slowed down only slightly, raised her pistol with one free hand, and used it to nudge the rest of the door open. A single zombie was standing twenty feet away, staring at us with its glowing red eyes. Amaryllis took aim and with a *thwip* of her gun it crumpled. Then, she put on speed.

It was fairly underwhelming. As she’d guessed, the soulcycle topped out at fifteen miles per hour, which was fast enough to beat a person sprinting after us and certainly meant we could out-pace the Voltrons. It was still slower than I could pedal a bike though, and in comparison to a car it was...
practically sedate.

We’d made it all of half a block when the window of a car shattered next to us. Amaryllis was turning the soulcycle before the sound of the gunshot even reached us. I gripped the soulcycle between my legs, trying hard not to get bucked.

“Fuck,” said Amaryllis. She steered us down one of the streets that branched off from the main thoroughfare and put a building between us and our shooter just as the sound of another shot came rolling across the fields. “Ballistics,” she called back to me. “Their effective range is three times ours, maybe more.” She kept the soulcycle going, turning abruptly in an unpleasant way to take a different street. “If we drive toward them, we’re fucked. Ideas?”

“Punch through Comfort,” I said.

“If they have ballistics there?” she asked.

That was a very good question, to which I had no good answer. “We have to try,” I replied.

I felt a little bit sick when she nodded to that, because I knew it wasn’t a very good plan but the fact that she was concuring meant she agreed it was our best bet. So far as I saw it, the only other option we had was to hole up and hope that we could scavenge enough not to die while also successfully hiding out from both zombies and sweeps. Hit-and-run guerilla tactics might work in our favor, but all we needed was to get unlucky once. The only reason I was still alive was that leveling up had put me back in perfect health twice after serious injuries.

When we turned down the next street, we saw three members of the Fuchsia Coterie standing on the roof of a two story building with one of them firing down on one of the zombie conglomerates, which was putting its forelimbs against the building and trying to swat at them. The rhythmic thwip sound was now audible over the sound of the soulcycle. The Coterie saw us immediately and two men with pink hair and long rifles raised them to fire at us. I lifted my own void rifle up and aimed at them just as they were aiming at me.

(We weren’t all that far away from each other, but I was moving, not in control of my movement, trying to keep my balance by squeezing my legs around the seat, and using a makeshift weapon that I had never fired before, which operated on technology that was beyond my understanding. I knew even before I took the shot that I was basically shooting for the sake of covering fire, hoping that they would see me take aim and move out of the way, thereby reducing the window they had to fire on us.)

Thunk.

**Critical hit!**

**Skill increased: Rifles lvl 1!**

**Fuchsia Coterie sniper defeated!**

I blinked in surprise as one of the riflemen tipped forward and fell over the edge of the roof, landing awkwardly on the conjoined zombies, which grabbed at him with the arms that jutted out from their collective body. When I looked up, both of the others were gone from view, most likely hiding from what they must have thought was hideously good aim.

(“I’ve always thought it was dumb,” said Reimer. “You roll a 20 and you get an automatic hit? So a level 1 commoner with cerebral palsy goes up against the greatest warrior of all time, a man in
magical full-plate with a frickin’ tower shield with little mini tower shields floating around it, and there’s a 5% chance that he’ll hit? How is that not dumb?”

“It’s not about simulation,” Arthur replied. “You’re not supposed to think that the whole world is made up of people with levels who are acting in accordance with these abstract rules, that’s what’s -- I don’t want to say dumb, because I can see where that might appeal to people, but that’s not what these games are usually about. They’re about telling this small, improvised story that no one but a handful of people are ever going to hear. Having a rule like an automatic hit on a natural 20 is just in service of story-telling.” He turned to me. “Joon, tell us that story.”

“Which story?” I asked. “The one about the level 1 commoner and the best warrior in the world?”

Arthur nodded. He was putting me on the spot and we both knew it, but that was part of how things were between us. Arthur considered it part of the implicit contract between player and DM.

“Alright,” I said. “The commoner’s name is Moxit, he’s got cerebral palsy, and he’s depended on the kindness of strangers pretty much his whole life. He hates it, but there’s not really any other option for him. Eventually Kerland, the big bad warrior comes to town. He knows that he’s basically invincible to these people, which is why he likes these out-of-the-way places where there’s not even a hedge druid to send a messenger bird for aid. Now, the villagers know that Kerland is unstoppable, so they’re ready to submit right away, giving Kerland roasted chickens, loaves of bread, spare coin … and if he pushes, one of the village’s daughters might volunteer to keep his bed warm. And when Moxit sees this, he’s enraged. All these people he’s known all his life are acting helpless. Moxit spends his days struggling, trying to do what he can, trying not to be this burden. And now, now all these villagers are just giving up. So when Kerland is in the village center, Moxit steps out of a building with his bow at the ready. Kerland sees him and goes into a defensive stance, because while he’s incredibly powerful, he’s not so stupid as to give someone a free hit for no reason. Moxit looses his arrow,” and here I rolled a die behind my screen, a 15, which I quickly flipped to a 20 before holding it up to show the group. “His arrow releases at the perfect time and though at first it looks like it won’t, it eventually curves to just the right angle, going just over the tower shield in front of Kerland, passing right by the small floating shields of Romoc, and striking at one of the few weak points in the armor, a place between the plates where it’s soft leather. The arrow doesn’t kill Kerland, not even close, but it does graze him, and in that moment Kerland feels a real fear, because now they know that underneath a small kingdom’s worth of magic items and a body that would make the God of Might green with envy, Kerland is still just a man.”

“Hax,” said Reimer. “And the commoner could have just as easily rolled a 1. And the epic level fighter goes and straight up murders him with a single swing of his sword, and cleaves into someone standing next to the commoner just to make a point.”

“In which case it would be a different story,” said Arthur, “One about the futility of fighting, or about ego, or something like that. There are so many paths, the dice roll just shifts you from one path to another, from one story to another.”

And then the pizza came, and the argument was more or less forgotten.)

My eyes tracked back down from the roof of the building to Zombie Voltron, which had integrated the corpse of the sniper I had shot down. It turned to look at us with its bright red eyes and after a moment where something like a thought must have passed through something like a brain, it dropped its forelimbs from the building and began bounding toward us.

“Bombs,” said Amaryllis. Her voice was steady, as steady as it had been right before she put a hole through Poul’s head. I slung the rifle over my shoulder and grabbed reached into the pouch, grabbing two of the small leather balls that each contained a bomb. “Turning,” said Amaryllis, and I had to use my free hand to hold onto her hip in order to keep myself from slipping. “Throw when I say.”
The Zombie Voltron came around the corner after us. It was slower than us, but we had zombies and cars to navigate around, while Zombie Voltron just barreled past, barely slowed down. My heart was in my throat and fresh fear washed over me every time the soulcycle slowed down to maneuver.

“Now, behind that car!” shouted Amaryllis.

I hit the switch and threw the bomb, hitting the side of a car just as we passed it and gaining a skill level in the process. I grabbed onto Amaryllis again as I turned back to watch, one bomb still held firmly in my grip. The zombie-thing reached the car and for a moment I thought the timer would be too long, but I heard the subdued detonation and saw layers of flesh instantly exposed on the corpses near the back. Some of them tumbled down to the ground, but it didn’t stop the creature itself.

“Get it?” asked Amaryllis. I turned back to face the front just as we came within a hand’s breadth of a zombie’s lunge.

“No,” I said. “Another?”

Amaryllis released one handlebar and lifted up her pistol, quickly firing it at a man I didn’t see until he was already stumbling to the ground and clutching his leg. “We need cover,” she called. “Wait for it.”

The town of Comfort was not particularly long, and we were rapidly reaching the end of it. I was worried about what would happen when we got out onto the open road; the rifles I was familiar with could shoot several football fields and it didn’t seem like that was too different here. Moving targets were harder to hit, especially if they were making an effort to move erratically … but I had landed a nearly impossible shot not a minute prior and I was scared to death that it cut both ways.

As it turned out, I should have been more worried about what was happening behind me. A second Voltron had joined the first, and both of them were chasing us. The obstacles we faced had started to thin out, but there was something in the red light of their eyes that was making me queasy. I felt a sigh of relief when they suddenly stopped, but then the two beast-shaped corpse piles began touching each other, frantically merging by sliding their component bodies over one another. In my mind’s eye I imagined a creature as large as a two story house rushing towards us, but what happened instead was that the mass of bodies parted to reveal something smaller than either of them had been.

If they had looked like they’d been molded from someone mashing bodies together, this new thing instead looked like the product of careful deliberation, as though someone had picked out the ten most intact bodies and put them together like they were working from factory instructions. At the front there were three human heads all facing toward us, their bodies trailing behind them to make up parts of the thing’s legs and torso. All glowed red as it looked around and tested its step. Then it began running.

“It’s faster than us,” I called out to Amaryllis. I set the bomb down, wedging it between us, and aimed the rifle behind me, awkwardly twisting in my seat while trying not to fall off. It was hard to tell whether my first shot hit, but the Death Hound didn’t stop or even slow. Kill the hearts. That was a simple plan with difficult execution, especially since the void rifle couldn’t penetrate through more than six inches of flesh.

“What’s faster?” asked Amaryllis. Her gun was out again and she was taking shots at something or someone I couldn’t immediately see.

“Find cover,” I said. “Gotta throw another bomb.”

She fired her pistol again. We were out of the town now, with only a few sparse buildings left on the
long road ahead. “Car ahead,” she said. I was whipping my head back and forth, trying to judge time and distance. The Death Hound was too close to us, if I made the same throw I’d made before it would pass by the grenade uninjured.

I hit the switch on the bomb and threw it forward, ahead of us. I saw it roll and hit the car wheel and would have counted down if I thought these makeshift weapons had precise timing. I watched the void bomb on our entire brief approach, willing it not to kill us. At the last second I turned back to see the Death Hound and began to unsling my rifle again. We passed the car and I heard the muted detonation at the same moment, the events so close together that I almost thought that we were going to be caught in the blast. Instead, the Death Hound fell apart with arms, legs, and heads tumbling out onto the road.

*Greater Umbral Zombie defeated!*  
*Quest Complete: Comfort Zone!*  
*Level up!*

You might have thought that the golden light was familiar to me now, but it still managed to catch me by surprise, and the wave of ecstasy was no less sweet for having experienced it before. I lifted out of my seat, only slightly, and came back down without losing my balance. Amaryllis must have felt what was happening to me, because she turned the soulcycle then overcorrected the other way, leaving us briefly wobbling as she regained control.

“You,” said Amaryllis after some time. “We’re going to figure out what you are.”
Amaryllis spotted a house beside a barn when we were two hours out from Comfort and we turned down a dusty, bumpy road overgrown with weeds to get there. We did a sweep for zombies, killing the two we found, then hid the soulcycle away and began trying to find something to eat. The kitchen was filled with long-since rotted food that I was almost hungry enough to attempt eating. On top of that there were cabinets with broken doors and upturned cans, clear signs of looting.

Eventually I went into the yard and looked around in the undergrowth. It hadn’t taken me terribly long to find where a garden once stood, and that was where I found our supper of raspberries, tomatoes, and onions.

**Skill unlocked: Horticulture!**

Before anything else, Amaryllis insisted that I tell her about the magic I possessed and the delusions I was under. We sat together in the porch as the sun set, until eventually the only light was moonlight filtered through a still-overcast sky. I described things in brief, until eventually I found myself having to tell her about tabletop roleplaying games.

“My friend used to describe it as basically a play.” I said. I didn’t really say Arthur’s name much anymore, mostly because it brought a lump to my throat. “Except it’s a play without a script and instead of just making things up as you go along you have numbers and dice as a guide.”

Amaryllis nodded. “There is a form of public performance similar to that in Five Spires,” she said.

*Five Spires exists,* I thought to myself, filing that away for later. I had seen one of the White Spires on a calendar back in Comfort, so that wasn’t a particular surprise. “Do they use dice?” I asked. One of Greg’s favorite jokes was his character breaking out a pencil and paper and whittling dice to play a game-within-a-game. I’d humored him sometimes, when I thought the joke was funny. I had no idea if that kind of thing would end up here.

Amaryllis shook her head. “The action stops at various points within the play so that one of the characters can come forward and ask the audience for advice on some crucial decision. When the audience has made their choice clear, usually by yelling, the action resumes. All possible decisions are written ahead of time, with the traditional form having thirty-two possible outcomes. It’s low art. These games are similar?”

“No,” I said. “That sounds more like Twitch plays Shakespeare.”

She gave me a blank look. “Explain.”

“Uh,” I replied. “Nevermind. We’d be here all night.” I paused. “Do you have computers in Aerb?” (I hadn’t seen any in the shire-reeve’s or any of the shops that we’d been in, but I wasn’t sure that meant anything. The Risen Lands were in an exclusion zone, and making assumptions about the rest of the world based on what I saw here would be like an alien landing in Chernobyl and trying to infer what humanity was like from what it saw.)

“Yes, we have computers,” said Amaryllis.

“Okay, well the other thing I need to tell you is that while there are games that are played with paper, pencils, and dice, later on a bunch of those games transferred to computers, first by just adapting in the rules as well as they could, and after some time doing that they became their own thing. I mention
that because I think that’s the sort of thing that the words and numbers in my head are mimicking. There’s, uh, a lot to talk about there.”

She gave me another blank look. “I don’t understand how a computer helps,” she said. “You said that there was math involved with these character sheets, but I was under the impression that it was all done by hand.”

“Right,” I said, not sure where the disconnect was happening. “So instead, the computer handles all that. Wait, are computers expensive here? On Earth they cost … a week’s wages, if you’re doing menial work.” That was roughly what my netbook had set me back.

“For how long?” asked Amaryllis.

“How long?” I asked.

“If you spend a week’s wages, how long do you have the computer’s labor for?” she asked.

“As long as they last, but most people trade in after two or three years,” I replied. I could feel the disconnect growing, but couldn’t imagine where it was. If they only had large-scale mainframes here her confusion would make more sense. “Low cost means that there are a lot of them.”

Amaryllis sighed. “When I say computer, I mean a woman trained for at least three years at the Athenaeum of Mathematics and Metaphysics, usually hired for the purposes of complex mathematical calculations relating to cryptography, physics, or the more esoteric magics. What is it that you mean?”

“Oh,” I said. “That’s actually what the word used to mean on Earth. Not with the athenaeum or magics, but ‘a person who computes’.” I had used that as a plot for a short adventure in a steampunk campaign. “We have electronic computers.” Amaryllis raised an eyebrow. “The numbers are more complex than in tabletop, because if you swing a sword with a certain amount of force, at a certain angle, then you can calculate whether it hits a different sword that’s moving at a different angle and speed, and the computer will just do all that without you having to think about it and tell you whether or not you parried.”

“I don’t think this is helping us,” said Amaryllis. “There have been a thousand dream-skewered, all of them interviewed and tested many times over at the Athenaeum of Speculation and Scrutiny. The details of these mechanical computers are interesting in an academic sense but don’t remotely explain the physical effects of your personal magic, nor the governing logic of it. There are so many questions that I’m starting to find it frustrating.”

“You think it’s frustrating?” I asked. “At least you have some knowledge of Earth and some context for my condition, even if I think you’re probably wrong. There’s this entire world of Aerb that I know nothing about, and half of it seems to be tied to things that are already in my head. And, I like talking about roleplaying games, partly because it lets me not think about the people I killed today, but you haven’t been very forthcoming with information.” As soon as the words were out I felt like I had gone too far. I’d snapped at people from time to time back on Earth; it was practically a daily occurrence in the weeks after Arthur had died. I was worried that she would turn away and say something like ‘we should get some rest’, but she only looked at me for a moment.

“We both want information,” she said. “Question for question, no more than a few minutes per answer, and follow-up questions can be taken as your next turn. The Athenaeums recommend structure. You can go first.”

I took some time to think.
Things to Ask Cypress Amaryllis

1. How do I learn spells?
2. What powers do gods have?
3. What happened to the Risen Lands?
4. Why were you on that plane?
5. What are you the princess of?
6. How large is Aerb in comparison to Earth?
7. How quickly is technology progressing, if at all?
8. What do the dream-skewered say about Earth?
9. Does Fel Seed exist?
10. Do the mimsies exist?
11. Is there a city called Nightsmoke?
12. Why don’t people say the z-word?
13. What are void crystals and why were they banned?
14. Where do souls come from?

I probably could have kept going. Every thirty seconds a new one popped in my head. I could sort of see the point of going tit-for-tat on questions though. It wasn’t just about equality in sharing information, it was about ensuring that both people would at least try to ask each other the important things first. I knew that we couldn’t spend all our time talking, which meant it was time to prioritize. I ended up starting with something that hadn’t even made the initial list.

“What’s in Silmar City?” I asked.

“That’s too many questions,” said Amaryllis, but she gave me a small smile after she said it, so I kept my complaint on my tongue. It was the first time she’d smiled at me. “The short version is that Silmar City was the target of the attack that formed the Risen Lands, it’s awash with the walking dead, and there was once a secret facility there dedicated to the study of necrotic field effect, which I believe contains a key we can use to teleport ourselves to safety.”

I opened my mouth to ask another question before I remembered that we were taking turns. “Okay, your turn.”

Loyalty Increased: Amaryllis lvl 2!

“What skills does your character sheet say you have?” she asked.

I closed my eyes and read them off, slowing down only at the last three. “Comedy, level 1; Deception, level 4; … and Romance, level 0.”

She looked at me with a raised eyebrow. I was sure that I was blushing. (And yes, I was in mortal danger, locked off from the world I knew, I had killed people, but she was so, so pretty and maybe I was just a stupid sop for looking at her like I did, or maybe I was trying to find comfort in whatever I could). “Your turn,” she replied.

“Okay,” I said quickly, trying not to trip over my tongue. “Where do souls come from?”

“Really?” she asked. I nodded. The question wasn’t important to my personal well being, but it had been nagging at me. “Can I ask why you want to know? You can count it against me, if you’d like.”

“No, it’s fine,” I said. “By my reckoning, the tank on the soulcycle could hold about seventy souls, maybe as many as a hundred. Everywhere I’ve gone, I’ve seen empty glass tanks that look like they
probably contained souls. Even simple math seems to show that there are far, far too many souls sitting around.”

Amaryllis let out a puff of air that didn’t quite rise to being a sigh. “The soul first appears six days after conception, though we don’t believe it’s capable of going to hell until roughly one month after formation. You are correct that our desire for souls as a power source far outstrips those available from people naturally dying, so to that end we have laboratory techniques which create souls from volunteer samples. Almost all the stock you see comes from a combination of Podsnap’s Technique and Bokanovsky’s Process.”

That sounded familiar, but I couldn’t quite place it. Souls and the afterlife were one of the default assumptions in most fantasy games, so it wouldn’t have surprised me if I had thought up something like that … but the memory was unclear, and I was distracted by a sudden realization of the implications.

“You’re creating souls to damn them to the hells,” I said.

Amaryllis shifted uncomfortably. “In theory,” she began, then stopped. “The lie we tell ourselves is that the souls will be created and then used up with no conscious experience to speak of. Usually that’s true, but accidents and assaults happen. A large enough bomb detonated in a city wouldn’t just claim the lives of the people, it would consign the purpose-made souls to hell. Thousands of them, maybe millions.”

“Shit,” I said. What happens when someone gets to hell? Do they have a body? Would thousands of newborn babies just drop out of the sky? It churned my stomach enough that I decided I didn’t want to ask just now.

“Alright,” said Amaryllis. “In the games you play, what skills, aside those you’ve already ‘unlocked’ would you most expect to see?” she asked.

“Um,” I swallowed, trying to shift gears. I closed my eyes and looked at my character sheet. “One-handed weapons implies two-handed weapons, parrying and dodging imply blocking with a shield, pistols and rifles mean maybe automatic rifles or shotguns, horticulture is new but that makes me think along the lines of crafting or gathering skills like smithing or mining, and of the social skills … persuasion is notably absent, and I think I would have gotten that by now, but that does leave intimidation. And depending on how magic works, I’d think I’d have at least one magic skill.”

“Try to intimidate me,” said Amaryllis. She leaned back and waited with an expectant look on her face.

“Um,” I said. I raised my fist. “You, you had better … had better not sleep during your guard shift tonight. Or else.”

Skill unlocked: Intimidation!

Critical failure!

I had hoped that Amaryllis would laugh, or at least give me another smile, even if it was a small one, but instead she just raised an eyebrow. “Did that work?” she asked. “You took your focus off me for a moment.”

“Yes, it worked,” I said. “Thanks. I critically failed.”

“Yes, I saw,” said Amaryllis. She didn’t smile, she smirked, but it was close enough that I started
“Is it your turn or mine?” I asked.

“Yours,” she said calmly. I had this certainty that she could read me like a book.

I tried to think back to my list, but I was tempered by her last answer. I was going to have to sleep in this creepy house. “What are you the princess of?” I asked.

“What are you the princess of?” asked Amaryllis. “Nothing.” She saw my frown and tucked hair behind her ear. “I was part of the Lost King’s——” she stopped and shook her head. “Can I tell you a story, as a prelude?”

“Sure,” I replied. I had just noticed myself getting tired and was willing to end our mutual questions in favor of sleep. A story that gave me a reprieve from the intensity of thought the question game required sounded nice.

“There was once was a great and powerful king,” said Amaryllis. Her voice was different, in telling it, and I had the feeling that this was a proper Story, not just a recounting of things that happened. “He was everything a person could want a king to be, kind and just, noble and pure, charming and avuncular, like he was a loving father to the entire kingdom. He had two sons, one a warrior, always on the battlefield, and the other a scholar and administrator. Each of the princes was skilled in his own way, each loved equally by their father.

“One day, the king went on a great and dangerous quest. He never returned.”

Quest accepted: The Lost King, Found?

I immediately began paying the full amount of attention as Amaryllis continued.

“The administrator had been put in charge of the kingdom while their father was away, but it was his brother, the warrior, who was the eldest and therefore the rightful heir. As weeks turned into months, the warrior began to push for the administrator to declare their father dead. The administrator refused, because their father was so wise and powerful that he would never have gone on a quest of such importance and then simply failed. The brothers argued at length as the months turned into years. It was a time of peace, one forged by the king, which meant that the warrior was mostly concerned with petty threats and the appearance of strength. It was the administrator who had all the actual powers of rule, in the king’s protracted absence.

“Eventually matters came to a head. The two brothers fought one another … I’m actually going to skip this part, because the way it usually goes it takes ages to get through, but it would suffice to say that the administrator bested the warrior three times and the matter was laid to rest. To avoid a civil war and ensure that the matter was truly settled, they jointly declared that their father, that wise and glorious king, would not give up his crown until either he returned or his body was recovered.”

Amaryllis let out a breath. “That was five hundred years ago. Every heir of either brother since then has been styled as Prince or Princess, and there are hundreds of us in almost every important governmental role, so don’t think that I actually stand to inherit a proper title of Queen one day. I’ve seen more than one foreigner make that mistake.” She held out a hand. “Amaryllis Penndraig, tenth of her name, Special Liaison on Existential Emergencies for the Kingdom of Anglecynn, long may it stand.”
I shook her hand weakly. My blood had run cold. “The Lost King,” I said slowly. “What was his name?”

She looked at me like she thought I was about to faint. “Uther Penndraig,” she said slowly.

“Oh,” I whispered. I recognized the name, only this time it wasn’t one of mine.

“Tom, character name?” I asked.

“Elhart Cloakshield,” he replied in his most pompous voice, the one he reserved for elves and wanna-be elves. “Signature move: twirling his cloak and using it like a shield.”

“So he decided that he couldn’t let a name like Cloakshield go to waste?” I asked.

“There is literally nothing in the rules that allows that to work,” said Reimer.

“Maybe Cloakshield is a family name?” asked Arthur. “The Smith family name comes from generations of blacksmiths, it’s not totally insane to think that they’d get a name that identified their most defining combat ability.”

“An ability which, again, the rules do not provide for,” said Reimer.

“Eh, we can do it as a weak custom magic item,” I replied. “I’ll figure it out later. Arthur, character name?”

“Uther Penndraig,” he said with a smile. “Mechanically he’s a pretty standard sword-and-board fighter, but I’ll be taking some paladin levels later on, just to warn you.”

I jotted that down in my notebook. The start of a campaign always saw my notebooks more organized and the first session started with a page neatly divided up so I would have places to write down details of all the player characters. It would only be later that it would descend into scribbles of names and places I never remembered a few days later.

“Arthur Pendragon?” asked Reimer. “I thought we weren’t doing copycat names.”

“I said you couldn’t be a warforged named Megatron,” I replied with a roll of my eyes.

“He’s the leader of the Decepticons!” said Reimer.

“Technically I picked *Uther*, who is Arthur’s canonical father,” said Arthur. “And I picked the Middle English version of Penndraig so it would be less immersion breaking. But yeah, I always wanted to have a character that was something of a King Arthur ripoff. Not that I think I *am* King Arthur or anything, but I grew up with the name and I’ve always thought there was a connection to famous people you share a name with, like if your name were Alexander you might have an interest in Alexander the Great, or if your name were Benjamin you might think about Benjamin Franklin.”

“Didn’t he have syphilis?” asked Tom. “Also, why are there no famous people named Tom?”

“Tom Hanks?” asked Reimer.

“Historical Toms, I mean,” said Tom.

“Thomas Aquinas,” I said, holding up a finger. “Thomas Jefferson, Thomas Edison,” I continued. We went around the room like that for a while, until eventually Craig went to Google and began
listing off every single Tom of note since the New Testament. Arthur leaned over to me while that list was being read off.

“T can change the name,” he said.

“No, it’s fine, I get it,” I replied. “I mean, obviously you can’t start as the King of England, but I’ll see what I can do about a watery tart throwing a sword.”

And that was more or less how Arthur had started down the road to becoming the Best King Ever.

And now Uther Penndraig was here, in this world, as a part of this game or whatever it was. I shouldn’t have been so surprised by that; every world I had ever made had players stomping around in it, why shouldn’t those characters be there too? But I’d always felt like players were intrusions in the worlds, not fully acquainted with what I had made, and I was always bending to them, even to Arthur, if only a little bit. A fresh wave of fear came over me as I thought about some of Reimer’s characters being here.

And that quest, “The Lost King, Found?” If Uther Penndraig was a real person in this place … he wouldn’t be Arthur, I couldn’t start imagining that, and he had been missing for five hundred years, but the game wouldn’t give me a quest that I couldn’t complete, would it? I started getting dizzy with hope just thinking about it. Even if Uther wasn’t Arthur, it was a creation of his, a character that had started as a ripoff and become its own personality.

“Do you want first shift or second shift?” asked Amaryllis. “We’ll sleep here tonight, since I don’t see any red eyes on the horizon. We might have to get up in the middle of the night to clear them out before they can clump up.” It took me a moment to realize that she’d let the questions and answers die out without even mentioning it.

“Second shift,” I said. “If that’s okay with you.”

The air had gotten chilly and we hadn’t found any usable bedding in the house. I wondered whether I would even be able to get to sleep given all that had happened that day. I tried to make myself comfortable on the hard floor with, Amaryllis sitting next to me and keeping watch, but it was cold and awkward. I spent some time looking up at the ceiling of this abandoned place, then turned over and looked at a wall instead.

This went on for about half an hour until Amaryllis reached down, placed a thumb to my forehead, and said a word that seemed to slip off my mind like a runny egg. I was out like a light before I could even think the word magic.
I woke up to Amaryllis whispering. She was kneeling beside me and touching my face. I had a moment of confusion at seeing her until the world came back into focus and I realized where I was.

**Achievement Unlocked: Under the Moon of the First Night**

“It’s your turn to keep watch,” she was whispering. “Are you awake? Are you with me?”

“Yes,” I replied. I got to my feet and looked around, blinking. The sky was no longer obscured by clouds, which made things a lot brighter than when I had gone to sleep. Multi-colored stars had been revealed, with all the colors from across the spectrum of visible light, pinks, greens, blues, and oranges that were astrophysically impossible. There were no constellations I recognized, but there was something like the Milky Way, a thick region of stars so dense their individual colors were hard to make out; it looked like a gash upon the sky. And the moon … the moon had no blemishes on it, no familiar craters, but it was laced through with geometric lines that all seemed to terminate in a point of pinkish light where the Sea of Tranquility would have been.

“Celestar,” I breathed. Once the home of the elves, before they’d been forced to flee. *This world has elves.*

“Residual knowledge?” asked Amaryllis.

I wanted to say that it wasn’t, to protest that Celestar had been my idea, this permanent monument to what the elves had lost, stark and clear for everyone to see, every single night … but instead, I said, “Probably,” then, “Get some sleep.”

“Wake me at first dawn,” she said, “My watch was clear, I hope you can say the same.” She laid down where I had been and folded her arms across her chest, then lay still. I looked her over, then turned away because I felt like a creep.

At best guess, I had four hours to spend on watch. The porch we’d taken up residence in had a full view of the fields. We weren’t as defensible as I would have liked, but there had been no red lights of zombie eyes visible for miles around and the Coterie, if they were in pursuit, would know our direction as we left Comfort but almost nothing else about where we were going or might possibly stop.

Keeping watch was dreadfully boring. Most games, both tabletop and computer, would just skip through the watch and tell you if something interesting happened. Games weren’t meant to simulate tedium, which was more or less what keeping watch was. After what felt like thirty minutes but was probably more like ten, I started getting antsy.

It took three seconds to bring my character sheet up. I had two more points to spend from having leveled up. I was very conscious of having my eyes closed, a situation which was not amenable to keeping a lookout. I resolved to drop back out of the menu at a regular interval and then looked over the stats. My modus operandi had become to simply pour points into PHY, which increased POW, SPD, and END. I could feel the changes from it already in the way that I moved. I was more muscular than I had been in fifth period English class, enough that people back home probably would have asked me if I had been working out, but I didn’t think that I’d place at the top of my class in terms power, speed, or endurance, at least not yet.

The problem was, I didn’t know what the game’s power curve looked like with regards to the
numbers it showed me. If they were sublinear (that is, produced less of an effect per point invested) then I was almost certainly better off spreading points around as soon as I could spare them. If they were linear (that is, produced an equal effect per point) then I was still better off spreading them around because of the diminishing marginal utility of each point (e.g. the difference between being able to jump 10 ft. and 12 ft. was a lot greater than the difference between being able to jump 200 ft. and 202 ft.). If the points were exponential … well, then I had probably already blown it, because if I’d spent it all on SPD I could have had it up to 10 by now.

The problem was, the stats weren’t exposed.

Nothing happened. But then, I had never used voice commands for any of the game stuff. The tooltips appeared when I looked at things long enough, I’d swiped from one page to the other using eye movements, and I’d spent ability points by looking at the little plus signs. Nothing had indicated to me that vocalizing what I wanted was a path to success.

I opened my eyes and looked out at the fields, scanning for movement and light as was my dreadfully dull duty. I kept this up for a minute or so, then retreated back into my character sheet.

Everything game interaction had been done using my eyes in some way. How would I signal that I needed some kind of main menu then? What was the eye control equivalent of pressing Escape on the keyboard or Ctrl+Alt+Del? It would have to be something that I wouldn’t just do by accident, but that I could still do fairly easily. I still wasn’t counting on basic principles of design being followed, but ideally it should be something that held meaning, because obviously I couldn’t refer to a shortcut cheat sheet.

I tried lots of things, until my eyes were starting to hurt from whipping them around. Why couldn’t the game have done something like putting a discreet box in the upper lefthand corner? Eventually I decided that the answer was probably about encoding. The game recognized blinks, which I’d been using to clear messages, it recognized left and right swipes, and though they didn’t actually seem to do anything, the pages at least gave some movement when I tried going up and down. If I were going to encode something … well, if I were going to encode something, and it was just for me, not a generalized system for other people …

Up, Up, Down, Down, Left, Right, Left, Right …

And I didn’t have to think about how I was going to complete the rest, because the settings screen popped up in front of me with three vertical columns of options.

<table>
<thead>
<tr>
<th>Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ironman Mode</td>
</tr>
<tr>
<td>Hardcore Ironman Mode</td>
</tr>
<tr>
<td>Diamond Hardcore Ironman Mode</td>
</tr>
<tr>
<td>Helldiver</td>
</tr>
<tr>
<td>Dead-man's Switch</td>
</tr>
</tbody>
</table>

I read through it cautiously, careful not to hover over any checkbox for too long, lest I accidentally change something. Then I swore silently, under my breath, careful not to wake Amaryllis. The tooltips had given me bad news. On the one hand, I had already been acting under the assumption that death would be bad (duh), but to see “you will die for real” spelled out so clearly and unambiguously, and to see a checkbox I couldn’t uncheck taunting me was still like a slap in the
face. Similarly, “Verisimilitude Mode” was locked down, and it cut off a number of features that I would have found exceptionally useful. I hadn’t had “Fast Travel”, but now I knew I never would, because I was stuck in Verisim Mode.

“Helldiver” confirmed the existence of the hells, but it led down a philosophical rabbit hole. Was it better to die or to live a life of eternal suffering? I didn’t know that I could properly answer that. Amaryllis had said that the highest level of hell wasn’t much worse than Comfort, which seemed bearable, even in the long term. I decided against checking the box right that instant. Similarly, the “Dead Man’s Switch” would kill me if I was going to suffer a fate worse than death. That seemed on the surface like a similar deal with regards to death and suffering, but it left me asking the question of “Worse by whose definition?” so the checkbox was also left unchecked.

I turned “Verbose Quest Logging” on, then “Hit Points” and “Mana Points” too, on the theory that they would give me more information, and more information was good.

When I opened my eyes, there was a little red bar in the lower left corner of my vision, in a place that should have been at the very edge of my periphery but was somehow still entirely in focus. When I paid any attention at all to it, it showed two numbers with a slash between them, “27/27”, and the word “Health” appeared running vertically alongside the bar. That wasn’t terribly helpful and the tooltip said there was no mechanical impact, which didn’t make a whole lot of sense to me. Convention would have dictated that there be a blue bar on the right side for mana, but I didn’t know any magic as yet.

I looked for zombies, and there were still none.

Despite opening the settings page, there was nothing there that helped me. There was no way to expose the actual mechanics of the game, not even by enabling hit points, because the hit points were just a representation of health that seemed like it would be far inferior to what I could tell just by paying attention to my injuries. And by my reckoning, I was still at least three hours away from the end of my shift, maybe more.

However, the fact that mechanics weren’t directly exposed didn’t mean that there was no way to figure them out. The game had given no explanation that touching a weapon would unlock a skill, but I had cottoned onto that after seeing it happen two times. I checked to make sure that Amaryllis was still sleeping, then grabbed the void tunneler and stepped out in the night.

Skill increased: Pistols lvl 6!

I strolled over to the target that I had set up, a dented aluminum can with a label so faded that I could just barely make out a red splotch. It had holes in it now, perfectly round like they’d been drilled in with machine precision. My aim wasn’t great; I had missed twice and I could see one of those times had put a hole in the wooden fence I’d set the can on top of. I turned it over twice, then went back to take position a little bit further away, scanning the horizon the entire time. I wished that I had a silencer, but had no idea how to fashion even a bad one for something like this gun. It wasn’t very loud, but even with a light breeze rustling the tall grass, it was the loudest thing around.

I was faintly surprised that I was able to increase in skill by shooting at a can. Logically, people got better at combat-related things mostly by intensively training outside of combat. Professional MMA fighters had something like four ten-minute fights a year, which were interspersed with months of intensive training. Fighting in the real world had value, sure, but it was the months of training that mattered most. But that was boring, so games always found ways to minimize that truth, because a game that gives players an incentive to do really boring things is a poorly designed game. Otherwise,
you’d have people sequestering themselves away and shooting at cans until their Pistols skill was up to maximum level and they could shoot the wings off a fly at a hundred yards.

I kept shooting, *thwip, thwip, thwip*, and was eventually able to learn a thing or two. First of all, it *did* matter whether I was making an effort, because holding the pistol off to one side and covering my face so I couldn’t see what I was shooting at did nothing. Second, the skill ups got slower as I went, which I had more or less expected. Third, for whatever reason I wasn’t getting critical hits or misses. And fourth…

*Skill increased: Pistols lvl 12! (Skill capped at triple the value of primary stat SPD.)*

That was after what felt like about two hours of shooting, enough that my fingers had gotten numb. It wasn’t dawn yet, but it was noticeably lighter now, enough to make the stars seem to fade away.

The message wasn’t clear on whether it meant SPD was a primary stat for that ability, or a primary stat because it was one of the basic ones. It was still enormously important in figuring things out, because it meant that not only did I know for certain that abilities were associated with skills, it also meant that I knew how important abilities were. My go-to plan of putting everything into PHY was basically shot now, because neglecting mental and social abilities would mean that I would forevermore suck at the associated skills. In other words, I couldn’t make up for lacking in cunning by being really, really good at skills that took cunning.

I shook my hand, set the gun down, and tried to think about what to do next. That was when I got hit in the side of the head with a rock. I swore, dropped down, and was grabbing for the gun just as I heard Amaryllis shout, “You’re dead.”

I rubbed at the side of my head, which was bleeding slightly. My hit points were down to 24/27, which didn’t seem right to me. I stood up, picked up the gun, and walked over to Amaryllis. If she had been standing beside the house, I might have had an excuse for not seeing her before her rock hit me, but she was on the opposite side of me from the house, which meant that she had to have snuck around me without making a sound.

“Sorry,” I said as I wiped my bloody fingers on my shirt. I belatedly realized that I didn’t have a change of clothes; I’d be wearing that stain for a while yet.

“You were on watch,” said Amaryllis.

“I know,” I replied. “I was looking around, I just, I wanted to get better for when we get to Silmar.”

Amaryllis paused and her face softened slightly. “And did you?”

I nodded. “Fewer misses, better clustering on the hits, both while moving further away from the targets.”

“Unnatural improvements?” she asked.

“Yes,” I replied. “I think so.”

“You left me while I was asleep,” she said with a frown. “While I was at my most vulnerable. If I could sneak up on you, so could someone else. I could have had my throat slit because you violated our agreement. Don’t do it again.” She turned away from me. “Come on, we should get going.”

Generally speaking, when I made maps I included as few details as possible. The bare minimum for tabletop worldbuilding was a starting location and a destination, with nothing but those two points
and a line connecting them to each other. Of course, a world with only those two initial necessities would seem barren and lifeless, so I would add things in to give the impression that it was a living, breathing place. A line marks a river that needs crossing, which implies a bridge, a forest runs alongside what are presumably fields, and there are other roads aside from the one between the only two 'real' locations, which go off and (presumably) connect to other places. Keeping a simple map with a lot of suggestive elements helped when one adventure rolled into the next one, because one of those lines could be attached to a new location that I’d thought up. By not marking down too much ahead of time, I was free to improvise when players asked me things, things like “Is there a wizard’s tower nearby?” or “Where is the nearest place we could find some trolls?” A detailed map would have left me scrambling to change things around when I needed the world to be different from what I’d originally put down.

I mention this mostly because the area we traveled through was almost exactly the sort of nondescript place that separated the two points of importance. It was flat (former) farmland as far as the eye could see, broken up with occasional streams and clumps of trees. There were farmhouses and the occasional gas station, miles of electric poles stretching electricity across the land. It could have been Kansas, or Nebraska, or virtually anywhere in the Midwest. If this place had been a character, it would have been the blandest of NPCs, the shopkeeper who sells you his wares without giving so much as a hint of having any personality or motives.

I shot at things as we went, using the rifle to do so. Amaryllis had suggested it. We were only going fifteen miles an hour, after all, and while the zombies were fairly infrequent so long as we stayed clear of places with a lot of buildings, there were road signs, trees, and rocks for me to take aim at. This time, I got the message much sooner.

Skill increased: Rifles lvl 6! (Skill capped at triple the value of primary stat CUN.)

That made me nervous for the value of my choices thus far, and with some reluctance I put my two points in raising MEN (and thus CUN, KNO, and WIS) by one. It wasn’t just a matter of rifles, I really didn’t want to get locked out of being able to perform magic.

We stopped after four hours of travel in the middle of a long stretch of road with no one in sight. My legs and back were killing me, and I was as hungry as I thought I had ever been back on Earth. I’d picked up an affliction “Hungry” but it didn’t appear to have any penalties associated with it. I imagined that like “Cowardice” it would get worse if I didn’t do something about it, and tried to ignore both the hunger and the looming status effects.

“Forage should get better as we move toward Silmar,” said Amaryllis. She was going through a stretching routine that looked totally unfamiliar to me, moving with smooth motions that paused in difficult-looking configurations. She would have looked amazing while eating a ham sandwich, but during these stretches I felt my heartbeat pick up. Maybe there was a part of my brain that thought she was dancing for me.

“You think we’ll find something to eat?” I asked, trying to ignore her.

“Silmar was the site of the attack that created the Risen Lands,” said Amaryllis. “They’ve been dropping people here for years, all over the place, but if you want to survive you move away from Silmar. It’s basically been untouched. Most of the food will have gone bad anyway, but we have better odds of finding things that are unspoilt. Besides that, the field effect was stronger near the epicenter, which means that rats and birds would have been caught in it too.”

“And … that’s a good thing?” I asked. Before she could answer, I realized what she’d been saying. “ Meaning that animals wouldn’t have gotten into everything, because they’d have been zom … turned into glowing-eyed undead versions of themselves.” I tried to think about that some more. “If
I’m hearing you right, a weaker version affects larger things?”

Amaryllis shrugged. “It’s academic,” she said. “I would rather stick to telling you the things that could save our lives in a crucial moment rather than going over esoterica about the necrotic field effect present in the Risen Lands.”

Maybe if I hadn’t been so thoroughly chastised for shirking my watch duty, I would have tried to push back, but I was on edge thinking about getting a message that loyalty had dropped. Amaryllis was someone the game deemed important and I figured that if I lost her, I was as good as dead.

“Do you think the Fuchsia Coterie will follow?” I asked.

“If they can,” she replied, craning her head back to perfectly expose her neck. “Part of the reason we’re going to Silmar is that I expected them to have arranged themselves to intercept us going the other way. I’d say there are even odds that they can get a vehicle up and running, if they didn’t have something equivalent in their supply cache.”

“Supply cache?” I asked.

“That’s a guess on my part,” said Amaryllis. “They didn’t leave the plane armed, and their weapons weren’t outside of the norm for what might be found, but it strikes me as suspicious that so many of them would have found weaponry. There are laws against flying over the Risen Lands, but they’re poorly enforced. It wouldn’t have been trivial, however … someone spent a fair amount of personal and political capital in order to have me die in a way which could be vigorously denied afterward. In the Lost King’s Court, it’s acceptable to murder your opponents, so long as you don’t let anyone know that you’re doing it. So yes, I believe that the Fuchsia Coterie is better supplied than one would expect of men dropped into this wasteland with nothing but their clothes.”

“We’re better equipped than I would expect,” I said, looking over at the pistol and rifle that sat beside the motorcycle powered by human souls. It still had seven souls in the tank, I noted.

“Our enemies have made the crucial mistake of underestimating a Penndraig,” said Amaryllis. She stood up, rolled her shoulders, and began walking back over to the soulcycle. “Though one has to wonder how many Penndraigs died almost immediately after making a statement like that.”
We made one last stop when Silmar City was in view on the horizon. All I could really see of it was that it was less reflective than I thought of cities as being; whatever materials the taller, skyline defining buildings were made of, it was something gray instead of glass. All that could be held off for later though, because I had been preparing to speak with Amaryllis for the last long stretch of road.

The plan we'd come up with didn’t really deserve to be called that.

Anglecynn had established a research base within Silmar City to study the effects of the necrotic field effect. Part of their remittance was a teleportation key, which was apparently an incredibly valuable and literally irreplaceable bit of magic which allowed organic beings the ability to teleport, a process which was apparently lethal if you didn’t possess one of these magic items. (Amaryllis hadn’t called them magic items, but I called it like I saw it.) Amaryllis was on part of the council that had established this base, and when it had stopped responding, there had been something of a panic, mostly because an operation to recover the teleportation key was going to be necessary and there was no money in the black budget to fund said operation, and pulling in more funds would have required other council authorizations that would have brought significant unwanted attention on the faction within Anglecynn that --

“Blah, blah, blah, politics,” as Reimer would have said.

I didn’t want to treat everything she was saying as essentially flavor text, but Amaryllis didn’t seem to be in the mood for giving me a civics lesson, and I wasn’t especially enthusiastic about trying to untangle all of the assumptions implicit in the background she was giving me. And there were other parts that mattered to me much more, such as:

“Assuming that you’d found the money in the budget to retrieve the key, what would that have looked like?” I asked.

Amaryllis frowned and knit her eyebrows. “There would be a series of advisors to develop the plan,” she said. “However, in lieu of that, and with the caveat that I might be missing something major … it would likely have been a team of five or ten, because that’s the increment the teleportation key applies to, three casters of different flavors among them in order to provide redundancy in getting back, plus one brute, possibly a caster himself, linked through the soul in order to take the hits himself, plus at least a single blade-bound warrior to scythe through lesser threats. They would have cleared forward to the facility, attempting to identify the threat and prepared to teleport back out if things exceeded their abilities, then depending on what they found there, they would have gone in and done their best to find the key based on the facility floorplans that they would have acquired ahead of time.”

“Ahh,” I said slowly. “Are you sure we want to do this?” That was a question that I asked a lot as a DM, mostly as a signal to the party that they were going to do something incredibly dumb.

“Yes,” she replied. “I’ve evaluated the options and this is the one least likely to end up with me in a shallow grave.”

“Alright,” I replied. “Then before we go, I want you to teach me magic.”

“That’s impossible,” said Amaryllis with a shake of her head. “Even the simple magic, like what I’m able to do, takes years of study. I know three spells, none of which you would be able to do without
at least three months of intensive study.”

“And if my power applies to magic too?” I asked.

Amaryllis paused. “We can spend a half hour,” she said. “Time is only of the essence because of the possibility of the Coterie behind us, and I think we can spare a little bit for testing. Tell me what you know about blood magic.”

“Uh,” I paused. “Nothing. I mean, I have some guesses, but nothing immediately springs to mind.”

“Guess for me please,” she said.

“Well … my guess is that it would be something like what I’ve seen before, back on Earth,” I said. “So maybe blood magic is the ability to control blood telekinetically, or maybe it’s using your blood to store spells from other sources, or maybe it’s tapped into the elemental plane of blood, or maybe you have to drink blood to take on the blood’s power, or maybe you have to spill your own blood as a sacrifice in order to fuel different effects.”

Amaryllis was giving me a funny look.

“Was one of those correct?” I asked.

“No,” she said. “The depth of the dream-skewer astounds me sometimes.” I frowned at that and she hurried on. “No, blood magic taps into the raw, vital essence of the body, tapping it and shaping it for other purpose. The most skilled blood magi can extend their power beyond the body itself, extending their essence into the shape of a tool or weapon.”

“And these weapons are … blood whips or something?” I asked. That seemed a lot like telekinesis to me.

“Whips would be nearly impossible,” she said. “The energy of the body only obeys the laws of physics reluctantly. No, spears are the most common. That sort of magic is beyond my level though, and I’m only telling you about it for the sake of illustration. For now, close your eyes and feel your blood pumping within you. Listen to the beat of your heart and feel your pulse, not with your fingertips but just as it flows through your neck, your arms, your thighs. Open your eyes.”

When I opened my eyes, she was standing closer to me, and if I hadn’t been able to feel my pulse before, I probably would have felt the rush of blood then.

“This next part normally causes some frustration,” she said. “Once you feel your blood, truly feel it, not just as some part of you that operates automatically without your involvement, you have to think about it in parts. Think about the warmth of your blood, think about how your fingers would feel if you tied them up with string and cut your circulation, then think about the warmth of your blood spreading back into them.” I did as she said. “That’s an exercise we practiced, but we don’t have the time for it now, not to do properly, and don’t want to risk your fingers.” I nodded, still trying to feel what she was talking about. This was sounding more and more like some kind of ki system.

“Now,” said Amaryllis. “Call on the warmth of your blood and push it to your fingertips.” She concentrated on her index and middle fingers, which ignited with flame. She let me watch for a few seconds, then it disappeared, with no apparent ill effects. “Now you try.”

I did as she had instructed me, feeling my blood, feeling its movement, feeling its warmth, then pushing that warmth to my fingertip - which lit up with flame.

_Unlocked skill: Blood Magic!_
Achievement Unlocked: Thicker than Water

Spell discovered: Aarde’s Touch!

Amaryllis stared at my lit finger. I stared at my lit finger. A small, blood-red bar popped up in my lower right field of vision. When I released the mental sense of pressure I was placing on my fingertip, the flame went out. Neat.

“Who is Aarde?” I asked.

“A god,” Amaryllis replied. “That spell took me months to learn. Months. I had the best teachers in the world and literally centuries of institutional knowledge on how best to coax someone into understanding. You … had me, giving you a haphazard lesson from incomplete memories, over the course of a few minutes, when both of us are half-starved. It should be impossible, unless …” She stopped with downcast eyes.

“Unless?” I prompted.

“Unless you knew blood magic in your previous life and the skewer took you only incompletely,” she replied.

“No, I think it’s the game thing,” I said. I stuck out my finger and lit it up again. It was much easier the second time and took no more effort on my part than snapping. The mana bar wasn’t moving at all, and didn’t seem to display any numbers for me. “What’s the limiting factor on blood magic?” I asked.

“Personal skill,” said Amaryllis.

I frowned at that. I was pretty sure that the game wouldn’t be showing me a mana bar that represented personal skill. I spread the flame across my fingertips, then covered my entire hand in it until it was blazing like a torch. “So I can keep doing this indefinitely?” I asked. “Does this do anything other than provide light?”

Skill increased: Blood magic lvl 1!

Amaryllis’ mouth was agape at my display, which I have to admit felt quite good. “The light it produces is a reflection of the heat you’re invoking,” she said. “It doesn’t have much utility, though you can go around without carrying a lighter. I swear the reason smoking was even remotely popular at the athenaeum was that it allowed people to show off their proficiency.”

I nodded at that, then let the warmth leave my hand and the fire wink out.

“So what you’re saying is that we could have had a fire last night?” I asked.

“A fire clearly visible from miles in every direction, yes,” said Amaryllis.

“Ah,” I replied. “Point taken. Wait a minute, I need to see what the spell looks like in my head.”

I closed my eyes for three seconds and called up the character sheet, then navigates to the page where “Spells Known” were listed. The page had changed somewhat since last time I had seen it; there was now a heading for Blood Magic and below that, Aarde’s Touch.

Aarde’s Touch: Channels the warmth of your blood to create a small fire at your fingertips, which does not burn you. Objects set on fire or heated may still harm you. Saps heat from your body and may leave you feeling chilly if used too long. Consumes 0 drops of blood.
“Huh,” I said, opening my eyes. “This spell … doesn’t make a lot of sense. Flames are a result of oxidation, aren’t they? I mean, that hasn’t changed in this world?”

“You would have to visit the Athenaeum of Quills and Blood if you want to know more,” said Amaryllis, and while that was a pitch-perfect NPC line, no quest popped up for me. “I had a knack for it, but I’m a novice … though if you were just wondering whether flames are caused by oxidation, then yes, they normally are.”

“By my count we’re not yet through the half hour,” I said, lighting my hand and then letting it extinguish as my concentration lapsed. “And you said that you knew three spells.”

Amaryllis nodded. “Fine then, something more advanced in the realm of blood magic,” she said. “Feel your blood coursing through your veins, then feel your pulse, feel the movement of it within your veins.” She made a fist with her slender fingers, which somehow didn’t seem threatening at all even though everything I knew about her indicated that she was fully capable of kicking my ass.

“Now, draw back, and with the next pump of your heart, as you feel the blood flow down your arm - -” Her fist blurred through the air and made a sound like the swing of a baseball bat through the air.

“Draw on the force of your heart. If you manage it, tell me what information you learn.”

I made a fist and concentrated on my blood. I was fairly sure that I had never tried to focus on the pulsing of my blood in my veins before, and if I had, I wouldn’t have been able to actually tell when the blood was moving, especially since it was necessarily moving in both directions. But here, on Aerb, I could feel it, almost keenly when I was paying attention. I reared back, tried to set my tempo to the beat of my heart, then --

**Skill increased: Blood Magic lvl 2!**

**Spell discovered: Crimson Fist!**

It seemed like an unbelievable amount of power to be put into a fist, and I went off-balance, stumbling slightly before regaining my composure.

“It’s called Crimson Fist,” I said.

Amaryllis nodded. She didn’t look happy. “And you picked it up on your very first attempt, having been introduced to the concept of blood magic only half an hour prior,” she said. “That’s troubling. I’m more convinced than ever that it’s imperative we get you out of here, somewhere you can be safely … diagnosed.”

That long pause? That was troubling. I put that on the back burner and closed my eyes to look at the spell.

**Crimson Fist:** Channels the force of your blood to gain kinetic energy in the form of a punch. Your fist is in no way protected by this spell. Drawing on this spell too often may leave you feeling sluggish. Consumes 3 drops of blood.

I opened my eyes and looked at the mana bar in the lower right of my vision. As I did, it gained a label, “Blood” and numbers appeared on it, “75K/75K”. I tried to do some quick math on that, but numbers had never really been my strong suit. The body had 10 pints of blood or so, I knew that from research I’d done before we played a one-shot of Vampire: The Masquerade. Were there 7,500 drops in a pint? That sounded plausible. At any rate, the bar hadn’t moved, and there weren’t enough significant digits to see the numbers change.

“Is it possible that you’re not right about limits?” I asked. “The description shows a cost in terms of
blood.”

Amaryllis frowned. “So from your perspective, you’re simply being told things by this … game layer, you called it?”

“Yes,” I replied. “It told me your name before --” Poul, who you killed. “Before it was revealed to me.”

“There is some cost in blood, yes,” said Amaryllis. “But it’s usually considered so marginal that it’s not worth thinking about. There are aspects of discomfort as well, but they’re survivable.” She hesitated. “To wield a blood sword does require the blood to be drawn from the body, but traditionally a blood magus would have the skill to return their vital essence to themselves with none lost. If the rules of progression are different for you, I have no idea what might happen. It might be dangerous.”

She turned to look at Silmar City on the horizon. “Our allotted time is up,” she said. “The only spell I know is the one for sleep, and it’s not only unattached to a school, but there’s no way for me to safely demonstrate it, or you to safely practice it, at least as we are now. More to the point, it won’t help us when we get there.”

I was itching to unlock another magic skill so that I could start leveling it, but I knew part of that was just a desire to feel ready for whatever was ahead of us. We’d had little luck in foraging, only enough so that I hadn’t hit another level of hunger. But this was it, here and now; we were going into Silmar.

I’d expected Silmar City to resemble Wichita or Omaha, differing mostly in a few small details, which had been the general theme I had seen thus far. Instead, there were no less than six thirty-story tall castles in place of skyscrapers and a twenty-foot tall stone wall forming a loose circle around the city. There were nothing like suburbs outside the city walls and very few buildings in general, save for a tiered parking garage some distance from the gate and what looked like an administrative building near that.

“Shit,” said Amaryllis as she slowed the soulcycle to a crawl. “The gate isn’t open.”

“Is that … unexpected?” I asked. The gate in front of us was made of metal and glowed with sigils similar to the ones that I had seen on the grain elevators in Comfort.

“Not entirely,” said Amaryllis. “Most cities close their gates at night. But we’re going to have to find a different way in. And … hells, if all the gates are closed, then the undead haven’t had an opportunity to fully spill out into the fields around us. That explains our easy approach, I suppose, but it means that there are millions of them in there.”

“And if they group together, they form up,” I said slowly. “We … don’t actually have a reliable method of killing the big ones. Or that sleek one that almost caught up to us. And they seem to get smarter when they’re bigger, at least capable of rudimentary tactics. And if they come in bigger sizes than what I’ve seen, and those bigger ones have human-level intellect …” I trailed off. Well, we might be fucked.

“We’ll figure it out,” she said. She turned around in her seat to look at me. Our faces seemed startlingly close. I could see flecks of silver in her icy blue eyes. “This is your last chance out,” she said. “I can give you the soulcycle and you can leave. We’re further from the Host’s outposts now, by a few days at least, but I won’t obligate you to risk your life to save mine.”

“I have your back,” I said.
Loyalty increased: Amaryllis lvl 3!

That gave me a warm glow, and I felt myself blushing again. She thankfully turned away from me before she could see it and looked at the door, which was as wide as a four-lane highway.

“The sigils there prevent most forms of force,” she said. “That’s mostly irrelevant to us, because we don’t have force anyway. The void guns could do it, eventually, but if that door is a foot thick … we’d be looking at the better part of a day to punch out a hole large enough for us to just barely slip through, and I’m not so confident in these weapons that I wouldn’t expect a malfunction before we were finished.”

“So we go around,” I said.

Quest Progress: Out of the Frying Pan - The main gates into Silmar City are blocked and you lack the capability to breach them. Find a secret entrance in order to get inside.

“Does Silmar City have any secret entrances?” I asked after I finished reading the text.

“If it does, they’re not known to me,” said Amaryllis. She momentarily tightened her grip on the soulcycles handles. “Your power is telling you something?”

“It mentioned secret entrances to me,” I replied. “I was hoping that it would jog your memory.”

Amaryllis shook her head. “This place was known to me mostly because of the facility here,” she said. “I never visited it back before its fall, and obviously not since.”

“Do you know what the walls are for?” I asked.

She gave me a quizzical look. “They’re primarily for defense,” she said. “What other purpose would the wall serve?”

“Defense against what?” I asked. “If it were defense against the undead then they would leave a door that the undead couldn’t get through, right?” Mustn’t say the z-word. “Obviously they weren’t preparing to defend against the undead, but they were preparing to defend against something, otherwise why would they spend so much time, money, and wasted development on these walls?”

(I wasn’t entirely sure it was true to say that they had to have walls for a reason. In a game, even one that I was responsible for, there were setting details that just didn’t make sense. I hadn’t yet definitively found those in Aerb, just things that I lacked an explanation for, if you get the difference. I wasn’t one to condemn a setting because there was no immediately apparent answer, only if there was no possible answer that didn’t require jumping through a thousand hoops.)

“The defense is general,” said Amaryllis. “A wall of this nature isn’t difficult to build and maintain for a corps of steel mages, not in the post-Bessemer era, and they can move it virtually at will in order to allow for expansion. Besides, it’s useful to have a city with clearly defined ingress and egress points, not just for taxation of goods, but to control the movement of population.”

“That sounds suspiciously like a non-defensive use of a wall,” I said. “If the wall is there to prevent people from avoiding taxes, then I would expect smugglers to have their own methods in and out of the city.”

“And how would we find them?” asked Amaryllis.

“That … is a good question,” I said. “Not here, certainly, not so close to where the equivalent to a border guard is, but if we circled around we might be able to find something. Not a tunnel,
necessarily, but -”

“It would have to be something that hypothetical smugglers were hiding from the city,” said Amaryllis. “That means that it would be hidden from us as well. And getting over the walls would be simple, for a smuggler, doable with only a long ladder.”

I felt certain that the game wasn’t lying to me though, since it hadn’t done that thus far. If we assumed that smugglers’ routes were going to be too difficult for us to reasonably find, then what could secret entrances mean? Amaryllis must have been doing her own thinking, because she was mostly silent. That suited me fine; I needed do less thinking aloud.

Cities were living, breathing things. They generally took in food and raw materials and spat out waste and finished goods. Unfortunately, the existence of teleportation magic complicated all that. Amaryllis had said that teleportation was lethal without a key, but there were a whole host of things people wanted to move which were already dead. The road into Silmar City had seemed somewhat small for its size, but that made sense if you assumed that bulk transport was almost completely removed from the equation. I hadn’t yet seen train tracks, and semi trucks were almost non-existent.

“What doesn’t get teleported?” I asked.

“Hrm?” asked Amaryllis.

“You use teleportation for moving goods around countries, right?” I asked. “What things don’t get teleported?”

“Water,” she said immediately. “It’s horrendously heavy in comparison to its value. Liquids in general are problematic, but water … that almost never gets shipped. It’s easier to just draw from a river instead.”

“Is there a river near here?” I asked.

“The Sarkan,” said Amaryllis. “It flows past Silmar City, on the other side from us. The walls actually touch the riverbanks there, I believe, with a bridge over it. What are you thinking?”

“That water has to be brought into the city somehow,” I said. “Presumably wastewater has to leave in a similar way. Maybe they’ll have grates up, depending on what kind of defense parameters they had, but my guess is that it will be nothing like these gates and walls, especially not on the outflow.”

“We’re going to go into one of the most stereotypically videogame places of all time: the sewers.

“We don’t have many other options,” murmured Amaryllis. “We should at least check the other gates to make sure that we can’t slip in that way. Going through the piping though … I suppose won’t be that dangerous, since the undead wouldn’t move into a restricted space unless they had reason to.”

A half hour later we were looking at a set of outflow pipes sticking out just above the water of the Sarkan River.

*Quest Progress: Out of the Frying Pan - The sewers of Silmar City are relatively unguarded. Make your way through them and out into the infested city.*
I had some serious questions about the quest system. What would it have done if we had decided to brute force our way into the city? What about if we had spent a few hours going back and grabbing a ladder, then awkwardly carrying it to Silmar City? What if we’d found some rope and fashioned a grappled hook? The quest system had inside knowledge of the environment we existed in, but where was that knowledge being pulled from? It was, to say the least, worrying, and I took it as proof that I was actually in a game, even if it was a game that was so far beyond any technology I knew as to be incomprehensible, one that I had been thrust into while in the middle of my life, and one that had given me an assurance that my death was still on the line.

It took us a few minutes to get through the grates on the outflow pipes using the void tunneler, but it was easy enough. The grate fell to the ground with a clank and we stared down the pipe, which was large enough for us to walk down without crouching.

“What about the soulcycle?” I asked, looking back to it. My butt was sore from all the riding we’d done, but I regretted leaving it.

“Good point,” said Amaryllis. She went over to it and pulled a long, thin rubber pipe off it, which she hooked into itself so it formed a loop. She slipped that over her head as a necklace. “There,” she said. “Now no one can take it. Not that we’re going back for it.”

“What about the souls?” I asked, looking at the tank, which still had the same seven souls sitting in it. I had to wonder about that; it didn’t seem like they were depleting, which meant my initial impression of them as being fuel like gasoline must not have been quite accurate.

“They’ll fade in about five years,” said Amaryllis. “It’s doubtful that anything will have changed in the Risen Lands in that time. She began moving back toward the outflow pipe.

“I’d like to take them with us,” I found myself saying.

Amaryllis regarded me for a moment, then shrugged. “Suit yourself,” she said. She reached into her bag and pulled out the empty glass jar, which she’d brought with us. “You know that we can’t bring them back to life, right? Not even if we wanted to, which we wouldn’t.”

It took longer than I would have liked to get the souls out, as apparently the tank was more designed for entry than exit. Amaryllis stood by and offered me no help, even though it was eating into our time. I have to admit that annoyed me a little bit, though it did give me some measure of what Loyalty level 3 actually meant. When I was finished, we finally headed into the sewers.

I led the way, with the void tunneler in one hand and fire in the other, which provided our only source of light. My sword was at my hip, though I was desperately hoping that I wouldn’t get into a situation where I needed to use it. Amaryllis followed behind me with the rifle. I’ll admit that made me nervous; from what I had seen she had good trigger discipline and impeccable aim, but if we ran into anything I was going to be between her hole puncher and her target. I didn’t think that she was going to shoot me in the back, but she was visibly annoyed at my skill with Aarde’s Touch, and clearly had no compunctions about murder. I hoped that didn’t play into her calculations on whether or not to take a shot.

There was a trickle of water flowing through the pipes, just enough that I could see which way it was
flowing. That made navigating the pipes nearly foolproof, since all I needed to do was go upstream. I was hoping to get to a water treatment plant or whatever the local equivalent was (a topic that Amaryllis had professed ignorance on). From there, we could break through doors or climb out windows and get onto the city streets of Silmar City, and from there start making our way to our objective.

The first sign of trouble was the corpse of a dead rat, which was partially decomposing and badly mangled. I stared at it for a long moment.

“What is it?” asked Amaryllis, who was stopped behind me.

“Rat corpse,” I said. I knelt down and looked at it. “From what you said, rats should have been caught in the stronger field effect here?”

“Yes,” said Amaryllis slowly. “Though rats would be risen as undead once they died either way. I was mostly referring to what would have happened during the attack itself. All of the rats would have turned undead all at once, all across the city. Same for the birds and humans.”

“Right,” I said. “So how in the hell did this rat die?”

“That’s not a question that I think we want to find the answer to,” she said.

But something about the rat was nagging at the back of my mind, aside from the simple question of what had killed it and what that implied about what was down here. I was also wondering what mental ability I would need to boost in order to have that thought at the tip of my tongue come to fruition, if any.

It was another few minutes before I saw a flash of red at the end of the tunnel, moving frighteningly fast. The plain old zombies were almost not enough to be considered threats, now that I was armed. The big ones, the Zombies Voltron, were slow enough that I could outrun them. It was the mid-sized one that we’d faced down just outside of Comfort that really scared me, especially in this environment, which would turn claustrophobic in a hurry if we had to run away. We had only a single void bomb left, and we were casting light that I assumed would draw any of the undead like moths to a flame.

I stopped in my tracks when I’d seen the two red eyes, and Amaryllis stopped behind me. I waited, tensed, for it to come forward, but it must have been moving through one of the side tunnels, almost perpendicular to us. There was a chance that it hadn’t seen us … but there was no noise either, not the slap of dead flesh against a wall nor the sound of a foot stepping in water.

“We have contact,” I whispered. I heard Amaryllis shift behind me as I raised my hand higher and put more of the heat of my blood into Aarde’s Touch so that it engulfed my entire hand from my wrist to the tips of my fingers. It still wasn’t terribly bright. I could also feel the chill that the spell description had warned about, but at the moment that was a lesser concern.

I waited another few seconds, then stalked forward with my gun pointed ahead of me. My hand was shaking slightly, which caused the tip of my gun to waver, which in turn increased my feeling of doom as I realized that I was going to have a harder time landing my shot. I almost lost what little cool I had remaining when the game gave me another inopportune message, this one about my ability with blood magic.

Eventually I came to the split in the pipes where I had seen the undead thing go past. I took a deep breath of mildewed air and quickly turned the corner. I got a shot off, thwip, right before it started moving, before I even had a chance to take in its form.
It was made of the corpses of rats, hundreds if not thousands of them, arranged with four limbs and reared back on two of them. It was a mess of wet fur and wriggling tails, with bits of legs and heads sticking out from between the bodies, all forming a solid mass. One of the things I’d be hesitant to call hands reached forward with a dozen rat claws arranged together and extended. I backed up, but it caught my left hand and left several long rows of deep scratches.

**New Affliction: Rat Rot! (END -1, CUN +1)**

I had no time to process that, because I was trying to back up and kick at the rat thing so it couldn’t get close to me. The second time I tried kicking it in the chest, my foot seemed to sink right into it, the rat corpses parting way just enough, then crawling back around to hold my foot tight. I stumbled backward, losing my shoe to the rats in the process and falling on my ass in the shallow water at the bottom of the pipe.

I heard the solid *thunk* of Amaryllis firing her rifle and scrambled to my feet just in time to duck under another swipe from the dozens of tiny claws. Without thinking too hard I dropped my void gun, drew my sword, and swung with it. The sword sliced right through, cutting rats in the process. I saw bits and pieces falling to the ground, but the rat colony reformed itself to compensate and took another swing at me.

I raised my sword to block, but it rammed its arm straight through, heedless of the rats I was cutting up. The claws dug in and ripped away flesh from on the inside of my arm, right at my elbow, and I screamed out in pain as I pulled back and made a sloppy swing with my sword again.

**New Affliction: Blood Loss! (END -1)**

**Skill increased: One-handed Weapons lvl 4!**

My sword arm was wet with blood as I took another step back, and the mass of rats didn’t seem at all injured. I heard another *thunk* from Amaryllis, this one frighteningly close, and saw a number of rat parts drop off from a hole I couldn’t even see in the poor light coming from my flaming hand. I struck again, coming down at an awkward angle because my elbow had hit the side of the pipe, and cleaved straight through the swarm of rats from its shoulder through to its leg.

**Affliction: Blood Loss lvl 2! (PHY -1, END -1)**

I was feeling quite cold now, and somewhat dizzy, and the bar that seemed to be tracking my blood supply had taken a noticeable dip, and when the rat thing swept an arm toward me I wasn’t able to react fast enough to dodge or parry. It sliced through my stomach, cutting up the t-shirt and leaving long red lines.

Amaryllis pushed me to the side, which made me fall against the curved side of the pipe in a bloody heap. She stepped forward and punched at the center of the rat thing, moving so fast I heard the rush of air before her fist went straight through with a wet crunch. I let out a moan of pain that was meant to be panicked advice, telling her that we couldn’t deal with it that way, but then she drew her hand out of the rats and a split second later there was the muted sound of a void bomb going off. The rats all fell apart into a pile on the ground, most of them missing pieces.

**Umbral Rat Zombie defeated!**

I was worried they were going to swarm us, until I saw how slow they were, then I tried to move and realized how slow *I* was, which was when I started to panic a little. I was still bleeding, enough that I could see it pumping out my veins, as well as the visibly shrinking blood supply mana bar.
Amaryllis stomped the rats to death, one by one, moving with purpose, until none were left moving. Then she came to me and looked me over. Her own hand, the one she’d punched the rat thing with, was scraped up and bleeding lightly, but she moved as though unaffected.

**Affliction: Blood Loss lvl 3! (PHY -2, END -1, MEN -1, SOC -1)**

“Did you punch that thing with a grenade?” I asked her. I was starting to feel quite dizzy.

“Shut up and don’t move,” she said. She reached into her bag and pulled out a belt, which she quickly wrapped around my wounded arm and pulled painfully tight. Then she took out a screwdriver, which she rested against her pinky. She took a deep breath and set her finger on fire. She held it against the screwdriver, wincing in pain and visibly sweating, until the smell of burnt flesh was rising in the air and the screwdriver was red hot. I knew what was coming and closed my eyes, trying not to think.

The red-hot screwdriver came down on the pit of my elbow, where my vein must have been sliced open, and cauterized it with a pain that was surprisingly dull at first, then so sharp and white-hot that my whole body involuntarily clenched up. I almost couldn’t hear the sound of my blood and flesh hissing.

“You said leveling up heals you?” she said.

I nodded weakly, then dared to look at my hitpoints. **1/8. Lovely.**

“Well we had better make sure that happens in the next half hour, or I think you’re probably going to be beyond my ability to do anything.” From her bag she pulled out a strip of cloth, which she quickly wrapped around her finger. She didn’t so much as wince. If it weren’t for how she clenched her teeth, I might not even have known she was in pain. “We’ve got no void bombs left, you’re injured, and we still don’t know if we’re any closer to getting to the surface, let alone what we’ll find there. And encountering another one of those,” she paused to stomp on a rat that had gotten close to me, “Probably means that we die.” She looked down at her wounded hand. “Plus I think there’s a great chance this is infected.”

“We’ll manage,” I said as I struggled to my feet, something I tried my best to do gracefully and failed miserably at. I did manage to stand up eventually though. My estimation, based on the blood meter, I was down about two pints (the meter unhelpfully told me **61K/75K**). I wasn’t entirely sure that it would refill when I level up. I’d broken my arm and that had been fixed, along with its associated affliction, but the cowardice affliction had stayed in place for a few levels until I’d tried to save Becca.

Amaryllis took lead and I limped behind her. My pistol had been soaked in water, but still seemed to fire fine. On the other hand, the person firing the pistol was in bad shape. I didn’t want to look at my character sheet, mostly because there wasn’t going to be anything actionable on it, but if the ability stats worked like I thought they did, then I was down to two points of END and the combination of Blood Loss and Rat Rot was giving me the equivalent of stat equivalent of losing four levels.

**Affliction: Hungry lvl 2! (PHY -1, MEN -1, POI -1)**

Frick

“I need to look at my character sheet,” I said. It came out with a rush of air. I was practically panting.

“Go quickly,” said Amaryllis. “We need to keep moving.”
A quick glance confirmed my mental math; I now had four stats sitting at zero, all my mental stats save MEN, plus POI. I breathed a sigh of relief at the fact that it hadn’t actually killed me. A look at my skills gave me another bit of good news; so far as I could see, if skills were capped by their primary stat, it wasn’t obvious that having that primary stat reduced would also reduce my skills.

“Okay, we can keep moving,” I croaked out. The burn on my arm was excruciating. “I just needed to see --”

“Save your strength,” said Amaryllis.

I don’t know exactly how long it was that we moved through the tunnels. My sense of time and sense of self were both warped. My heart was hammering away through all of it, both because I was afraid of dying and because it was struggling to make do with far less blood than normal. We encountered a few other zombie rats, but none of the monstrosities, which was a good thing, because we both would have died. We also came across another of the mangled rat corpses, which I finally understood. The rat-horde beast used corpses as feet, bringing down hundreds of pounds on the lowest ones each time it took a step.

Eventually though, we came to a ladder that led to a grate, and that grate led us up into something vaguely resembling a place meant for people, with metal walkways and unlit overhead lights. More importantly, it had a door, which promised other doors, one of which would lead us to the outside. I sat down and rested my head against a railing, then gestured toward it.

“Look, we found the way to more zombies,” I said.

“Don’t say that word,” hissed Amaryllis.

“Sorry,” I replied. My throat was barely working.

“Do I need to let you get the kills?” she asked.

It took my mind a second to work through what she was asking me. “Oh, don’t think so,” I replied. “I get a message when you kill things for me.”

“I’m going to leave you here then,” said Amaryllis. She shifted the sling on her rifle. “Moving alone I can cover ground faster, which means that I can scout out ahead and engage in hit and run tactics if need be. I’ll come back for you with food and medical supplies as soon as I find them. If what I do helps you to live and we’re separated from one another …”

“Meet up,” I said, nodding my head because I couldn’t keep my neck straight.

“Meet up,” Amaryllis agreed. I could see the way she clenched her jaw. “Twenty-first floor of Sorian’s castle, that’s where the facility is. I’ll … I’ll try to wait for as long as I can, if I can’t make it back.”

She left me, out the door without another word. I closed my eyes and wearily pulled up the settings menu, then checked the “Helldiver” option. While I was there, I tried to uncheck some of the options, like the one informing me that this was my one and only life, but of course those options stayed locked, as I had known they would.

And after that, I just waited for a while, staring into the darkness because I was too cold, tired, and low on blood to use Aarde’s Touch to light the room. I thought to myself, so this is what dying feels like, and then amended it to, this is what dying from blood loss feels like, and then amended it a second time to, this is what heavy blood loss feels like, regardless of whether you die or not, because I didn’t actually know that I was going to die, did I? In what I still thought of as the real world,
people survived much worse injuries than this on a daily basis. I checked my health and mana; 2/4 health, 59K/75K blood. I had gained back a point, presumably by not dying for long enough that my wounds had started to close a little bit. The same thing had happened after Amaryllis had hit me in the head with a rock.

If I had been waiting for anything, it was for Amaryllis to kill something and a message to pop up on my screen, but I had seen nothing like that. After maybe a half hour on the uncomfortable floor of this industrial room in the complete darkness, I decided that being left for dead by Amaryllis with just enough pretext to make me not blame her (and her to not blame herself) didn’t mean that I actually had to die there. So I climbed to my feet, feeling wounds on my stomach, hand, and arm slightly reopen. I tried to use blood magic to light my way, but my blood pressure was too low for me to feel my pulse. Instead, I stumbled forward, holding the railing and saying a silent prayer of thanks to whatever Silmar City’s version of OSHA was.

It took a long time, enough for another thousand drops of blood to drip out of me, but I made it to the door and opened it, which provided some very dim light from down the hallway. I moved toward the light, leaning up against a wall as I did so. My toe kicked a corpse after a hundred feet; there was just enough light to see a perfect hole right in his chest. And her kills aren’t counting for me, just lovely.

After a turn in the hallway, I was in the light. There were half a dozen corpses here, and by the look of them they had been reverted from undead back to dead again by someone with a void rifle, three guesses who. The light was coming in from a high window, too high for me to see out of even if I had been in good enough condition to stand on my tippy toes.

I moved through more doors and down more hallways, taking the path that Amaryllis had left whenever it was obvious. I encountered no zombies of my own, just the destruction she’d left. There was something frightening about how methodical she was, how precise she was with her shots, enough that it pushed me just a little bit out of my haze. The zombies were slow, sure, not much of a challenge, but it still took effort of will to face them down and wait for the perfect moment.

Finally I reached wide double doors with frosted glass windows on either side of them. It took basically all my strength to lean into the handle and push the door open. Before me stood Silmar City, high walls behind me, a brief stretch of lawn in front of me, and beyond that, towering over office buildings, were six improbably immense castles. That wasn’t what drew my attention though; standing tall enough that its head was visible over three story buildings was another creature made of corpses, with red eyes so bright they reminded me of a lighthouse.

*Quest Complete: Out of the Frying Pan - You have made it to Silmar City!*

*Level Up!*

*Quest Accepted: Into the Fryer - The teleportation key lies in a secret research facility nestled into the top level of Sorian’s Castle, one of the six corporate castles in Silmar City. Get the key, find Amaryllis, and leave before her friends show up.*

I sank down to my knees as the golden wave of bliss took me, but it lifted me partway up, supporting me entirely as it shook my body with ecstasy. It seemed to last longer this time, long enough that I felt myself in its grip. When it stopped, I felt this hollow emptiness, as though I’d been pithed. And yet that sensation didn’t last that long, because I was also whole, devoid of affliction, all my blood back in my body, and I wasn’t even hungry anymore.

I stretched out and smiled, then went off to find Amaryllis.
I don’t think I can overstate how great it was to have all my blood back. It made me almost empathize with vampires a little bit, because if it felt this good to have all my blood back in my body, how great would it be to add in even more blood? Of course, that feeling was nothing that I was going to share with anyone on Aerb, because vampires probably did exist here given how often they’d shown up in my games. I guess I could only hope that they were the ones I’d used in Contratto, with a single point of failure for every vampire clan.

Blood magic felt almost natural now. I barely had to think about the heat of my blood to get a flame on my fingertips. I was dead certain that there were other applications to blood magic, given what I had seen of it so far, but I wasn’t sure whether I was going to be able to learn them without outside help, or given Amaryllis’ warnings, whether I would want to learn them without outside help.

Before I went too far from the water treatment facility, I stopped to assess my character screen and dump more points into MEN, mostly because I now knew that there were physical combat skills like Rifles that depended on it, and partly because being a human torch in the sewers had capped me on Blood Magic (which was, apparently, governed primarily by WIS). There was no noticeable effect from putting those points in, unlike the instant feedback of getting stronger and faster, which was disappointing.

With that done, I had some decisions ahead of me. Obviously step one was to find Amaryllis. It might have been different if she didn’t have a vital connecting hose to the soulcycle around her neck and all seven souls needed to start it in a glass bottle in her purse, but she had both those things. That meant escape from the city was going to be much more complicated than just tracing my way back through the sewers and hoping I didn’t run into rats we’d missed the first time.

(It did occur to me to do that, maybe after foraging for some food, or maybe depending on leveling up at a fast enough rate to combat the hunger affliction, but it seemed perverse, in a way that I’m not sure I can articulate. As a DM, I had always felt a cold chill run through me when the party decided they were going to take up raising dire goats instead of going down into the Castrato Caverns like the dwarven matron wanted them to, partly because I was prepared for the castrated dwarven criminals storyline but knew next to nothing about raising goats. So maybe my feeling was that there was a contract between players and game, and I had a quest to get the key and find Amaryllis. To deny that quest and fuck off to do something else was to spit in the face of the game, and I respected games too much to do that.

And I won’t deny that there were some sunk costs involved in pursuing this quest, in the sense that I had already incurred the costs involved in getting into Silmar City, and maybe there was a tiny bit of sunk cost fallacy going on.

And … well, I hesitate to say this, because it makes me seem no better than a preteen girl mooning over One Direction, but Amaryllis was really pretty and there was something about coldly practical princesses that I apparently found really appealing.

I guess my point, if I have one, is that maybe there was a more sensible thing that a perfectly rational actor could have done, but I had my own reasons.)

The problem with finding Amaryllis was that stupid Verisim mode was on, which meant there were no quest markers showing up on my HUD or painted lines on my minimap, or however that would have worked if I had been able to enable it. All I had to go on was “the twenty-first floor of Sorian’s castle”. I wasn’t even sure whether going there was my best option, because I wasn’t sure that
Amaryllis would try to make her way directly there. She was capable of making void bombs out of… well, *something* that she had apparently been able to get from somewhere in Comfort. I had no idea what she had ripped the void crystals out of, except that Poul had said something about an imperial ban. That wasn’t very helpful.

So instead of bumbling toward the local equivalent of downtown, I decided to do some good old fashioned looting, and I made myself a shopping list in my head as I went, including things like a map, new clothes that weren’t ripped and bloody, new shoes that weren’t soaked through with sewer water, and a backpack so that I could have some actual possessions.

One of the weird things about what had happened to the Risen Lands was that it had left pretty much everything intact. Buildings were still subject to the elements and the zombies, as well as whatever people got dropped in from planes, but the zombies didn’t really seem to be in the business of mindlessly destroying things unless there were people in the way, and buildings were built to withstand normal weather conditions. I wasn’t sure exactly how many years had passed since this place had become known as the Risen Lands, but at times it was easy to imagine that it had been yesterday, or that it wasn’t abandoned at all and the people had stepped out.

Back on Earth, my dad had been big into helping people out, and a few times I went with him when he would bring his truck and tools across Kansas to help people who had suffered through tornado strikes. Back in 2011 I remember going to Reading and helping pick through piles of merchandise at a yarn store to see what was salvageable after the roof had been torn off and let the rain in. As tornados went, that had been a bad one, an EF3 hitting the town almost perfectly … and yet we’d gone through Reading only a few years later, and even though half the town had been destroyed it was almost all back in place, all except the trees.

So as I wandered through Silmar City, I was looking for places that I thought I’d be able to loot, but I was also thinking about this city and what had happened to it, and what that said about the world. Something like a half a million people had died all throughout the Risen Lands, and the place was made into an exclusion zone, never to be touched again, leaving what had to be trillions of dollars of infrastructure laying around to rot. It wasn’t just the sheer amount of stuff laying around, but the farmlands themselves, farmlands which seemed to still be fertile. All of it had been bundled up into an exclusion zone where no one ever went. For what reason?

I lost my train of thought when the tall buildings I assumed were factories or office buildings gave way to places with shopfronts. The streets of Comfort had been in a nice, ordered grid like I was used to, but Silmar City took what I thought of as the Paris approach, where blocks were arranged in awkward wedges and streets were a spider’s web. For someone used to streets that extended on until they hit flat farmland that stretched to the horizon, it was pretty claustrophobic. When I saw a shop with clothing, I took that as a welcome respite from the abandoned streets.

The door was locked, but it was nothing that a quick *thwip* of the void tunneler couldn’t fix. I was really growing to love that thing. I moved slowly, trying my best to make sure the place was clear before I did something dangerous like trying on a pair of pants, and just for good measure I spent about ten minutes trying to hide in and around the store, just to see whether I would get a notification about my Deception increasing.

I was apparently still in a more industrial part of the city, because the clothes in the shop were geared toward hard labor: heavy fabrics, sturdy buckles, and an array of tools near the front counter. I found basically everything I wanted in terms of clothing over the course of the next twenty minutes, from a pair of steel-toed boots to a pair of heavy canvas jeans I hoped would offer a little protection against the claws of the undead. There were packs of clean socks and underwear, the kind always bought in bulk, and while they had a faintly unpleasant odor to them, they seemed to be structurally sound. It
was whatever the local equivalent of summer was, which made heavy clothing a little bit inadvisable, but I figured that was probably a price worth paying for armor, especially since I found a canteen for water, and a shoulder pack to stick things in. The only things on my shopping list I didn’t find were food, potable water, a map, and a multitool.

Of course, everything was just a bit off from what I was used to. The currency symbol seemed to be δ, placed after the (Arabic) numbers. The underwear had been packaged in a thin canvas bag rather than the thin, clear vacuum-pack plastic I was used to. There were no zippers anywhere; they used buttons instead. The aglets on my new shoes were metal, not plastic, and I didn’t think that was a simple matter of workmanship because none of the other shoes had plastic either. I knew that they had plastic in Aerb, but most of what I had seen was hard plastic or rubber. Did they not have plastic bags? The trash can beneath the shop counter had a paper liner rather than a plastic one, and yes, I did check specifically to sate my curiosity.

These attempts to study and understand the world were partly driven by my desire to bury myself in thought, to distract from all the problems I was facing, but I wanted so badly to know what kind of world this was. I had four quests to pursue here, but the most important goal I had was understanding the nature of this new reality I had found myself in. The metaphysical questions weren’t really actionable at the moment, I had decided that almost right away, but if I had a self-defined quest, then it would have been to get to the bottom of what this place, which was so steeped in my own thoughts and so reminiscent of Earth, really was.

I continued my trek through the city, stopping only briefly to listen for movement when there was an intersection ahead of me or when I wanted to read a sign painted on a storefront. Silmar Velocity Services, Planus Tattooing, and Eckhart Prognostications all caught my eye, but I moved past them when I saw nothing immediately interesting inside. I knew I could probably have spent years of my life exploring this city, with all its weirdness and quirks, even if I ignored all of the places that were obviously just eateries.

When I was a few blocks away from one of the towering castles, I finally found the thing I was most looking forward to: a bookstore. The name Able & Adler Booksellers was emblazoned across the front window, which was dirty but unbroken, and within I could see books on display, plus row upon row of full shelves behind them. I unlocked the door by shooting a hole in it, then went inside to see what I could find. My breath caught when I found a full section labeled “Magic”.

I started reading through the titles before remembering that this place might have zombies, so I grudgingly made a sweep of the shop before returning to my browsing. A Tour of the Elemental Planes, Insights into the White Spires, Bessemer: A History in Steel, on and on, each more tantalizing than the last. Their arrangement was haphazard, though there were defined clusters. Eventually I pulled out The Commoner’s Guide to Revision Magic and began reading (hoping all the while that I would get a notification about a skill unlock).

Revision mages are masters of time, able to reverse its flow with the strength of their will alone. The Athenaeum of Claw and Clocks is among the smallest institutions of learning, its members and graduates renowned for their solitary natures and their reticence to display their most fabled abilities.

It is with great honor that I accepted the invitation of Mistress Audrey Lavolen to discuss revision magic, its role in the workings of Aerb, and some common misconceptions about what it can and cannot do, the latter issue being one of great importance to her. I also owe a great debt of gratitude to George Aurelio, who facilitated the writing of this book in too many ways for me to count.
The general rule of thumb is that revision cannot wipe things out of existence, only break them down into their component parts, and then only through sufficient application of revision such that whatever process created the object in question is undone (see Ch 4). When it comes to its interaction with other systems of magic, it’s important to remember that generally speaking, *magic* cannot be reversed, only the *effects* of that magic.

To wit, a steel mage can create a towering wall which is immune to the ministrations of a revision mage, because the magic which creates the wall cannot be undone and the revision mage cannot revert the wall back to a time before it existed. The same applies to the cluster of similar effects we call teleportation, because the revision mage cannot unteleport someone or something that has arrived, putting a hard limit on how far they can roll a teleported object back. Some of the caveats to this will be discussed in this chapter.

Contrarily, velocity magic is almost entirely centered around producing effects, which present only somewhat heightened challenges for a revision mage, challenges which have more to do with reaction times than actual expenditures of power. Tattoo magic --

But as I was in the middle of reading that sentence, the glass front of the shop shattered completely and I turned just in time to see a beast made of corpses lift up toward me. I stumbled and ran in a sudden panic.

I must have been lured into a false sense of security by the scarcity of zombies thus far in Silmar City, because I had neglected to prepare an escape plan from this bookstore. I ended up running down the aisle, with the corpse-monster chasing after me and pushing down bookshelves to get through. When I reached the back of the store I took a sharp turn and doubled back, moving between the shelves that had been knocked over like dominoes and were now resting up against the wall, stepping on books as I went.

I hurdled over the knocked-over display and into the street, then after a moment of hesitation turned down back the way I had come, which seemed like the safe option. Running at a dead sprint was a lot harder in the heavier clothes, and I was heating up quickly, but I was hoping to lose the monster behind me like I’d done back in Comfort. Unfortunately, speed was only half the battle, and I quickly found myself going down a street that I didn’t quite remember, which was exactly the sort of place that I didn’t want to be. I ducked down behind a set of stairs and waited with my gun drawn, hoping that I had made enough twists and turns and turns through the irregularly angled streets.

After a minute or so of waiting, I came out and started moving again, trying to find my position relative to the city center and the so-called corporate castles by the position of the sun. I desperately wanted to get back to the bookstore to continue reading, mostly in order to get some measure of just how many magic systems this one world could contain. I cursed myself for not doing the smart thing and pulling down random books to put in my shoulder pack before I’d started reading.

I wandered on, more wary than I had been before. I was on the lookout for Amaryllis, but if she had left any signs of her passing, I wasn’t seeing them. That left me essentially aimless, right up until I found a corner store with a stock of faded maps that gave the general layout of Silmar City.

The first thing I noticed was that the streets weren’t labeled. Instead, each block had a name on it, and the streets were merely the unimportant void between the blocks. That was the Japanese addressing system, and I was pretty sure that it would have thrown me for a loop if I hadn’t discovered and used that same system for a handful of major metropolises in my D&D games.
The second thing I noticed was Sorian’s Castle, helpfully labeled as its own big block of real estate. I breathed a sigh of relief and picked up a pencil off the counter to mark it, only to realize that it was some weird form of pencil with wrapped paper instead of wood, and a black core that had dried out. It crumbled as soon as I tried to write with it. *Note to self, if I’m stuck here for awhile, I should try to invent graphite.*

I moved slowly, creeping my way along as I moved toward the castle. I didn’t think that the stories-tall corpse monstrosity would be able to sneak up on me any more than Godzilla could have, but it wasn’t the only thing that was stalking these quiet streets. The lack of plain old zombies was a little bit concerning, since it meant that I couldn’t snipe them for skill ups. It also meant that they had all been rolled into the bigger versions.

I was about three blocks away when a woman in fatigues came running around the corner, straight toward me. She was carrying a bow that was almost as tall as she was. When she saw me, she gave me a smile and a salute.

“Better follow!” she called to me as she sprinted past. I found out why a few seconds later, as two of the semi-trailer-sized zombie-things came following after her. I ran, naturally. It was only as I was running that I realized the woman’s ears had tapered to a point.

She was faster than me, but when I followed down the street she’d took she was standing there with an arrow nocked and aimed right at me.

“To the side!” she called.

I didn’t need to be told twice. I ran to the sidewalk, then continued up it until I was past where she was. It wasn’t until that point that I turned to look behind me. Naturally I was certain that a bow was an incredibly ineffective weapon against a creature like that. You had to hit the individual hearts of enough zombies that it would fall apart, and even a well-aimed arrow would be lucky to get two hearts. I didn’t say any of that, because I didn’t want to be the asshole who tells someone that they’re doing it wrong right before they knock it out of the park.

When she released the string, the arrow zipped through the air, until it was ten feet away from her. There, still in flight, it split into two identical arrows, and after another ten feet, each of those split into two arrows, on and on, until it was practically a cloud of arrows all flying through the air, loosely clustered together. They struck the zombies with the sound of wet flesh being pierced a hundred times and the umbral zombies, both of them, tumbled and fell apart. A number of the component zombies got up from the ground, some of them with arrows stuck through them, but they were slow and shambling, not really a threat unless they had you cornered.

The elf grabbed her bow in both hands and stretched with it over her head while yawning. “You’re welcome,” she said.

“Thanks,” I said. I was looking her over. The fatigues she was wearing had no insignias or other symbols on them. She was blonde, roughly as tall as I was, and with a smattering of freckles across her face, marking otherwise pale and flawless skin. My eyes kept being drawn to her ears, which came up into long points. “Though actually, you led those things toward me.”

“Hrm, so I did,” she replied. She sauntered over toward me and looked at the red-eyed zombies stumbling our way. “What exactly brings you to this part of town, hooman?”

“Uh,” I said, which was really not my best-ever stall for time. I needed a more clever way to delay before I started giving things away. “I was going to ask you the same thing.” *Nailed it.*
“Well, I see you’ve noticed the ears,” she said. “And the teeth as well, eh?” She smiled at me, and whatever she thought I had seen, her smile didn’t really help me figure it out, because her teeth looked normal, if a little bit unnaturally white. “Half-elf,” she said.

“Okay,” I said slowly.

“So your question should have been, ‘What brings you to this part of town, half-elf?’ instead,” she continued, looking at me expectantly.

I was paralyzed by a couple of things. First, I was standing in front of a real live honest-to-god elf (or at least a half-elf) just like I had seen in probably hundreds of source books and fantasy paintings. I figured I was probably going to feel the same way my first time seeing a dwarf too.

Second, and as an issue of actual importance, I was immediately suspicious of her. The odds of me running into anyone in this city were … well, hard to calculate, given that I didn’t know how many people were running around in Silmar City at any given moment. But the quest I had said ‘leave before her friends show up’, and that small bit of wording hadn’t slipped past me.

“Myself, I’m looting,” she said. “Violation of imperial law, that, but if the empire is going to just let all this stuff go to rot, then I don’t consider it the worst crime a person can commit to steal some of it away.” She paused. “And this is where you tell me what you’re doing here.”

“I’m,” I began. “Just sort of bumbling around.”

Skill increased: Deception lvl 5!

I was a bit miffed at that. I hadn’t really lied.

“Bumbling around,” said the half-elf with a nod. “I, too, often find myself wandering about in cities deep in the heart of exclusion zones, carrying makeshift pistols. There’s something that’s so freeing about being lost, don’t you think? An exhilaration that comes with being untethered from even the bare knowledge of where you are in the world, hrn?”

“Sure,” I said. “That’s … a nice bow you have there.”

Skill unlocked: Flattery!

That didn’t seem right. Had I never said anything to flatter Amaryllis? Thinking back I couldn’t think of a specific instance, but she was so damned impressive it seemed impossible I had never said so, or at least let slip how beautiful I thought she was in a moment of ineptitude.

“Oh, thank you,” said the half-elf. “Family heirloom, very valuable, but occasionally one likes to fire a volley of arrows. Your own … pistol? It’s very … rustic.”

I looked down at the pistol in my hand. “Look, I’m, uh, looking for a friend I got separated from,” I said. “Have you seen --” I thought about Amaryllis and how I would describe her, then thought twice about it. “-- anyone?”

“I don’t think the two of us have quite gotten to the point where we’re freely sharing information,” she replied, “And I’m sorry, but I have to place some blame for that on your reticence. Is there any particular reason that the two of us can’t be friends?”

“No,” I replied. My eyes involuntarily went to her bow, the first real magic item I’d seen thus far (if I didn’t count the void weapons). I wondered how often she could fire that volley of arrows and how dead I would be if I got hit by it. My guess was very dead. “Look, to be honest with you … I came
here by way of the plane.”

She raised an eyebrow at that and gave me a low whistle, then glanced at the zombies that were making their way toward us. “And your friend too?” she asked.

“Yeah,” I replied, because I didn’t really think that was the sort of thing that I could plausibly hide.

“Well then,” said the half-elf, still watching the zombies. She held out her hand to me. “Name’s Fenn Greenglass.”

“Juniper Smith,” I replied, shaking her hand. I was fairly sure that there were no records anywhere in the world that would back me up on having that name.

She turned to me and smiled. “Well Mr. Human, if you’re amenable, traveling alone in Silmar City is pretty much the most insanely dangerous thing a person can do, so I’d like to introduce you to my party, and you can travel with us, at least until you find your friend. No obligation, but it’s safer for all of us.”

Shit. I still didn’t trust her. “I was planning on going to Sorian’s Castle,” I said. I didn’t trust her, but being cagey wasn’t getting me anywhere.

“Fine by me,” Fenn said with a shrug. “I’ll see if I can talk the others into it, but we’ve ventured in there once or twice before. And if not, then maybe one of them has seen your friend.”
“So what would you have done if one of the umbral undead came after you?” asked Fenn as we walked back toward where her party was apparently waiting.

“I can outrun them pretty easily,” I said. “Same as you.”

“The big ones, sure,” she replied. “But they can spawn little ones, made up of fewer bodies but more perfectly crafted, and those not even I can outrun, which means that you’d have no chance. I’m assuming that you haven’t encountered one, because if you had you’d know your plan was basically suicidal.”

I shrugged. “It’s not like I have a lot of options.”

“True, true,” said Fenn. “Of course, option one, which most people who get the drop choose, is not to go to Silmar City. The deal with the Host isn’t a bad one, if you can make it to them.”

“Sure,” I said.

“So you came here by mistake then?” asked Fenn.

I didn’t have a reply to that, so I kept my mouth shut.

“Look, I don’t mean to scare you off, but the people I’m keeping company with on this fine day are going to want some answer, any answer, and telling them you were bumbling around isn’t going to cut it,” she said in a soft voice. “You don’t have to come right out with whatever the truth is, though obviously that would be preferable, but you might say something like, oh, I don’t know, you came to Silmar City because you thought it would have things worth taking, things that you could use to make a sure escape.”

“The planes have been dropping people for years,” I said. “A relative of mine told me that the graduation rates had been falling for years, because everything had already been picked through. So … we came here, because this is the place that no one goes.”

“Oh, well, that wasn’t convincing in the slightest,” said Fenn. “And not just because I knew that you were lying.”

“Is there a reason you’re helping me?” I asked. If you are. “Not that I mind.”

“A demon told me to,” replied Fenn in a cheerful voice.

“A … demon?” I asked. I was trying my best not to say anything that would give me away as completely clueless about Aerab, but Fenn was making it difficult. I would have naturally assumed that demons were a part of this world, but for someone to be open about a demon giving them instructions seemed like a fairly major thing that I’d missed thus far.

“Isn’t that the human saying?” asked Fenn. “When you do something you ought not do, you say that a demon told you?”

“Oh,” I said. “The imp of the perverse?”

“Ah, that’s the one,” said Fenn. “I knew I was close. We’re just about where I left the others, let me do the talking.”
We rounded a corner (given the odd angles of the streets, Silmar City was almost entirely composed of corners) and came across three men and a woman standing around. They came to attention as soon as they saw us, with hands going to weapons and postures shifting into defensive stances. They let up only a little when Fenn called out to them.

The fastest way that I can describe those four was that they were a pretty classic adventuring party. There was a big guy, nearly seven feet tall by my guess, covered from head to toe in thick full plate armor, holding a massive shield he’d scooped up from the ground when he’d seen us and a pistol three times bigger than mine, which was finely machined; he was the tank. Beside him was a rat-like creature with quills coming from his head, which I guess made him more of a porcupine, dressed in robes and with his hand resting on the grip of what I judged to be a katana; he was their damage dealer. The other two I judged to be mages of some kind, both human (and yes, it occurred to me that I was in a place in my life where I was referring to people by their species); the woman wore tight-fitting red robes with bones strapped to her in bandoliers, while the bald man was nearly naked and covered in tattoos. Had Amaryllis mentioned bone magi? And the last words I’d read before I’d run from the bookshop had been ‘tattoo magic’.

And in addition to being pretty close to what I thought of as a typical adventuring party, it didn’t escape my attention that their composition matched what Amaryllis had described as the ideal strike force: five people, casters of various flavors, a brute, a blade … Fenn was the odd one out, but if I’d had any faith in her statement that she was a simple looter, that was out the window now. Unless this is just what simple looters are like in this world, in which case I am fucked.

“I found a friend!” called Fenn. “I was just telling him how we’re all looters.” That was the most obvious form of ‘I’m giving you the story I gave him so don’t contradict it’ that I had ever heard, so obvious that I assumed I was just meant to treat the looting story as a polite mind-your-own-business type of fiction.

“You have made many missteps today,” said the porcupine samurai. “Do not leave us again. And we are not in the business of picking up strays.”

“Sorry Juniper, he’s very rude,” Fenn said to me. “Quills, Juniper has lost his friend and I was hoping that we could help him. The more the merrier, right?”

“No,” said Quills (a name that I wasn’t going to risk calling him, not until I’d heard it from his own rodent-like lips), “We are here with a purpose, one which is the business of no one else.”

“Oh, well, if you put it like that,” replied Fenn with a roll of her eyes. “Juniper here fell out of a plane, and his friend did too. Does that change your opinion on the matter?” As an aside to me, she said, “Quills takes an interest in people falling from planes.”

Quills looked at me. “Describe your friend.”

“Uh, he has short blonde hair and a weak build,” I said. “Last I saw, he had a rifle on his back, but he might have lost it when we got separated from each other.”

Skill increased: Deception lvl 6! (Further skill gains from telling lies are capped by joint primary stat POI.)

“You are just the most atrocious liar I have ever met in my entire life,” said Fenn. She rested a hand on my shoulder, which I resisted the urge to shrug off. “And I was raised by wood elves. Look, you can tell us the truth, you’re not going to get in any more trouble than you’re already in.”

“I’m in trouble then?” I asked.
“You’re in the heart of an exclusion zone,” rumbled the man in armor. His helmet concealed his face and muffled his voice.

“Oh, I didn’t mean it like you’re an errant schoolboy,” said Fenn. “I’ve certainly never thought of myself as a schoolmarm. In point of fact though, you’re looking for your friend and we might be able to help, but we can’t help if we have no description from you, can we?”

“Red hair, pale blue eyes, a maiden, but with purpose to her,” said the bone mage. Her fingers trailed over the bones strapped to her. “Intelligent, resourceful, daring.”

“Well, that’s more of a description than anyone gave me,” said Fenn with a huff. She turned to me. “Does that sound like your friend? There are, I gather, a few questions that Quills would like to ask her.”

“Fenn, silence,” said Quills. “Juniper, how did you come by an acquaintance with this young girl? That question should be harmless enough for you to answer and might lead us down productive avenues of conversation.”

The eyes of the tattoo mage glowed brightly, literally glowed with yellow light, then burnt out with a fizzing sound as a small tattoo on his chest faded. “We need to move,” he said calmly.

“Where are we going?” Quills asked Fenn. She twirled her finger in the air and pointed down one of the streets, then without saying anything started jogging in that direction. The others began following her, except for Quills, who stayed with me. “You’re coming with while we relocate,” he said.

I didn’t ask what would happen if I didn’t, mostly because I didn’t want to cement my place as their prisoner, and instead just jogged on after everyone else. Quill stayed behind me as we ran. I figured I was just about one sword stroke from a messy death, depending on how much he thought he needed me.

We regrouped in a burnt out shop, which smelled heavily of ash. I was mildly surprised that the whole city hadn’t been burnt to the ground in the absence of human intervention, but the walls seemed thicker in this place than I was used to on Earth, made with heavy stone rather than wood and drywall.

“It’s safe here?” asked Quills. “You’re certain?”

“For now,” shrugged Fenn. “You know I’m only a half-elf, right?”

“Give us a perimeter,” Quills said to the tattoo mage.

“I have six left,” he replied.

“Understood,” nodded Quills. When the tattoo mage left, Quills turned back to me. “How do you know this girl?” he asked. His eyes were watching me, and I was looking him over, trying to read him like he was so obviously reading me, but he was a freaking anthropomorphic porcupine and that was far too distracting. “Did you meet on the plane? No, you would have been bound and gagged. You met after you were on the ground?”

“Yes,” I said, to save me the shame of being read like a book. I wasn’t good enough at lying, not yet, and I apparently wasn’t going to get better anytime soon, not if the message about skill caps was to be believed. “She gave me a fake name, Cypress, but she had a plan for us to get out. The Fuchsia Coterie was there, killing people, and I didn’t have better options.”

“The Color Riot is involved?” asked the bone mage. She sighed at Quills. “This mission is getting
increasingly fucked.” Her hands went to her bones again, touching them one by one. “We have a mission outline, and a good one, with the tools we need to accomplish it. We’re saddled with,” she waved in Fenn’s direction, “but that’s a calculation that probably would have worked out, had we not been diverted in mid-stream to this other fucking mess. This isn’t any way to run missions. If you have two objectives that need to be accomplished, you don’t just spread a below-strength team thin and hope they can do both, you prioritize and pick the one that might actually be accomplished.”

“Are you done?” asked Quills. The bone mage nodded. “First, you’re saying too much in front of our guest, who need not be burdened by petty smugglers’ squabbles. Second, our focus was shifted from one task to the other, which we are, I agree, relatively ill-equipped for, specifically because it is one which should be easier, and more importantly, is very much time critical. Third, the tasks interrelate with one another. She knows where it is.”

“And how does she know that?” asked Fenn. “Who the hells is this girl you’re after?”

“I would tell you, if you needed to know,” said Quills.

I kept my mouth shut. I had told him that Amaryllis gave me a fake name, and he had apparently bought that bit of truthful deceit. I felt like I should level up just from that. How famous was she, anyway, if Poul was able to recognize her on sight? Why was she famous, if there were literally hundreds of other princes and princess? It would be like someone recognizing, I don’t know, a state senator or something. This wasn’t one of those academic “I wonder why the world is the way it is” questions that I sometimes got stuck on, I legitimately needed to know this in order to know how I should behave around these people.

“Where was she going?” Quills asked me, which was on the long list of questions that I didn’t want to answer.

“Sorian’s Castle,” I said. I paused for a moment, trying to think of what I could say that wouldn’t expose me as dream-skewered, be incredibly stupid, or otherwise jeopardize my life. “What are you going to do with her, when you find her?” Questions seemed safe, and so far Quills hadn’t treated me like I was undeserving of answers.

“He’d tell you, if you needed to know,” said Fenn with more than a trace of bitterness in her voice.

“Fenn oversteps her bounds,” said Quills, “It is one of the worst habits she’s displayed thus far, among many. Cypress, as you call her, will be debriefed and then released.”

Ah, so they are going to kill her. Because if they weren’t going to kill her, why wouldn’t he just say that they were taking her back to civilization? Wait, the magic number for teleportation is five, which means that if they were taking her back, one of them would have to stay behind. Presumably there are some limits on these teleportation keys so that having one doesn’t let you just dump as many people as you want, because Amaryllis treated it like a sensible limit to unit size.

“But you’re taking the teleportation key?” I asked. I registered surprise from Quills and the others. “She told me about it, that’s why I agreed to come to the city. That key was meant to be our way out. It’s your primary mission, but you don’t know exactly where it is, which is at least part of why you want her.” I hoped that I wasn’t saying too much. There was at least some value in seeming dumb and ignorant, but I wasn’t sure what their training or mission objectives said about people who had outlived their usefulness. “I can help you,” I continued on. “I traveled with her for two days, I know how she operates, what tricks she’s likely to use. We really did become friends. I can talk to her, help convince her to give you what you want, if she’s not naturally inclined toward that.”

“And your price?” asked Quills. “The keys can move five, and we can’t come back for you.”
“Protection while we travel,” I said. “A weapon, maybe, if you can spare one when you go.” I looked to the two mages. “Magic to improve my chances of getting out of the Risen Lands.”

Quills looked me over. “We’ll require your weapon,” he said. “And Leonold will bind you. Otherwise, I accept your offer.”

The tattoo mage stepped forward and reached out a hand toward me. Up close, I could see the tattoos moving across his bare chest, very slowly but still moving, wriggling like living things. There were a few landscape scenes, but otherwise the tattoos were mostly creatures, items, and complex patterns. There was a tattoo that wrapped around the palm and back of his outstretched hand, showing spikes, and this one was rotating, moving faster than any of the others.

“It’s important that you not resist,” he said.

I took his hand, and he gripped me tight. The spiked tattoo touched me, feeling like cold metal on my flesh, and then I saw it appear on the back of my own hand, spinning across my skin.

Unlocked skill: Skin Magic!

Achievement Unlocked: Skin Deep

It didn’t stay there though; instead it migrated up my arm, like a chilly bracelet, disappearing beneath my jacket. I could feel it moving though, past my elbow, tickling my shoulder, and then finally wrapping itself around my neck.

Quest Accepted: Heading Off the Skin Mage - Leonold has placed the Fool’s Choker around your neck. Disable it, kill him, or circumvent it before he kills you.

“I’ve never been in contact with skin magic,” I said slowly.

Leonold raised an eyebrow. “I appreciate the respect,” he said with a nod. “But you’re mistaken. I could still feel the burnt out rune on your right hand.”

Right, from the airplane. Did that not trigger an unlock because it was part of the opening scene? I touched my neck, where I could still feel a faint line of cold. “And what does this do?” I asked.

“If I activate it, which takes but a thought, it will cut about half an inch into your flesh,” he said calmly. “You are familiar with the location of your carotid artery?”

“Purely as a precaution,” Quills said quickly. “When we leave, it will fade from you.”

I nodded at that, trying not to feel too panicked by the thought-activated noose around my neck.

“I’ll take charge of the boy,” said Fenn. “Teach him the ins and outs, as it were. I do this as a service to you, most noble porcine.”

“Porcine means pig,” Quills replied mildly. “But I’m sure that your famously haphazard upbringing has once again caused you to innocently botch the common tongue. We’re going to Sorian’s Castle. What can you tell us that’s of use?” he asked her.

“The corporate castles are death traps,” said Fenn. “Funny enough, they weren’t designed with the living suddenly becoming the undead in mind. There were a few hundred people living in each of them. When the buildings lost power, they switched to a backup, and when that backup eventually failed, all the doors opened, as a fire safety measure. Well, that meant that the undead were free to roam, but their stochastic motion meant that they all ended up in the same spots, and since they all
lived and worked together, unanimity-of-purpose is higher, which means more umbral undead than you might otherwise expect from a highly populated area.” She shrugged. “Other than that, it’s your typical case of close quarters combat against enemies who can only be killed through precision or overwhelming firepower, plus it’s within the stalking grounds of the Biggun, whose entire existence is devoted to killing interlopers. So I believe the human term would be ‘cakewalk’?”

The bone mage swore and clutched at one of the bones by her chest, as though getting ready to throw it against the wall. “This is idiocy, Quills,” she said.

“Your opinion has been duly noted, Tova,” said Quills, which was apparently his actual name. “We knew that this was going to be difficult.”

“Difficult,” spat the bone mage. “Not suicidal. And we were supposed to have better intel.”

“We were,” nodded Quills. “It is my understanding that the political situation in the capital is more unstable than we’d known, and certain plans that this mission was contingent upon have failed entirely. This leaves us in an admittedly awkward situation.”

“Alright,” grumbled the tall man in armor. “I will ask the question I believe is on all our minds. The intent was that we would procure the teleportation key and use it to leave. In the event of abject mission failure, we were meant to radio for evacuation.” There followed a brief silence from beneath his helmet. “Were you to declare this mission a failure, do you currently believe that evacuation would be forthcoming?”

Quills’ nose twitched slightly. “The parameters for mission failure --”

“Just answer the damned question,” said Leonold, the tattoo mage.

“I’ve heard nothing explicit to that effect, but I believe we’re on our own,” said Quills. “It might be different if our second objective were achieved.”

Everyone seemed upset with that, save for Fenn, who was holding back a smile. She caught my look, shrugged, and grinned at me.

“To Sorian’s Castle!” she said. “May we succeed on our merits or die in ignominy.”

“There would be no ignominy,” said Quills quietly. “This mission would be buried under so many layers of classification that our names would never see the light of day.”
The tattoo mage’s eyes burnt out again not long after that, so we got moving, following Fenn’s
guidance and this time making our way to Sorian’s Castle, which we weren’t too far from. I’d
already seen it on the map, and it wasn’t too much larger than I was prepared for, which is to say that
it was incredibly large and worthy of being called a city within a city. The walls were high and had
arrow slits starting at the second level, with everything below that being solid stone wall. This struck
me as being particularly idiotic, given that sightlines in the middle of the city were basically crap and
a siege of this place wouldn’t be worthy of the name, not unless there were considerations that I
wasn’t aware of (which was entirely possible).

I was still feeling out of my depth, naturally, but more than that, I was feeling like I was no longer in
a game. A party of characters with their own strengths and weaknesses, trapped behind enemy lines
with only their skills to survive and the only path forward through an area of danger … well, that
was well-worn territory. The problem was, I wasn’t actually a part of it. If this had been a game, then
I would have been an NPC that the players had captured in order to wring some use out of him, and I
had DMed that situation more than enough times to know how that went. I’d been stripped of agency
by virtue of being in a position where agency would get me killed, not just because of what I was
assuming was an overwhelming disparity in terms of gear, knowledge, and training, but because I
had a tattoo around my neck that the game had practically told me would kill me sooner rather than
later.

I wasn’t even sure that they were the bad guys, where “bad guys” was defined as “aligned against
Amaryllis”. I didn’t know whether Amaryllis was a good person or not, so calling the people trying
to kill her bad was probably too much of a stretch, given the information available. More likely than
not, if this world had parallels with the ones I’d created for D&D campaigns, there were layers of
gray on one side and pitch black darkness on the other.

So things were stacked against me. On my side, I had: (1) Amaryllis was probably still out there
somewhere and would probably give me aid if she could … probably. (2) Fenn was clearly a part of
this mission under duress or coercion of a nature TBD, which could probably be leveraged. (3)
Everyone except for Quills showed some dissatisfaction with this mission and the way it was being
handled at the top, wherever that was, and they weren’t likely to turn on each other, but infighting
was a useful distraction. (4) They had taken my void tunneler but not my sword, which probably
meant it was useless or at least ineffective in terms of hurting them. That was probably true if the skin
mage could cut my throat with a thought. It still seemed like a classic case of underestimation to me
though. (5) I had the game elements, like the ability to level up and heal all my wounds, plus my
ability to learn things far faster than should have been possible, plus hints and clues that the game
incidentally fed me.

It was that last aspect I started work on as we moved around Sorian’s Castle. Taking on the tattoo
had unlocked Skin Magic, which meant that I had the very beginnings of the abilities that Leonold
had shown. I knew no spells, but I did have a piece of magic touching, or maybe buried into, my
flesh.

(Now you might be saying to yourself, “Juniper, prodding at the kill-you necklace is a bad idea” and
I would normally have agreed, but the quest I had been given specifically said that I could
circumvent it. And yes, listening to the text messages inside my head was also not good standard
operating procedure.)

The cold feeling was only there when I thought about it. If I paid close attention, I could feel the
exact boundaries of it, the peaks and valleys of the spikes. That sense went far beyond my body’s natural ability to feel heat and cold. I pushed against the feeling, slowly, trying to imagine that I was moving the opposite direction across the same channel of communication.

**Skill increased: Skin Magic lvl 1!**

I’ll have to say, that surprised me. The tattoo hadn’t moved at all, but my sense of it instantly sharpened. I pushed against the tattoo again, slightly harder. It had traveled along my arm to reach my neck, and if its function was tied to its location, which I desperately hoped it was, then moving it down to a finger would make a half-inch cut result in nothing more than a severing. Leonold hadn’t checked whether I was a skin mage before he’d bound me, which I hoped was another instance of underestimation that would give me wiggle room.

I’d gained two more levels in Skin Magic before we reached the front entrance of Sorian’s Castle, and was no closer to having moved the tattoo. I’d also gained a level of Deception as well, which was quite unexpected considering the earlier message I’d got. Was it because I was trying to surreptitiously work at the skin magic without anyone noticing?

The front of Sorian’s Castle was a massive portcullis that rose up almost twenty feet. It was down, but a corner of it had been bent outward, enough that you could have comfortably driven a van through it. Beyond that there was a courtyard, and only then did I see the glass frontage that I expected from a skyscraper, even if it was hidden in a cove and most of the glass was broken. Light was coming in from the third floor of the castle, which seemed to consist mostly of pillars rather than walls, at least from where I was standing.

“No undead,” muttered Quill.

Fenn stepped forward, coming up next to me. She casually slipped her arm into mine and leaned against me, holding her longbow with her other hand. “That’s not terribly unusual,” she said. “They’re not exactly patrolling creatures, and if someone had come by any, that were standing near the entrance would have been drawn out. If someone had gone running past, even past lesser umbrals, they would have been drawn inside.”

As she spoke, she was squeezing my arm. A short squeeze, two long squeezes, a pause, two short squeezes … it went on like that, and I recognized it as likely being Morse code, but I had no idea what message she was trying to spell out. I looked at her as she spoke, and on a final squeeze she gave me a pleasant grin, which I met with a puzzled stare.

Fenn sighed. “There’s nothing for it but for us to go in. I’m getting the sense that we shouldn’t stay out here much longer.”

“Then we move, slowly and carefully,” said Quills. “I will take lead, Tova will be in the back with Leonold. Fenn, stay beside Juniper and be ready to unleash artillery on my command. Juniper, we will make no special effort to protect you.” He rested a clawed hand on the tall armored man. “Carter, I wish you luck.”

But before we could start moving, a wave of corpses came around the corner, eerily silent as it set down one of many limbs, carefully placed so that it avoided cars and lampposts. It was almost two blocks away from us, but my heart was hammering in my chest. This thing was only vaguely shaped like a creature. The arrangement of the dead within it had suggestions of arms and legs, and the eyes were so blindingly bright that I had to force myself to keep looking in its direction.

“Move now,” called Quills, running even as he spoke the word. The Biggun reared back one of its arms, using so many of the dead that there was no clear point of articulation, leaving the limb it
showed looking more like a tendril. It snapped that tendril forward at startling speed, back and forth, each time sending a body flying through the air at us at startling speed.

Quills drew his sword and cut through one without breaking stride, giving me my first look at his long, thin katana, diverting both halves of it to their side of him. Another corpse hit the big man, Carter, right in his immense shield, but he took it without so much as a grunt of effort. Others slammed into the ground, splattering flesh and viscera and shattering bones. It was only because I was paralyzed with indecision that I saw one of the hurtling corpses smash into Leonold, hitting the completely unarmored man hard enough that his head should have snapped back or been sheared off - but it didn’t even move him, not a bit. It was Carter who jerked back with the hit instead. Linked through the soul to take the hits himself, those had been Amaryllis’ words.

I finally came to my senses and ran. I was at the back of the pack by quite some distance, which gave me the marginal benefit of not being where the majority of corpse-fire was landing. Quills cut several bodies down in midair, sometimes stopping his forward motion in anticipation of them so he could protect the others. Carter moved faster than I’d thought a man in thick full plate could, even accounting for everything I’d read that debunked full plate being restrictive. The two mages took a few marginal hits when pieces of bodies flew like shrapnel, and I saw those hits reflected on Carter in sudden, awkward movements of his body. Fenn … Fenn didn’t seem to be dodging really, in the sense that she was watching the incoming corpse-fire and reacting to it, but she always seemed to be where the body parts weren’t.

I drew my sword as I ran, trying to watch for a body flying through the air toward me as quickly as a speeding car. When one came, I dropped into a quick roll across the street, hoping that I wasn’t putting myself in exactly the position to take a hit.

**Skill increased: Dodge lvl 2!**

And then I was on the move again, still bringing up the rear as the others reached the broken portcullis. That at least would give us some cover from the corpse-fire, though if the interior of Sorian’s Castle was infested with zombies we were going straight into a pincer. An errant corpse smashed into a car right next to me and its top half went spinning toward me. I lifted my sword and caught it in the ribs, which was enough to arrest its motion.

**Skill increased: Parry lvl 2!**

The zombie was still living, I realized, or at least undead, because its eyes were glowing and it was moving. I let it slide off my sword as I hurried forward, now further behind than before.

“Artillery!” shouted Quills as I made it through the portcullis. We had company up ahead, three of the Zombie Voltrons and one of the smaller, sleeker versions, all of them bounding toward us from out of the ruined glass frontage, into the courtyard.

Fenn drew her bow, closed one eye and squinted, then released. Her arrow once again split in the air, first into two, then four, then eight, until it was a full volley ripping through the undead. Two of the Voltrons collapsed, but the third she didn’t hit, and the slender, ten-corpse zombie had rolled itself behind one of the ones penetrated by arrows. Errant arrows, of which there were many, crashed into the building behind the zombies.

Quills kept up his speed and ran straight toward the Zombie Voltron with his sword trailing behind him. When he reached it, he spun with sword outstretched, cutting a thin line right through it that caused pieces of it to drop to the ground. When it swung its arm-like appendage at him, he sliced straight through that too, and then followed it up with another cut to the creature’s nominal leg which caused it to slide down into a red-eyed pile.
Tova and Leonold took on the smaller one, her with bones in hand, striking at it with impossible speed and punches that I could hear crack bones, him with his skin aglow in colors. It was hitting them hard with its many arms and legs, until they had struck through enough of its hearts that it collapsed into pieces.

“Run!” screamed Fenn as she followed her own advice, disappearing into the castle’s lobby. Unlike the others, I had never stopped, and I weaved through the fighting, looking behind me only briefly to confirm what I suspected, which was that the Biggun had made its way down the street to the portcullis. It was releasing parts of itself, small blobs in relation to its size, but recognizable as one of the fast conglomerations, well capable of running us down.

We ran. There were more zombies inside, but Quills had a sword which was apparently capable of cutting through anything, and none of them were the dangerous, stuck-together sort. We raced up a central staircase in near-darkness, with the big brute, Carter, nearly falling behind, then up another staircase, then a third, until we were on the fourth level.

“Leo, time out,” shouted Quills.

The tattoo mage stopped right where he was and held out his hand, then ran in a small circle not more than ten feet wide with his hand trailing behind him. It started with a blue glow in his hand that built as he went, until his entire arm was covered in vibrant blue light. It was just before he finished that I realized everyone else was inside the circle and I was outside it; I took a step forward and Fenn reached out to pull me in, right as the circle closed and everything went black.

I felt the pulse of my blood, which was racing, and lit my finger on fire, which illuminated the six of us standing around, the floor we were standing on, and nothing at all beyond the circle that Leonold had traced.

“You’re burning our oxygen, asshole,” said Tova. Her hair was in disarray and a number of bones were missing from her bandoliers.

“Blood magic doesn’t oxidize, not unless he sets something on fire,” said Quills. “It’s the best light source I think we have. Small mercies.” To my surprise, he gave me a short bow. “Leonold, what does spell integrity look like?”

“It was a sloppy cast,” the tattoo mage replied. “We’re also sitting at six, not five, which cuts down our time. Figure an hour and a half until we’re not in fighting shape when we get out.”

“And where the fuck is that?” asked Fenn. “Seems like nowhere to me.” Her hand moved to the blackness around us, but Quills slapped her away.

“We’re outside of time,” said Quills. “Don’t touch the border unless you want to lose a finger. Carter, status?”

Carter finally removed his helmet for the first time since I’d seen him. He was hairless and his skin was blue; one of the kashoonk, if I remembered the races I’d created correctly. His face was bloody and bruised, and one of his eyes was swollen shut and leaking a white fluid. “Broken wrist, broken ribs, broken face, broke all the fingers of my left hand, bruised from head to toe, feeling like a raw piece of meat. I’m going to need half Tova’s healing just to keep me going.”

“Make it so,” replied Quills. Carter immediately set to work removing his armor, which was awkward for all of us because there wasn’t quite enough space for six people. Tova grabbed bones out of her bandoliers, looking them over and setting some aside. While they did that, Quills turned to me. “We are here largely on your word,” he said. “Is there anything you have held back? Any hint as
to where she was going within the castle?”

I tried to steady my breath. I was breathing up their air and my usefulness was rapidly diminishing. Knowing a little bit about Amaryllis wasn’t going to help if we didn’t run into her, and I couldn’t imagine how she would possibly have gotten past what had greeted us in the courtyard. I had few pieces of information to parcel out and when they were gone, I was probably dead. If I held them close to my chest, I was also probably dead.

“I don’t know what you know,” I replied. “She said that there was a secret facility on the twenty-first floor.” Though the game said that it was on the top floor, and I’m not sure that’s the same thing. “The facility was meant to study the necrotic field effect, but they … lost contact, or something, taking their key with them.”

Quills shifted his nose from side to side. “She actually trusted you then.”

I nodded. “Maybe not wisely.” I wanted to let the fire on my fingertips wink out and hide. I had done the same thing she’d done when she left me for dead: I had made a calculation, and she had come out on the wrong side. It still made me feel like shit though.

“So who the hell is our mystery girl? Who gets marooned in the Risen Lands and knows everything there is to know about secret research facilities that violate the exclusion zone?” asked Fenn. She maneuvered in the tight space until she was next to me. Her hand rested on my shoulder as she looked to Quills.

“Amaryllis Penndraig, Princess of Anglecynn, Special Liaison on Existential Emergencies,” I replied. I was fairly sure that Fenn was the only one who didn’t know that, and now, at least, I could get some information from Quills.

“Oh,” said Fenn. “Well, fuck.” Her eyes momentarily went to Leonold, then to me, then down to the tattoo around my neck. She turned back to Quills. “So, you just want to have a friendly chat with this girl, most senior of the Penndraig line, before sending her on her merry way to die in the middle of Silmar City? Because it seems to me like either we’re meant to kill her, or you’re meant to take her out of here, and if it’s the latter, then that’s probably bad news for the least valued member of the team.” She tousled my hair with the hand that had been holding her bow upright, then caught the bow just before it tipped over and fell. “No offense to our stray, who would take that title if only he were a member.”

Quills’ hand was still wrapped around the grip of his blade, which he had not yet sheathed. “It is of no concern,” he said. “We will not find her. This mission has been reduced to our mere survival.”

I wasn’t willing to press the question, and to my surprise Fenn didn’t seem to be willing to either. She instead turned and kissed me on the cheek, then with a languid motion fell to the floor and assumed a sitting position.

Skill increased: Romance lvl 2!

“You’ll stay with us, for now,” Quills said to me. “I am blade-bound; our oath is our word. But the caution you received, that we would make no special effort to keep you alive, that is also true.” With that he turned away from me, sat down, and began cleaning his blade.

Tova was still working on Carter, holding a bone in one hand until it smoked while touching his bare flesh with her other hand. The healing wasn’t complete; his wounds got better, but his flesh didn’t become unblemished. When she had burnt through one bone, she tossed it aside and selected another, moving over his body (now bare save for a pair of briefs) delicately and occasionally asking
soft questions he answered with monosyllables.

Leonold was tattooing himself by the light of my flame, using a small pot of ink and a needle. He grit his teeth as he did it, but made no sound. This was apparently part of the process for a skin mage, or a tattoo mage. I didn’t know whether that was a difference in terminology or a real difference in praxis, but I didn’t want to interrupt the man who had magic wrapped around my neck.

So having nothing better to do, I sat down next to Fenn.

“I suppose you’re wondering why I kissed you,” she asked.

“Not particularly,” I replied. “I thought that was just … your way of trying to get under my skin. Or Quills’.” I kept my voice low, but the space outside of time we were in was quite small, and Carter was taking up a lot of it.

“You’re cute,” said Fenn. She kept her own voice low to match mine. “Not what you just said, that was borderline offensive, but in general appearance and mannerisms. There’s something very human about you, has anyone ever told you that?”

“No,” I replied. “But … I’m not very worldly.”

“Well,” said Fenn. She scooted closer to me, until she was pressed up against me, and placed her head on my shoulder. I was hyperaware of the feeling of her pointed ear touching me. “Perhaps that’s what I mean when I say that you’re very human.”

“Don’t play with your food,” said Leonold from across the room.

“I’m only half-elf,” replied Fenn, not raising her head from my shoulder. “I have consumed very few people in my days.” She shifted slightly, then sat up and looked at me. “There’s something very cozy about being close to death, isn’t there? Something about wolves howling outside the door that sends an electricity through people? Or is that just my elf side speaking?”

She moved her head in close and used her nose to push my face to the side, then kissed me on the cheek. I let it happen. I was feeling exhausted, not so much physically but mentally, probably the result of having so much to process in so little time and the stress of looming death. It felt nice, but I was too wrung out to experience any real sensuality. She leaned forward more and brushed her lips against my ear.

“They’re going to kill us both,” she whispered, just loud enough so that I could hear it. She pulled back, brushing her cheek against mine, and then looked at me straight on. There was nothing playful or seductive about those dark green eyes. The look on her face was meant only for me; she had positioned herself to be unseen by the others. I wasn’t terribly good at reading people, not enough for me to decipher her microexpressions, but the sheer intensity of it alone was frightening.

“Of course, there’s much written on the subject of pre-battle coitus,” Fenn said aloud as she turned back to face the others. “Some are of the opinion that it saps men of their fighting spirit, while others feel that it calms the mind. Myself, I think there’s something to the notion that a little teasing can spurn a man onward to greatness.” She let out a sigh and disengaged from me entirely, so that we were only sitting next to each other. “So, you say that you’re not worldly. Is this your first time seeing a meatshield?” she gestured at Carter.

“I’ve … heard stories,” I said. “Never in person, no.” Was he literally called a meatshield? Was this world really that bizarre?

“He’s linked by the soul to the rest of the team and takes all the hits they would take,” said Fenn.
“Very funny stuff, really, because you could punch Tova in the head and Carter would be the one to feel it. Of course, he’s the one with all the armor, so likely you’d break your hand in the process, which I suppose is not all that funny, except to outside observers. And before you try anything, he wasn’t linked to me personally, because I am for some reason not trusted by these otherwise warm-hearted smugglers.”

“Enough talking,” said Tova. “And Juniper, more light for this part.” After a second she added. “Please.”

I flared the fire until it consumed my hand, and got a message that I had once again capped my skill for blood magic. I watched as Tova took the thickest bone still left in her bandolier and traced her fingers over Carter’s blue-skinned chest. This bone stunk worse than the others, filling our enclosed space with a lingering acrid smell. Halfway through, Carter grunted and arched his back, letting out a whimper as he collapsed back to the ground. When it was finished, Tova was breathing heavily.

“Healing is as done as it’s going to get,” said Tova. “I have about a fifth of my total reserves left,” she gestured to her bones. “Enough for a single fight, or critical healing in a time of need.”

Carter began putting his armor back on. I wondered how often he had been hurt for the sake of others, how often he had gone through similar healing processes in order to come back into the fight. It seemed rather masochistic to me.

But Fenn hadn’t told me about the link he shared with the others in the interests of satisfying my curiosity, she had said it because they were going to kill us both. She’d told me about Carter because if I wanted to live, I would need to deal with Leonold, and to do that, I would need to deal with Carter first. I wasn’t actually sure why either of us were alive, if Quills and company really were bad guys, but I trusted Fenn more than I trusted them. I wasn’t quite planning on killing Carter and Leonold in cold blood, but that was partly because I had no real ideas on how to do that.

“We need to plan,” said Quills, standing up swiftly. “We are currently on the fourth floor, with unnumbered undead ahead of us and unnumbered undead following behind us. There are seventeen stories between us and our objective. Tova, you are a non-combatant unless Carter dies, in which case you are to use every scrap of your remaining power as rearguard. Leonold … status?”

“The usual bits and bobs, but if we’re talking things of note, then two of Prince’s Invulnerability, five of the Pseudo Perimeter, which probably wouldn’t even work in here, one more Fool’s Choker, and a single Faltering Candelabra,” said Leonold, occasionally pointing to pieces on his skin.

I felt at my collar as he spoke, pushing again at the tattoo. I had finally managed to budge it at level eight of Skin Magic, but “budge” was on the order of centimeters rather than moving it away from my neck, and the levels were coming much slower now.

“Prince’s Invulnerability lasts for about six seconds?” I asked. “Covers six people?”

Leonold stared at me. “Yes,” he said. “How’d you know that?”

Well, you see, there’s this game called Dungeons and Dragons in a place that may or may not exist called Earth, and there are spells created by Gary Gygax and the Wizards of the Coast, but there are people called dungeon masters who can make up their own spells to give to wizards, and that one was one that I made up before I got here.

“I read it somewhere,” I said slowly.

“Where?” asked Leonold.
“It’s not important,” said Quills. “The headaches have started, that means time is short. Juniper, don’t speak again.”

I closed my mouth, even though an idea was forming. Prince’s Invulnerability had been a mistake, one of those spells that I’d thought was really cool when I’d handed it over but which tipped the game on its side. The problem wasn’t the mechanical aspect of preventing all damage, it was the shenanigans that allowed; in the very first session they had it, the party made a dramatic escape by putting on the invulnerability and then jumping from the parapets of a lich’s castle.

(Yes, this did involve a lot of arguing about whether real-world physics superseded D&D rules when D&D rules were stupid and unrealistic, plus consulting with online calculators that took into account drag coefficients, plus a smattering of jokes about the airspeed of an unladen swallow.)

“Fenn,” asked Quills. “How many artillery shots?”

“One,” she replied with a frown. “You call it and I’ll make it, but you had better pick well. Also, if we’re counting assets, then you should probably put my charms there as well. I have not yet tried to charm the undead, but we’ll call it a last-ditch effort, shall we?”

“I am more hoping that your luck assists us,” said Quills, paying no more attention to her than to give her a shake of the head. “Juniper, you have some access to blood magic, but can I assume that it’s limited?”

I literally learned everything I know earlier today. “It’s nothing more than a party favor,” I replied. “But …” I hesitated, unsure how to proceed. There was so much that I didn’t know about this world, and I couldn’t ask questions without looking like a fool, or worse, revealing that I had a mental disorder that you could find in whatever the local equivalent of the DSM-5 was. “We should take the elevators,” I said.

“It might have escaped your notice, hooman friend, but there’s no power,” said Fenn. “Easy to see how someone could overlook that.” But in spite of her snark, I was breathing a sigh of relief, because she’d just confirmed for me that the doors I briefly glimpsed at the lobby level were, in fact, the doors to elevators, and not only that, that these elevators required electrical power rather than running on some crazy system of gnostic runes.

“You want us to climb,” said Quills, shaking his head, “Worse than stairs, because our options will be too limited in the event they follow, and attack from above would send us falling to our deaths.”

“No,” I replied, starting to get that warm feeling of excitement at a plan that might actually work. “I want to launch us.”
Thank you for signing up for ELEVATOR facts!

The thing to know about modern elevators is that they have a lot of safety features.

1. There’s not a single cable that holds up the car, there are about eight, each of which is capable of holding up a fully loaded car all by itself.
2. The elevator car and counterweight it’s attached to are usually on tracks in order to provide friction in the event of a catastrophic failure.
3. The elevator car has safeties on it that activate if there’s what the manual would euphemistically call an “overspeed event”, or in other words, when the car is moving way faster than it should.
4. The pulley at the top of the elevator shaft is the thing that actually makes the elevator car and counterweight go up and down, and it has a governor on it that locks the pulley into place if there’s too much centrifugal force from an overspeed event.
5. At the bottom of the elevator shaft there’s usually some cushioning, not enough to always prevent injuries or deaths, but enough to add some margin of error.

That was about what I knew. Here’s where I would normally make some crack about how KNO 2 was bullshit, but my KNO was up to 4 at this point and I was honestly not sure that I would have been able to remember all that if I’d been asked a few days before. That was a sobering thought; it would be the first real indication that the game layer was actually monkeying around with my mind.

Anyway, here’s what I knew about the safety features of elevators in Aerb:

1. ???

(That’s overstating it a bit, since I was a big believer in convergence of designs, and therefore this world probably followed those rules as well, whether it had been created from an imprint of my mind or whether my dream of Earth was inspired by buried memories of Aerb. Even if there was no Elisha Otis to invent the elevator in Aerb, the principles of design would be largely the same, modulo anything that magic could do. Elevators had braking systems to prevent people from plummeting to their deaths, not because of anything specific to Earth. So far Aerb appeared to have what I would call physics plus, but what I had seen so far indicated that they didn’t have free energy, which meant that they needed to conserve energy, which meant that elevators would have counterweights to reduce the energy needed move cars around.)

Unfortunately, no one else knew all that much either, which meant that I was putting forward a plan that was at least partly based on ignorance. It was possible that there was a governor at the top of the elevator shaft that would trip through centrifugal force when the counterweight started moving down, and it was also possible that lack of electricity would simply lock both the elevator car and counterweight in place.

“Risk and reward,” murmured Quills after we’d discussed the idea some. “If it works, we skip past seventeen floors of hard fighting. If it fails … we’ll have spent resources that we can’t afford to spend. The undead will come at us and we’ll have to kill them, rather than just running away. Still, on balance … Leonold, the Prince’s Invulnerability will protect us?”

“Yes,” nodded Leonold. “It’s six seconds, no more, no less. If our ascent takes longer, I’ll have to activate it twice. And if our ascent fails, then we’ll be out a use.”
“Then I’m in favor,” said Quills. “We’ll move to the elevators, make a stand there, then hopefully get to the top and disembark from there. Fenn, we’re going to use your final artillery shot. Objections?”

Carter shifted uncomfortably, but neither he nor anyone else said anything. Personally, I was starting to more keenly feel the effects of the enclosed space; my headache had gotten sharper and I was sweating. I was fairly sure that I would have felt warm, had I not been keeping a fire going with my blood for the past hour.

And yet even when there was agreement about what we were doing, we stayed within the bubble of dilated time. (Do I need to point out that I was eager to learn how to do that? I mean I hope that you at the very least think of me as not being brain damaged, so yes, I wanted to learn how to put the game on pause.) One of the “bits and bobs” included in Leonold’s arsenal was 200 feet of rope, which he pulled from a tattoo on his wrist, and which he thereafter treated as though it were entirely real. This he did some crude knotwork with, because it was better to have that prepared while we were safe than while we had the zombies after us.

And then, after all the waiting, most of which I spent practicing moving my throat tattoo, we were suddenly ready to go. As everyone got into position within our small space, I could feel my heart beating quickly in my chest and my breathing grow faster. That might also have been from the carbon dioxide poisoning.

When the time dilation fell away there was a flash of light that left me blinking and a blast of air moving away from us. There was barely time to take in the scene we’d left behind before we were moving again, racing toward the elevators.

When we got there, Quills delivered three quick cuts to the elevator door, then Carter delivered a solid kick to the triangle of free-standing metal, which crashed inward and fell down four stories, because the elevator wasn’t waiting. I stuck my head in and flared up light from my hand, then breathed a sigh of relief. “Fourth one down!” I shouted, even though they were right next to me. That was failure point one behind us; there was an elevator on the right level for us to use.

We reached it just as three of the slick corpse menageries came crashing down the hallway. Quills called for artillery, and Fenn obliged, with her arrow again splitting in two every ten feet. We were in relatively close quarters though, which meant that the assault wasn’t quite as powerful by the time it reached its target, and only one of the things became a pincushion, falling apart and letting the other two through. Quills cut through the elevator door, then turned to meet them.

My own role was to help Leonold with the preparations, in part because I’d given them the impression that I wouldn’t be completely clueless about what we’d find up there, and in part because I could produce light to work with. I followed him into the elevator and then hoisted myself up through the grate that he’d opened.

Look, I’d never been on the top of an elevator car back on Earth, and had never seen the top of one except in movies, so when I say that what we found looked exactly Earth-like, you have to take it with a grain of salt. I’m sure that there were differences, but I’m not sure what they were. The car ran on tracks, there were more tracks for the counterweights, and eight cables went straight up beyond what we could see. Everything still seemed to be in fine shape, minus a small bit of dust that might have been there when this castle was active. That was pretty reasonable, given that this place had essentially been mothballed for an unknown number of years. At any rate, that was failure point two waving as it passed us by; the elevator looked how it needed to look for this plan to work.

“If you fuck this up, I’ll kill you,” Leonold whispered to me.

I nodded and tried to ignore my shaky hands as I helped him to prepare. The cables were bolted into
the frame of the car; we needed a way for us to be carried up with the ends as soon as someone, presumably Quills, cut them loose. To that end, we began weaving the rope through the cables, leaving the prepared lasso loops dangling out so that we could each slip into them. I was working one-handed, since my other hand held the flame, basically just being an extra hand for Leonold.

“Is this going to hold?” I asked him, even though that question had been gone over a few times while we were planning. The tattoo mage didn’t answer me. The rope he had wasn’t very strong, not even as strong as climbing rope, but it didn’t need to be that strong, especially if we were setting things up so that there was strain was distributed across many ropes.

“Good?” Quills shouted to us as we were finishing up.

“Close,” Leonold called down. “No problems.”

“Candelabra,” Quills shouted.

Leonold didn’t hesitate; he dropped down into the elevator and then cast a spell that I could only halfway see while I waited for him to come back. Only I wasn’t just waiting, I was working as hard as I could to move the Fool’s Choker around my neck. On Earth, the worst thing about having a full neck tattoo was that it was visible to everyone. On Aerb, that was the second worst thing, but it was still pretty bad, because it meant that even if I moved it, it would be immediately visible that I’d done so - unless, of course, I was in a dark elevator shaft and controlled the only source of light. It was slow work to shift its position, but I had finally felt that cold band of magical ink slip to the side, right as Leonold came back up. It was no longer a choker, more a ring sitting on my shoulder, and while I was sure it would still hurt, that was better than having a slit throat.

Leonold returned to his work, moving quickly. He hadn’t been looking at me at all before, and to my relief that continued as he did the last of the knotwork. I nevertheless positioned the light so that I would be as obscured as possible, and let it dim slightly. When he was finished, he slipped one of the loops over his head and arms until it was nestled in his armpits, then walked a half step away to draw the lasso tight. He leaned slightly, testing it.

“Good to go,” he shouted. To me, sotto voce, he said, “I shouldn’t have said I would kill you, that was just nerves talking. This mission … you don’t know the half of it. And now it’s down to this insanity.”

“S’okay,” I replied. I had a lump in my throat.

The others made their way up, first Fenn, then Tova, then Quills, and finally a battered and unsteady Carter lifting himself up while kicking at something below him.

“Hurry,” he said, just as the car was rocked by an impact. Leonold helped slip a loop around him and then supported his weight. From the grate, a single arm snaked up, its fingernails bent backward and falling out.

Quills made the first cut by the weak light of Aarde’s Touch, slicing through the roof of the elevator. So far as I could tell, either blade-bound had absurdly sharp and durable blades, or they found conventional physics to be terribly unexciting. When a second cut followed the first, metal began to creak, and when his third cut came, the elevator lurched down. The section of metal we were standing on was peeled back by the tension of the cables pulling at their mounts now. Quills drew a sharp breath and aimed his blade.

“Invulnerability on three,” said Quills. “One, two,” spears of golden light shot forward from a large tattoo that was now centered on Leonold’s chest, one of them going to each of us and connecting us
to him, then fading out. “Three,” said Quills, bringing his sword down.

I had thought that we would rise faster. In my head, we’d go soaring upward, like a coin launched from a slingshot, but while it wasn’t at all sedate, it was slow enough that I had time to count the floors. I had let the fire I was providing go out as soon as we started moving and was now holding onto two ropes, both Tova’s and my own, trying not to feel ill from the swaying feeling.

“Belay cast!” called Quills.

And then just like that, the six seconds were up, and we were still rising in darkness, only my nausea at the movement was compounded by the painful squeezing feeling around my chest. The ropes had drawn us all together, so that flesh was pressed to flesh, and I could feel Fenn’s hot breath as we continued up. I was still trying to count floors by the faint light that seeped in from elevator closed doors. We had, at any rate, sailed clear of failure three, because no pulley governor was engaging, and we were still on the rise.

“There’s this thing called the unspoken plan guarantee,” said Tiff. She had turned her chair to the side and was propping her feet up on Reimer’s chair, which he disliked but allowed. “Basically what it means is that if you hear people talk about a plan in a movie or novel or TV show, then that plan will fail, or if not fail, then run into some unforeseen complication.”

“I’m not sure I get it,” said Arthur. “We’re not bound by traditional narrative rules.”

“Yeah, I don’t get it either,” I said. “The unspoken plan guarantee exists because there’s no tension in hearing a plan and seeing it in action. In tabletop, the dice provide the tension.”

“The dice provide some tension,” replied Tiff. “But if the plan is good enough, then there’s the same problem, and we have someone at this table whose job it is, at least more than others, to make this whole shebang entertaining, and who also has the power to introduce complications ex nihilo.” She made a finger gun at me and mouthed a pew sound. I smiled and rolled my eyes.

“So you’re saying that we should keep things secret from the DM?” asked Reimer. “In my experience, that doesn’t work too well.”

“Oh, well not big secrets,” said Tiff. “We should keep little secrets, tiny things we hold in reserve that we agree not to mention out loud in the hopes that Joon forgets about them, or parts of the plan that can legitimately surprise him so he doesn’t feel the need to insert things into the game just to make it more interesting.”

“Seems a little adversarial,” replied Arthur. “In the tabletop-as-performance model … well, I guess there you could make the same argument, that the performance is better if there’s some aspect of hidden things being shown.”

“Or,” said Tom. “We could just not ever plan anything.” He tapped the side of his head. “If you have no plans, then you don’t have plans that need hiding.”

We were around the fifteenth floor when we reached failure point three point five. I was the only one who knew about it, hence the awkward numbering.

I listened to the beat of my heart and the rush of my pulse, then pushed heat into my closed fist, trying to watch closely to see how much light was given off. My grip on Tova’s rope was tight, and if I understood correctly the flame was nothing like an actual flame, so the visible light in the dark elevator shaft was basically nothing. I pushed more of the heat of my blood into my fist, then more,
then still more.

After the first second, the heat was uncomfortably hot, and after the second second, it was painful. I would say that it was unbearable, but I was bearing it, because I had to. And then, just as I was getting ready to cry out in pain because of the burns I was inflicting on my hand, the rope holding up Tova snapped and sent her screaming as she plummeted. The game messages came quickly after that.

*Skill increased: Deception lvl 8!*

*Inge Carter defeated!*

*Loyalty Increased: Fenn lvl 1!*

*Achievement Unlocked: Microhitler*

*Tova Feidlimid defeated!*

*Loyalty Increased: Fenn lvl 2!*

*New Virtue: Ruthless!*

I felt sick to my stomach as I read through those and blinked the messages away as soon as I saw them. Tova hadn’t fallen straight down, she had clanged hard against the side of the elevator shaft, probably hitting a girder or ledge. I wasn’t next to Carter, but I’d felt him jerk around and then start swinging. After that, I’d heard the clanking thud of her hitting bottom. Even without the game telling me so, I would have known that she was dead. Even if the fall had somehow not killed her, the zombies would have, so I had to at least be thankful that her death was a quick one. *Please, please be the sort of person who deserved that.*

And we were still rising, faster than before, almost to the top.

“*Invuln,*” said Quills, his voice hard.

Again the spears of light came out from Leonold, but this time they touched only three of us, Quills, Fenn and myself. It was enough illumination to see Quills quickly slice through Carter’s rope, letting him drop down below. Two seconds later, we went crashing into the top of the elevator shaft, pulled forward and around by the pulley, which finally gummed up with the cable mountings and metal plate hitting it at high speed. I landed in a crumple, with my torso and one leg on something made of metal and my arms out in the middle of nothingness. I still had a rope around my chest, but I had no idea what it was connected to.

When I suddenly started feeling things again, the pain in my burnt hand was almost crippling, so I stayed where I was, not daring to move.

“*Roll call,*” said Quills. His voice was calm and steady.

“I’m fine,” said Leonold.

“Peachy,” replied Fenn with a cough.

“Juniper?” asked Quills, as I tried to slow my breathing. I had known that the fire would hurt, but I hadn’t realized that it would hurt so much. Worse, I was absolutely sure that it would be clearly visible, leaving me caught red handed.
“Tova,” I said at a whisper. “She was right beside me.”

“Give us light,” said Quills.

I placed my hand down on the metal beneath me, tried not to hiss as the raw flesh touched it, then used my good hand to create a small flame. I saw Quills holding onto a strut, with his sword drawn, Leonold blindly clutching part of the gridwork that the pulley was attached to, and Fenn sitting casually on a walkway to the side.

“What happened?” asked Quills. I would have sighed in relief that the question was directed at Leonold instead of me, but my hand was getting more painful by the moment.

“There were too many failure points,” said Leonold through clenched teeth. “Eventually, we had to hit one.” And now I’m home free, until we step out into the light and they see my burnt hand and displaced tattoo. “I’d still like to check the ropes though.” Fuck.

I let the light from my hand dim further and flicker. “Not sure how long I can sustain this,” I said. “I’m already getting the shakes.” Most of that was because of the radiating pain of my burn. I did wonder how deep it had gone, what I would see if I looked at it. I’d put in enough heat to burn the rope, or at least damage its structure; what had that done to my hand?

“Post mortems are unimportant right now,” Quills said smoothly. Leonold gave me a suspicious look in the dim light, but my hand was held high and the shadow from my head mostly covered my neck. Quills stood up, sword in hand, heedless of the fact that he was balanced precariously over at least a twenty-story fall. He climbed his way down to the elevator door below us, standing on a thin ledge, and with four strokes of his blade cut a square hole in the door. The detached metal slid back and fell into the elevator shaft, tumbling down until it banged against the sides and made a racket.

“Oh the plus side, the upper floors should be relatively clear,” said Fenn. “They weren’t residential and the undead have more trouble going up than down, meaning that over the years many of them would have filtered into the lower levels through stochastic motion. All that’s left is to find the key and skedaddle.”

Leonold climbed down and out the door, following Quills, and Fenn followed after with catlike grace. I unlooped the rope from around myself, feeling the stinging pain in my hand as I briefly brushed it against the rope, then slowly, agonizingly, made my way over to the catwalk, and from there down a slender ladder that the others hadn’t even used, trying my best not to succumb to vertigo. My injured hand was cradled to my chest as I made the transition in, hoping that I could somehow talk my way out of what the injury implied.

But just as I stepped onto the floor I felt a sharp pain in my shoulder as the tattoo sliced into me, and then --

Leonold Pavran defeated!

Quest Complete: Heading Off the Skin Mage - Leonold Pavran tried to kill you as he died, but you managed to move the tattoo just in time.

Level up!

I was taken by the golden glow of raw power and wrapped in its warm embrace, the pain in my shoulder and hand instantly gone with no trace they’d ever been there. My mind was fuzzed with a feeling like pure, rapturous love that was gone as soon as the level up put me back down on my feet.
I’m pretty sure that Fenn and Quills would have been staring at me, if Leonold wasn’t lying on the ground with a dagger sticking in the side of his head. Instead, Quills had his sword drawn and was moving back from where he’d been toward Fenn.

Fenn ran, and Quills chased her. There were too many things going on for me to process it all, but we were in a sunlit reception area on the top floor of Sorian’s Castle, with a desk against one wall and a blue and yellow crest with a badger on it behind that. Fenn went to the nearest of the two doors out, pushing it open, and I firmly believe that she would have died then and there if the door had been locked. She had a bow, a magical one, but with no magic remaining, and he had a sword which could cut through practically anything.

I ran after them, not knowing what I could possibly do against Quills, not even if I managed to catch him off-guard. I came into the room, a wide open area with a dome nearly two hundred feet across and furniture that had been pushed to the sides, just after him. I almost bumped into him as he came to a stop and raised his sword, not at me, but at a familiar someone crouched down behind a makeshift barricade a hundred feet away.

Thunk.

A perfectly circular hole appeared in the thin blade Quills was holding and he grunted. I stared with mouth agape at Amaryllis, who was calmly crouched down with her rifle aimed down the length of the room, shielded by a thick wooden desk that had been tipped on its side. Quills cursed and did a tumbling roll to the side, coming to land behind a plush couch. Fenn was similarly hidden behind what looked like a piece of laboratory equipment, with an arrow nocked in her bow. She didn’t quite have an angle on Quills.

“Identify yourselves,” called Amaryllis. Her voice was raised to cover the distance between us.

“Brownsnout Quills-in-Hand,” said Quills. “Blade-bound leader of the now-former Fireteam Blackheart, pledged in service to the Kingdom of Anglecynn, long may it stand.”

“Fenn Greenglass,” replied Fenn. “I am technically a consultant to Fireteam Blackheart, but we’re having a very petty squabble right now with regards to some recent vacancies within the fireteam, some of them quite recent indeed, if you catch my meaning. I appreciate you not shooting me when I came in.”

“Only because you surprised me. Brownsnout, which of the Lost King’s get sent you?” she asked.

There was a long pause from Quills. “The command came from Prince Larkspur Prentiss, my lady.”

“You thought about lying to me and decided against it,” said Amaryllis. “I’ll count that as a point in your favor then.”

“They were going to kill you, princess,” replied Fenn. I could see her eyeing the spot where Quills was hiding behind cover, trying to judge whether it was a shot worth taking. “Personally, I would count that at least one point against him.”

It occurred to me that I was the only one not in a stand-off. I was standing by the door, not hidden behind anything. I had been mute thus far, watching and waiting. I closed my eyes for three seconds and tried my best to keep listening while I looked through the menus. I had points to spend, but what I really wanted was the “Companions” screen. I’d seen the messages, so it didn’t come as much of a surprise to see Fenn there. She had a brief biography there, and to my surprise, so did Amaryllis. I wondered when that had happened. It wasn’t a screen I checked often.
Fenn Greenglass, Loyalty lvl 2

Fenn is a half-elf born to a elven father and human mother. Her childhood was spent with alternating months in the Isle of Eversummer and the colony of Rogbottom. While her ears marked her as exotic and dangerous among the humans, her teeth marked her as a hideous disgrace among the elves. She has never felt at home in either world and pretends to understand less than she does in order to highlight her differences before anyone can call her on them. After she reached maturity she held several odd jobs until settling into a dangerous, solitary life entering into the Risen Lands exclusion zone to take whatever wasn’t nailed down. That life ended when she was arrested selling contraband to a fence. When Anglecynn needed a guide through Silmar City, she was pulled from prison and given a second chance.

“Fenn is listed as a companion,” I said to Amaryllis. “Quills is not.”

“You vouch for her?” asked Amaryllis.

“I do,” I said, hoping that the biography the game had fed me wasn’t lying. I had already cast my lot with Fenn anyway. Maybe if I’d been given fewer threats to my life from Quills’ team, or maybe if they hadn’t made it so clear that my life was worthless to them ... hell, if the teleportation key math had worked out differently and they could have pretended that I would have a spot, maybe it would have all worked out differently.

“Brownsnout, why did you come?” asked Amaryllis.

Quills was silent for a moment. “Juniper and Fenn know enough that I can’t tell any lies which might soften the story,” he said. “I’d have preferred not to do it like this.”

He leapt up from behind the couch, rolled over toward me,

*Thunk.*

And grabbed me by the shirt, whipping me around to put me between himself, Fenn, and Amaryllis. His sword, now with a second hole through it, was at my neck. He was bleeding from his chest, but it was just a red wetness rather than a font of blood. He was breathing quickly, and it smelled like rotten wood.

Then we started moving. Quills stayed as far away from me as he could while still being within range to cut me down. His katana was longer than I remembered it being, with a three foot blade, and he stepped in such a way that he could cover the ground between us easily.

“I think both those women would be fine with me dying,” I told Quills. “I’m not sure what your plan is here.”

“I can handle Fenn,” said Quills. He spoke loud enough that everyone would be able to hear him. “Graduation for the blade-bound involves advancing upon a number of archers, deflecting their arrows until you’ve reached them. I chose to go against five and made it through unscathed. Fenn, you know it’s in your best interest to see this play out. You gain nothing by wasting arrows I can easily turn aside.”

Fenn shrugged and set her bow down on the ground. “You’re right,” she said. “Not my fight. Dibs on going against the loser.”
“As for the princess, she values you,” said Quills. His voice was lower now, his words just for me. “She has a defensive position there, one that took time to set up. She has the key already. My guess is that you’re what she was waiting for.”

“Maybe,” I said, though I didn’t really believe it, not after what I had seen of Amaryllis. “That won’t stop her from taking the shot.”

“It’s stopping her right now,” replied Quills. “All I need is to close the distance.”

Amaryllis had her rifle trained on me as we crept forward. Alright, maybe not on me, per se, but pointed at a target that was right behind me. And Quills was right, she was letting us get closer, one step at a time. Part of that might have been her wanting to wait for a better shot, given that she had a four second cycle time on her rifle. In theory, her best strategy for saving her own skin would be to wait until she could take two good shots before he reached her. For that to work, she would have to get me out of the way, maybe by just telling me to move and expecting me to do it, regardless of how likely it was for me to get bisected. It was in the interest of Quills to keep me going for as long as possible to ensure that he only had to block two shots with his blade, likely taking two more grazing hits in the process before he was on her and capable of killing her. And it was in my interest to just keep shuffling forward and hoping that something unexpected happened. I had theoretical tricks that I could try, half-formed ideas about blood magic that might have done something, but I would only get one shot.

We were almost exactly halfway across the large, domed room when Fenn spoke.

“Ahem,” she said. Quills and I both turned back to look at the half-elf, who had silently picked up her bow and drawn it. Quills was still holding onto my shirt and pulled me closer. We had come to a dead stop.

“Do you think this will accomplish anything?” asked Quills. “It will slow our progress, nothing more.”

“I guess we’ll find out,” said Fenn. Quill’s stance changed, his sword swung around to meet her arrow, and I ducked down behind him (whether through luck or some inkling of what was going to happen, I don’t know).

I guess Quill’s plan had been to bat the arrow out of the air and continue on, or simply outlast whatever was left in her quiver. Using a sword to hit an arrow in mid-flight was apparently part of his suite of bullshit sword magic, so that wasn’t as stupid as it might have sounded.

But when the arrow was ten feet from her bow, it split in two, and then in two again, and again, and by the time the arrows reached him there were five hundred of them. I was down on the floor, not being a lookie loo, so I didn’t actually see it, but in my mind’s eye his pupils dilated in dawning recognition of what was coming at him, enough that he could recognize what was happening but not enough that he could actually do anything about it. More likely, the arrows were going something like 150 mph and his synapses literally wouldn’t have had time to register it, even if his blade-bound powers might have been able to deflect it.

He collapsed to the ground, stuffed full of arrows, and I screamed out in pain, because you don’t fire five hundred arrows at a guy and not also hit the person ducking behind him.

**Brownsnout Quills-in-hand Defeated!**

*Quest Complete: Into the Fryer - The enemies are dead, the key is in hand, and the path forward is clear … but to where?*
“Sorry!” called Fenn as she jogged over to me.

I was shaking in pain and staring down at an arrow that had pierced me in the calf. I had been directly hit by three of them, and grazed by at least one or two others. I was bleeding from my temple, from my side, from my shoulder, and there was an arrow sticking into my stomach which took up surprisingly little of my attention. But for all that, the blood meter in the lower left of my vision wasn’t taking a dip just yet, and my health meter was showing me at seventy-five percent.

“You fucking shot me,” I grunted at Fenn.

“You seem to be a pretty durable fellow,” said Fenn. “Besides, I think it’s better than the alternative of being sliced in half by an angry porcupine, which would have been your ultimate fate. Quills was the one of the four that I least wanted to fuck with, and that had nothing to do with his prickly bits.”

“You fucking shot me,” I grunted again. “Not to sound ungrateful.”

Skill increased: Comedy lvl 2!

“Well, can’t say I wouldn’t do it again,” said Fenn. She leaned down to look over my wounds. “You know, your princess over there still has a gun trained on me, do you think you could find it in your heart to convince her that I look prettier without a hole in my head?”

“Amaryllis!” I called. “She saved my life, I need your help.”

“I have the key,” she called back. “Do you trust her?”

“No!” I replied. “She fucking shot me!” I grunted through the pain. “But she killed the people that were going to kill us,” my breathing was getting heavy from the effort of speaking loudly, “So I think we should all get out of here together.”

“You know,” said Fenn, “You are really harping on this being shot thing, in a way that I do not find very attractive. I did use a bodkin point, you’re welcome.”

To make a long story short, Amaryllis came over and patched me up as best she was able. The three direct hits I’d taken had all managed to miss major arteries and the bodkin point apparently did less damage on entry and exit than some others. The cut on my temple was actually the most alarming, not because of the injury I’d sustained there, but because if it had gone an inch to the left I would have had an arrow stuck in my brain.

“So,” said Fenn, once I was in somewhat better shape. “I am currently persona non grata in the Kingdom of Anglecynn and my read on your political situation is that it wouldn’t be wise for you to return, so where are we going, my lady?”

Amaryllis looked Fenn up and down. “You said she was a companion,” said Amaryllis, “Same as I am.”

“The game thinks she’s loyal,” I replied. “The metrics say she’s as loyal as you were when we were in the sewers. Less than you are now though.”

Amaryllis raised an eyebrow. That wasn’t a metric I’d shared with her. Fenn simply smiled along as though she knew what we were talking about. I did wonder what would happen if Amaryllis said no;
the key was the last bus out of Silmar City, and I wouldn’t have blamed Fenn if she’d fought tooth and nail for it.

“Then we’ll stay together, for now,” said Amaryllis. She pulled something from the handbag at her side, a small golden disc with a glowing green center. She placed her thumb on it lightly and it pulsed to her touch. “Our destination is Barren Jewel.” She glanced at Fenn. “That’s non-negotiable.”

I recognized the name; it was a city in the middle of a desert, sustained by magic, full of cutthroats, and disconnected from the modern world. I wasn’t sure how that would translate in Aerb, which had fairly ready access to both radio and teleportation.

“Is there anything anyone needs before we go?” asked Amaryllis.

“Loot,” said Fenn. “Let me look around here and grab some valuables we can hawk in the Jewel.” She trotted off to snoop around this large room, which I gathered from some equipment off to one side had once been the research facility. Before that, I could only guess; the lobby said it was the office of someone important, but everything else said it was an open living space for a king or CEO.

“I have questions,” I said, “Nothing that can’t wait until we’re safe.”

Amaryllis rested a hand on my arm. “It’s going to be a long, long time until we’re safe.” She closed her eyes and let out a sigh. “I’m sorry I didn’t go back for you.”

“No, that’s --”

“I left you for dead with just enough of a veneer that I could feel at peace about it,” she said. “You must have known that. It wasn’t until I was making the climb that I had to admit to myself that I wasn’t going back for you. I’m glad you’re alive, Juniper. You’re a very decent person.”

“Thank you,” I said. “Wait, did you climb the castle walls?”

But Fenn returned before I got much more than a nod from Amaryllis, and then the disc in her hand started spinning, and we were off to the next part of what I generously decided I would call an adventure.

*Achievement Unlocked: Tutorial Complete!*

END BOOK I
"The city of Barren Jewel lies at the heart of the Datura Desert, surrounded on all sides by hundreds of miles of sand dunes and rocky cliffs. It’s a city of cutthroats where the guards either turn a blind eye or are in on the take, a place of powerful magics lurking in the shadows, with just enough of a veneer of civilization over it that the rich can still sit on the backs of the poor. You crest the hill and get your first look at it just before nightfall, when the sight of city lights after your long journey might seem almost welcoming." I was reading off my laptop screen, which was always awkward, even when I had done some rehearsing beforehand.

“It’s just a model,” said Tom, which he said after pretty much every description of a big city, and somehow it caught me off-guard every time and still managed to be funny.

“So wait, did we pass any caravans while traveling?” asked Reimer.

“No,” I said. “There’s almost no trade going to or from Barren Jewel.”

“So … why does it exist?” asked Reimer. “No, how does it exist? How do they get food and water?”

“Easy, Create Food and Water,” said Craig.

“That’s not,” Reimer began, then he opened his book and began reading without finishing his thought.

“That seems like it would require a lot of magic,” said Arthur.

“It does,” I shrugged. “The Datura Desert wasn’t always a desert, it was once thriving farmland and quiet woods. All that changed when a creeping blight started spreading across the land, killing plants and livestock. It was the mage Alvion who gave his life to create a well of magic in the city that would later become Barren Jewel, a magic that allows that place to thrive even as the lands around it have died.”

“Aw, I liked Alvion,” said Tom.

“He’s … a historical figure?” I said as a question.

“You’re thinking of Alvino,” said Arthur. “Who was from the Scattered Asches campaign and not even a mage.”

“Okay,” said Reimer. “Create Food and Water is a 3rd level cleric spell, they get one of those at 5th level, plus another if their domain is creation, so a single mid-low level cleric can provide 24 hours’ worth of food and water for maybe thirty people, and a 20th level cleric would cap out at providing food and water for maybe two thousand people, if that was literally all they were doing with their magic.” He looked up from the books he had open. “So it doesn’t work out unless there are a hugely disproportionate number of really powerful clerics in the city.”

“We actually moved past that already,” said Tiff. “Joon said there’s some kind of magic that lets the city not have to worry about food and water.”

“All casters in the party are now able to cast Create Food and Water as a 5th level cleric once per day,” I said. “You feel the magic in your bones as soon as you’re within city limits, a promise from the great mage Alvion that you will not starve from the horrid blight that covers what is now the Datura Desert.”

“Yeah,” said Tiff. “Why do people live in Flint, Michigan, why don’t they just move somewhere where there’s clean water and functional city services? Why do people starve to death in Africa when they could just fly to America and buy food from supermarkets there? Why do those dumb Chinese peasants toil away in factories making cheap cellphones for pennies an hour instead of just moving to San Francisco?”

And that led to Tiff and Arthur having one of their famous “discussions” where they argued about upward mobility and late-stage capitalism, or something like that. They were a staple of what I’d call the Tiff-Arthur epoch of our D&D group, because Tiff had strong opinions and Arthur really liked arguing about things.

I wasn’t really paying attention, because I was trying to revise my notes on Barren Jewel to match what I had just improvised.

**Quests**

- **Straddling Worlds:** There are others like you, those with dreams of a place called Earth. The so-called dream-skewered are studied at the Athenaeum of Speculation and Scrutiny. You can travel there to find out more.

- **God Botherer:** There are gods in this world, titans of power and masters of domains, each their own creature with their own special rules. Tread carefully around these creatures, especially if you wish to someday join their ranks.

- **The Lost King, Found?:** Five hundred years ago, Uther Penndraig, figure of legend, King of Anglecynn, and ancestor of Amaryllis, disappeared from this world while on a quest of grave importance. This enduring mystery must have an answer for those brave or foolish enough to seek it, mustn’t it?

---

**Amaryllis Penndraig, Loyalty lvl 5**

Amaryllis is the most direct descendant of Uther Penndraig, the Lost King, which gives her special claim-in-fact to a fair number of his estates and heirlooms bound along cognatic or enatic primogeniture, ultimogeniture, and gavelkind rules. She was once a keystone member of a bloc of power within the Lost King’s Court, but now she has been cast out through means both semi-legal and downright nefarious. Her homeland of Anglecynn is forbidden to her now, at least until she’s gathered enough power to wedge open some doors.
To my surprise, teleportation was extraordinarily painful, and I say that as someone who had, in the past few days, had his arm broken with a pipe, twisted an ankle running from a mass of corpses, lost two pints of blood to undead rats, had a severed vein hastily cauterized, burnt through the flesh of my hand, and was pierced by three arrows thanks to friendly fire. The teleportation key Amaryllis held pulsed with green and then we were no longer in Sorian’s Castle and instead sitting in the sand beside a rocky cliff. The pain all happened in the interim, which didn’t seem possible, because I wasn’t aware of any time passing at all. The effect was distinctly unsettling.

“So,” said Fenn, looking over her bow to make sure that it was still fine. The half-elf was still dressed in the army fatigues she’d been wearing when I met her, now with more blood on them. “Do we have friends in the Barren Jewel or are we just crashing the party?”

“No friends,” said Amaryllis. “But no enemies either.” Her cheek twitched. “It’s just Barren Jewel, there’s no article in front of the name.”

“You couldn’t have dropped us in the city?” asked Fenn. “The gates won’t be down, because they’re never down. Supposedly they rusted shut a century ago.”

“The teleportation key is so valuable it’s a threat to our lives,” I said, as Amaryllis slipped it into her bag. “I don’t know how well it can be controlled, but if someone had seen us appear in a flash of light or whatever, we would have immediately faced some unpleasant complications.” I was gratified to see Amaryllis nodding along.

“Yes, but now we have a different problem, which is that we either have a wall to get over, or we have to talk to some guards and convince them that letting us in unmolested is a better idea than taking our stuff and stabbing us in the stomach,” said Fenn. She sighed and pulled off her pack, one I thought she had probably taken from Leonold’s corpse. “I have things to sell,” she said. “But I need to get into the city to do it. Without money, we can’t get room and board, and Juniper, even if you are remarkably durable, I’m guessing you’ll need some time to heal up.”

“Will you?” asked Amaryllis.

“I healed just before we ran across you,” I replied. “Unless we get into a fight, it’s probably not happening.”

Fenn was watching us with a grin. “Did you know that I like to be in on secrets?” she asked. “That’s something that you should know about me.”

“It’s not really a secret,” I said. I had kept it from Fireteam Blackheart, but that was more a matter of covering for the fact that I didn’t know a damned thing worth knowing. “I mean, unless it should be?”

“Yes,” said Amaryllis, “It should. The things that I’ve seen from you would make you worth an enormous amount of money to either the athenaeums, private individuals, corporations, or countries. Part of that depends on your growth potential, but while we’re in Barren Jewel, it should be as much of a secret as my identity.”

“Are the two of you intentionally teasing me?” asked Fenn with her arms crossed. “Come on, we’re in this together right, I’m a companion, I think it’s only fair that I get to know what everyone else knows.”

“We should be moving,” said Amaryllis. “We’re ten minutes from the walls right now, it’s just around the cliff. Juniper is hurt.”
“I’m dream-skewered,” I told Fenn. Amaryllis trying to compartmentalize information seemed like it was doomed to failure, and I was the best judge of my own injuries. “On top of that, I have some kind of special ability to learn things more quickly than I should, and I have information that I shouldn’t have.” Note to self: Figure out a way of phrasing that which is more concise while also sounding less insane.

“What sorts of information?” asked Fenn with a raised eyebrow.

“In your childhood you spent alternating months in the Isle of Eversummer and the colony of Rogbottom,” I said.

Fenn was already a pale woman, but with the blood drained from her face her skin was practically white. “What was the name of the ship that ferried me?” she asked.

“I don’t know,” I said. “All I have is a paragraph of description. Mostly it was things that I had already figured out.”

“Do I have a description?” asked Amaryllis.

“You do now, you didn’t before,” I said. “I don’t know what changed. Probably our connection.” I hesitated for a moment. “I’ll recite them for you both, in private, when we have some time.”

**Loyalty Increased: Fenn lvl 4!**

That came as a surprise to me, especially since Amaryllis was only at loyalty level five. I wondered whether that came down to the interactions that I’d had with them, or their individual personalities.

“How does the teleportation key work?” I asked. “You think about the place you’re going and then you go there?”

Amaryllis shook her head. “Either you go to a place that you’ve physically been before, or you follow the pull of a touchstone. It can be used once every two hours, no faster.”

“How do you not know that?” asked Fenn.

“Dream-skewered,” I said. “I don’t have any memories before about three days ago. Or I have memories, but they’re from an alternate Earth. Er, sorry, from an alternate Aerb. Uh, one with no magic. Ish.” I turned to Amaryllis, trying to ignore Fenn’s puzzled look. “So you’ve been here before?” I asked, looking at the desert that stretched out endlessly ahead of us and the cliffs behind us.

Amaryllis nodded. “You have a thought?”

“I’m not sure it’s worth anything,” I said. “We want a room within Barren Jewel, some place that we can stay for days if not weeks. I’m injured and the most conspicuous among us, plus I don’t have even basic knowledge of … anything really, customs, money, fashion, language, I’m essentially a blank slate. So if we need a room, the two of you should go in together then come back out and teleport me directly into a room, since I won’t be able to climb a wall.”

“How injured are you?” asked Amaryllis. “Can you wait outside in the heat and winds for two hours?”

“Huh,” I replied. “If I had to put a number on it, I would say that I’m at about an eleven out of twenty-seven. I’m not losing any measurable amount of blood though.”
Skill increased: Comedy lvl 3!

“I just got a point of skill for that,” I said. The best jokes were the ones that no one else got.

“Congratulations,” said Amaryllis. “That still leaves the problem of how we’re going to get over the wall.”

“As high as the one around Silmar City?” I asked.

“See for yourself,” said Amaryllis, stepping forward. Fenn followed, and I hobbled after, my leg throbbing in pain from where an arrow had been extracted.

Barren Jewel was not as I’d pictured it in my head. In my mind, it was something like Agrabah, a place with Moorish architecture and domed minarets. Instead, a twenty foot tall wall (with parapets but unmanned) surrounded blocky buildings with wires haphazardly running between them. I could see only part of it given how tall the wall was, but there was nothing particularly Middle Eastern about it. If anything, it was cribbing from brutalism; the tall buildings didn’t look like places where people were meant to be comfortable, nor did they give the impression that aesthetics had been considered at all, except perhaps that whoever had made them had deliberately moved in the opposite direction. It made me wonder where the ‘Jewel’ part of the name came from.

“What a beautiful sight,” sighed Fenn. “I’ve never been myself, but I’ve heard enough stories, and they don’t do the place justice.” She pointed at a slender building that rose up above the others, by far the tallest in the city, at least from our vantage point. “If that building was a person, it would be an assassin in the dark.”

Amaryllis blanched. “I’d hoped not to come back here. Juniper, what’s your plan?”

“I can punch fast using blood magic, the Crimson Fist,” I said. Amaryllis nodded. “Is there any reason that I couldn’t do the same with my legs?”

“No,” said Amaryllis. “There’s a style of blood mage fighting that uses the legs more than the arms.”

“That’s not quite what I had in mind,” I said. “I was planning on boosting both of you up over the wall.”

It took some time for us to set it up, and then just as I was listening to the sound of my heart with Fenn’s feet balanced on my hands, Amaryllis suggested that I try it with rocks first. I did that twice, getting a feel for it, and on the second time I was able to launch a hundred pound rock fifteen feet in the air, which caused a brief flash of intolerable pain in my leg.

Spell discovered: Crimson Foot!

Crimson Foot: Channels the force of your blood to gain kinetic energy in the form of a kick. Your foot is in no way protected by this spell. Drawing on this spell too often may leave you feeling sluggish. Consumes 3 drops of blood.

Spell discovered: Sanguine Surge!

Sanguine Surge: Channels the force of your blood to gain kinetic energy in the form of a leap. Your body is in no way protected by this spell. Drawing on this spell too often may leave you feeling sluggish. Consumes 5 drops of blood.

Huh. Two spells from trying one thing seemed generous, but maybe it was because I was trying to do something that wasn’t perfectly covered by what the game had in mind.
“I think we should be good to go,” I said. My health bar hadn’t budged, in spite of the pain.

Fenn went first, gamely stepping up with her bow tied to her bag and a prim and proper pose. She stood in my hands, lightly touching the wall for balance. She was heavier than the rock, by quite a bit given what she was carrying. I listened to the beat of my heart and tried to feel my pulse going through my legs, then began a countdown in my head timed to the rhythm. When I got to one, I lifted with my legs and put all my momentum into my arms, sending her sailing straight up, where she deftly grabbed the edge of the wall. I hissed in pain at the feeling of my injured leg, and unlike the time before, the pain didn’t subside. I clenched my fist and ground my teeth as I watched Fenn do a rather gymnastic pull-up that swung her up and over. She stuck an upraised thumb out for us to see just afterward.

“Are you sure you’re okay?” asked Amaryllis. She was eyeing me warily.

“I’ve been through worse,” I said, then when I’d thought about it for a bit, “I’ve been through worse *today*, actually.”

“Alright,” said Amaryllis. She unstrapped her void rifle from her back and rested it against the wall. “I’m leaving this with you. Barren Jewel is technically a minor member of the empire and there’s a ban in place. Use it if you have to. Get some practice in.” She licked her lips. “I’m sorry that I’m leaving you again.”

“You waited for me in Silmar,” I said. “There was nothing to forgive, but if there ever was, it would be forgiven.”

“You think too highly of me,” said Amaryllis.

I was puzzling that over when she climbed into my hands. She was less steady than Fenn was, but she was lighter, both because she was shorter and because she was carrying less. Her hair briefly got in my face as I crouched down; she smelled like the sewer we’d gone through together, and I was sure that I wasn’t much better, if perhaps with a bit more of the smell of blood on me.

It was harder to find the rhythm of my pulse this time. I wasn’t sure whether it was because my heart beat faster around Amaryllis, or because of the renewed pain I was in, but it was a full minute of her standing on my hands and me trying to concentrate before I pushed her up with a grunt. She let out a squeak of surprise at the movement, but grabbed onto the ledge, and I saw Fenn’s pale hands come out to help her up. Then I lay on my back beneath the wall for a bit, where I’d fallen over, feeling the pain of my wounds and the heat of the sun.

This sort of thing wouldn’t happen in a game, or in any sort of narrative, really. The hero didn’t get stuck outside a wall waiting for his companions to come back over and pull him to safety. If I were a very proactive protagonist, I probably would have leapt to my feet, gritted my teeth through the pain, and then used Sanguine Surge to leap up into the air and climb over the wall myself.

Or if I was the other kind of protagonist, the one who reacted to events going on around him … well, let’s see, the obvious thing to have happened was that when I boosted Amaryllis up I would have seen strange, armored hands grab her, or a tentacle, or whatever, or I would have heard her scream in pain, and then I would have been forced to do something about it. Or maybe some guards would come across me and force me into a dungeon I would have to escape from. Or I would see my health going down, or my blood draining from me, through some injury that I’d opened in getting my companions over the wall. Something like that, something to keep me moving and reacting so the plot would keep humming along.

I waited a bit, but there was only the faint hum of the city on the other side of the wall and an
unpleasantly warm breeze, so I continued laying there, not moving.

I was tired. I wasn’t tired physically, because I had leveled up an hour ago and that had gifted me with the equivalent of a good night’s sleep. No, I was tired of this whole thing, being trapped in a strange world that seemed to be a smashed together from things I’d imagined, being ignorant of everything there was to be ignorant about, the lying, the killing … god, the killing. Carter and Tova had been the worst, because I had known them, but I’d killed seven people now. I wouldn’t have done it differently, but it still made me feel a little sick.

“Microhitler”, that had been the achievement I’d been given when Carter died. Craig had been the one to explain it, and I don’t remember where he got it from, but it was probably 4chan. Hitler killed 6 million people, so killing 6 million people could be defined as 1 hitler. Standard SI prefixes applied, so killing 6 people was one microhitler.

(If Tiff had been part of the group during that conversation, I am absolutely sure that she would have done her best Hermione impression and said that actually a Hitler should be defined as killing 11 million people, because it wasn’t just the Jews but the gypsies, homosexuals, et cetera, and actually Hitler didn’t directly kill those people, he gave the orders, and if you accepted that the Nazis were just puppets following orders then you disagreed with the Nuremberg principles.)

The “Microhitler” achievement implied other, more difficult achievements, and I was queasy at the thought that this was a game where it might be possible for a player character to kill six million people. Worse, it might be the sort of game where I would be forced into killing that many people.

I took solace in the fact that the game wasn’t being particularly game-like at the moment. No game I knew of would take a few hours out of the player’s time for quiet, melancholic contemplation while laying in the fine sand. I was tired of this place, but it was finally done forcing things on me, at least for a while.

I woke up, and in doing so realized that I had fallen asleep. Amaryllis was slapping me lightly in the face as my eyes fluttered open. It was nice, to wake up to her blue eyes and her pretty face framed by her long red hair. Her clothes had changed and she was wearing a long white robe with a cinch at the waist and a headband over a hood. She still smelled like a sewer though.

“Still good?” she asked as she looked my body over.

“Yuh,” I replied. “You?”

“Fine,” she said. “Wall’s easier to climb from the other side. Ready?”

I let out a long sigh. “Yeah.”

There was that moment of pain again, that seemed to happen all at once while I was nowhere and no time was passing. It didn’t so much fade away as stop completely, leaving only a memory. Then I was in a dimly lit room with a large bed and a small one, with Fenn standing to one side grinning at me and candles flickering at our arrival.

“The hoomans have returned!” said Fenn with a touch of real glee. “Juniper, did you get in a fight out there, or did you look that bad when we left you?”

“If I had to put a number on it, I would say that I’m now a ten out of twenty-seven,” I said. “So yes, four percent worse.” I laid down on the ground, not wanting to stain clean bedsheets. The floor was cool stone tile, which felt good against my skin. I had heated in the sun while I slept. “Oh, I’ve also lost, um … two or three percent of my blood.”
“Seems irresponsible of us to let him bake,” said Fenn as she tapped her chin. “He’s not making much sense.”

“He has numbers in his head,” said Amaryllis. She knelt down beside me and started looking at my wounds. “They’re apparently moving in the wrong direction. We need healing, probably sooner rather than later.” She looked down at her hands, one with a burnt finger and the other scratched up by zombie rat claws. “I do too, for that matter.”

Fenn nodded. “While you were out I asked around, we have our choice of a disreputable bone mage or a disreputable blood mage. I’m sure that the upper crust have their own healers, but we probably want to keep a low profile, given the whole juicy secrets thing. Say, don’t you think it’s a bit unfair that I don’t have a secret?”

Amaryllis ignored her. “We should get going then. My preference is for a bone mage. Their services are more reliable and with less risk.”

“Also more expensive,” said Fenn. She stuck her thumb in her mouth and bit down on the nail. “We have some money from what I hawked thus far, but it was a raw deal given that I’m an obvious outsider with no contacts. If we’re staying here for a while, better for me to hold off on selling the loot until I have some toehold, don’t you think?”

“Juniper is a savant,” said Amaryllis. “He learned the basic principles of blood magic in the space of a few minutes this morning and got us over the wall this afternoon by applying those principles in novel ways. I don’t know whether this will extend to other skills to such an extent, but if he keeps up this rate of progress then he’ll be able to rival the gods within a month.”

“You’re putting your chips on him,” Fenn nodded. “Now that I get. It’s a bet, but not that foolish of one. Juniper, do you agree that you might rival the gods?”

“Um,” I said. “How easy is it for a skin mage to move tattoos around?”

Amaryllis stared at me with mouth agape. “... did you literally learn skin magic in the three hours we were apart?” She stumbled over that last part, just a bit, I assume because she didn’t want to mention that she’d left me to die. “A skin mage is expected to be able to control their skin to such an extent that they can move a non-magical tattoo by the end of their first year of training,” she continued. “Invested tattoos they can usually move freely, but for those applied by others … when you enter into the athenaeum as a student, they put a tattoo known as a Fool’s Choker around your neck —”

“Yes,” I said, giving a weak snap of my fingers. “That’s the one.”

Amaryllis kept staring at me for a moment, then turned to Fenn. “Juniper is a lever by which the world can be moved.”

“Well, that at least explains why you stuck around waiting for him,” said Fenn with a wry smile. Amaryllis frowned, but didn’t deny it. “Fine, we’ll go see the bone mage.”
I’d had other things on my mind when I got the achievement “Tutorial Complete”, but what little attention I’d devoted to it had been to wonder how in the hell you could have a tutorial section that took three days to clear and featured something like a dozen perilously close brushes with death. Unless the game was meant to be played with a much more generous number of deaths, or it was supposed to be brutally difficult (the Super Meat Boy of RPGs?), everything from when I’d fallen out of the plane to when I’d left Silmar City being a tutorial didn’t make too much sense.

(There was a rabbit hole that I was trying not to distract myself with: the question of what would have happened if I had done things differently. I had been branded a coward by the game for not coming to that nameless girl’s rescue right when I’d first landed. If I had gone over and pulled the zombies off her, rescued her from her predicament … what would have happened then? Or when I’d left the gas station, what would have happened if I had gone away from Comfort instead of towards it? What if I had killed Amaryllis instead of accepting her quest? What if I had somehow convinced her to go toward the Host’s outpost instead of accepting her notion that we should go away from it?

Videogame designers couldn’t actually create that many multiple paths, because there was diminishing marginal utility on each branching path, especially considering that the bulk of players would only play through a game once. In a videogame, there were lots of ways to try faking the element of choice so that the player felt like what they did actually mattered, but generally the changes were cosmetic until it got to the end, where you’d get different endings, or there were two different paths through the game that hit all the same areas and saw you speaking to all the same people.

So in a videogame, trying to go down the road to somewhere unknown when I was meant to go to Comfort would probably have run me into some kind of unstoppable wall, to force me to go where the game wanted me to go. I don’t know quite what would have happened, but it would have been something like the Fuchsia Coterie showing up, or a mass of zombies that I couldn’t beat, or if the game designer were really lazy, then just an invisible wall that broke suspension of disbelief.

But in a tabletop game, it was easy enough to just improvise things. If the party doesn’t want to go to Comfort, then sure, you can take that long road and they’ll think up something for you at the end of it. If I were the GM, I would have planned for Amaryllis to be in Comfort, and if the party didn’t want to go there, or they killed her when they met her, or something else like that, then whatever, she would be dead and I would come up with a new lead-in for that quest, or I would take the hint the party was giving me and figure out a totally new quest.

Or, if you were a sneaky GM, you could do the same thing that game designers did and take away a little bit of choice by making some choices not matter. If the player decides that he wants to go away from Comfort instead of toward it, eventually he’ll find himself in the town of Amenity, which has the same basic design and all the same quests, NPCs, and enemies. Heck, if the player never saw a sign saying “Comfort” then you didn’t even need to rename it.

But what really fucked with my head was that you could do the same thing with people. Let’s say that you wanted the player to meet an important princess from Anglecynn, the recent victim of something sort of like a coup and the main driver of the plot. What I would do is place her down right next to the player at the very start of the game, surrounded by zombies and yelling for help. If this whole thing was like a tabletop game, then a clever GM could have planned for me to see that first girl, and for that girl to have been Amaryllis. After I had run away instead of helping her, I’d been slapped with a penalty, and since I never knew a single thing about her, a different girl could
have become Amaryllis instead, with the whole universe rewriting itself around that change. Come to think of it, I had been slapped with the second cowardice penalty after not running to help a different girl, and it was entirely possible that if I had raced after her and fought her attackers she would have, in time, revealed herself to be Amaryllis Penndraig. And actually, Amaryllis had given me a fake name when we’d first met, so if she’d died, or I had decided not to go back to her, there was still a chance for a rewrite up until the point where I returned with Poul and he recognized her.

In the right kind of tabletop game, reality warped around the player and bridges were built as they were needed.

The length of this digression is why I called it a rabbit hole, and the depth of paranoia and thought I could sink into the idea was one of the reasons I was trying not to question the nature of this reality too much, at least not unless I could come up with something testable, and I had nada thus far.)

When I got out into Barren Jewel though, covered in a hooded white robe that hid the worst of my injuries, I was struck with what the achievement “Tutorial Complete” had meant. Before, I’d been running from one place to another, with clear goals and relatively few metaphorical side streets to check out. Walking (to be honest, hobbling) through the streets of Barren Jewel though, I was enraptured by the sights and sounds, and more than that, by the possibilities.

We passed a creature with chitinous plating and mandibles, walking upright like a person, with a long polearm on his back. Three elves with pursed lips went by us, all a head taller than me, dressed in red cloaks with golden trim, and Fenn cinched her hood to hide her ears from them. I watched a turtle-like creature buying a jar of red powder from an otherwise-normal woman with leathery wings folded across her back. There was a gap in the crowds that I thought was open space, but when we got closer I saw that they were dwarves, not little people but thick, burly, blunt-nosed dwarves with elaborate braids and ornate armor. Most of the people I saw were human, and most were in white, black, or blue robes, but there were also these weird and thrilling things. I wanted to shrug off my wounds and follow the toaster-sized cyan crystal that was floating down the street with purpose, or a lanky man who was still eight feet tall even though he was walking with a stoop to keep from hitting the power lines that criss-crossed above us.

And yes, Barren Jewel was kind of a shithole. All the color seemed to be reserved for the people, with the buildings being a rather uniform off-white color, mostly free from embellishments aside from signs and lettering. There were gutters that stunk more than I did, with the occasional heaped up pile of something rotting. The wires overhead were what my dad would have called an eyesore, and they weren’t up to American fire codes. There were beggars, dirty amputees holding their hands up and small children who raced after me asking for coin I didn’t have until Fenn gave one of them a clap around the ear.

But there was so much to do and see, and it wasn’t like I was playing a videogame where the NPCs were basically just obstacles that would path around me, or where the buildings were just facades with doors that could never be unlocked, this was viscerally real. The world of Aerb had never felt like it was forcing me to do anything, not really, but before there had been a progression and now … I was free to chart my own path through Aerb and decide on what was important to me.

The bone mage’s den was somewhat typical of the architecture I’d seen in Barren Jewel thus far; it was the same off-white material that the walls here (and in Silmar City) had been made from, with a rectangular doorframe that had an ill-fitting door in it. There were multiple holes by the hinges, and I gathered that the person installing it had either botched the door or it had been replaced a few times before. It was recognizably a shop, in that there was a crude logo of a bone on a sign above the door, with another hand-lettered sign on the door saying simply “Kindly Bones”. There were windows, but they were high up, allowing in light but not giving a view to what was inside.
Fenn entered without knocking; Amaryllis and I followed after. There was no proper second story to this place, though it was tall enough for it. Instead there were two long ladders allowing access to the ceiling, where thousands of bones hung down like cloves of garlic in an Italian kitchen. There were bones on the walls too, set in little racks there, and then on the ground there was a wall of cabinets with small drawers, each individually marked with handwritten slips of paper. Atop one of those cabinets was burning incense, which filled the room with a slightly floral scent that didn’t quite cover up a deeper chalky smell.

Aside from that, there was a chest-high padded bench with rotatable arms, and a pale woman with black spots running from her ears down to her collar, where they disappeared beneath her robes. She sat behind a small desk with some papers.

“Welcome to the Kindly Bones, I am Magus Bormann,” said the woman with a short bow, palms pressed together. “How may I serve you?”

“We’ve come for some healing,” said Fenn. “My friend here was accidentally shot with a number of arrows by a party who shall remain nameless.”

“It was you,” I said. “You were the one who shot me.”

“Disrobe and let me see,” said Bormann. Her eyes went to Fenn. “Consultation is free, but can I assume that you will be the one paying?”

“Grudgingly,” Fenn shrugged.

I took off my robe, revealing my torn up jeans, shredded shirt, and bloody wounds. We had discussed it, but elected not to change me out for something else, in part because I was certain to get anything I wore bloody.

“Fully disrobe, if it’s not too painful,” said Bormann. “Have you taken healing from a bone magus before?”

“No,” I replied. I looked to Fenn and Amaryllis (amusement and apathy, respectively), then began taking off my clothes, wincing when dried blood pulled away from my flesh. I sat up on the padded bench and removed my jeans as well, cursing as I pulled the cloth away from my thigh. I was somewhat gratified to discover that my body had undergone changes for the better; I wasn’t exactly ripped, but I had visible abs when I wasn’t sitting down. I hadn’t been fat or paunchy back on Earth, but my dad had some cause to use the word “scrawny”.

“Hrm,” said Bormann. She briefly poked at the wound in my stomach, then at the one in my leg, and after that went to the lacerations I’d taken from the arrows that had mostly missed me. “Was the intent to treat only the most serious of wounds, or all injuries sustained?”

“All,” said Fenn. “Again, grudgingly.”

“Then I think it can be done for half a million tcher,” Bormann said, speaking to Fenn. “He’s in good health, aside from his wounds, no obvious complicating problems, no other visible magics that might interfere.” Fenn grumbled, slipped a hand into her purse, and pulled out a handful of paper notes that Bormann took and counted swiftly. “Lay back and we’ll begin the work. It should take roughly two hours or so.” She looked to Fenn and Amaryllis. “You may leave and come back, if you have pressing needs.” Fenn left quietly, while Amaryllis stayed.

“That,” I began, seems long. But I was comparing this woman against Tova, an intimidating woman working under pressure and presumably with vast resources.
“If you have a question, I am free to answer,” said Bormann. “This type of work does not require terribly much attention at this point in my career.”

“I was wondering what it took to learn bone magic,” I said. “Or … anything about it, I guess. I’ve seen it performed once, in an emergency, but beyond that …”

“Let me get the bones first,” said Bormann. She went to one of the cupboards and withdrew a number of bones, which she laid down on a tray table beside the padded bench. She held them up, one by one. “The chief aspect of healing is vitality, so for that we select from resilient creatures. In this case, the Eastern carrier gull, and more specifically, his ribs, which will correspond to your torso, and his leg bones, which will correspond to your leg, plus a few others for the more minor injuries.”

She took a narrow rib not much longer than a finger in one hand and placed her other hand on my stomach, right next to the wound. The bone glowed, very faintly, and a tiny odorless curl of smoke rose from it as she did her work. Eventually she set the bone to one side and picked up another, identical one to repeat the process. I could feel something happening in my stomach, but it was slow going.

“I had five years at the Athenaeum of Bone and Flesh,” said Bormann, “That’s about the minimum required to call yourself a proper bone mage. Study mostly consists of understanding skeletal structures of various animals and how it relates to their aspects, along with the study of aspects and the mortal form. We don’t learn how to pull from the bones until the second year.”

Three more bones had been used while she spoke, and the pain from my stomach had subsided somewhat.

“Almost done with that section, we’ll do your leg next,” said Bormann with pursed lips. “Is my talking calming to you?”

“Yes,” I replied. “So, ow, so you pull aspects of creatures from their bones?”

“Just so,” said Bormann. “Vitality is the most widely useful, because the effects fade as soon as the bone has had its essence pulled from it. With vitality, the concentrated healing remains. The other four aspects are swiftness, strength, focus, and intellect.” She said that last as the wound on my stomach finally closed completely; she wiped away some dried blood there with a stained washcloth and moved on to my leg.

Vitality, swiftness, strength, intellect, and focus. Or, rearranged, strength, swiftness, vitality, intellect, ________, and focus. Which is really close to power, speed, endurance, cunning, knowledge, and wisdom, which appeared in a neat little column by my character sheet.

“What about knowledge?” I asked.

“Ah, you’ve heard stories,” said Bormann. She had the leg bones in hand and was looking over my arrow wound some. “Bone mages sucking the memories out of a person’s skull, that sort of thing?” I nodded cautiously. “Well, it’s not so dramatic as all that, if you pull deep it’s too many memories all at once, disorganized and opaque, and if you take a shallow pull you get pieces too disparate to make sense of. And either way, it needs to be written down or dictated quickly before it fades, which creates its own problems. People always think of it as having their secrets scooped out of them, but that’s not how it works in practice. Either way, it’s not really an aspect as such, and rarely studied.”

Amaryllis spoke up for the first time. “Juniper, if you have further questions, I think it would be better for you to hold off on them until we’ve had a chance to talk.”
Bormann raised an eyebrow at that, but she was enough of a consummate professional that she didn’t question someone coming in with multiple arrow wounds, and she continued on about her work without further comment.

Amaryllis was probably right to keep me from asking more questions, because for all I knew I was three seconds away from asking a question that would expose me as either not knowing things that everyone knew, or knowing things that no one was supposed to know. The former wasn’t that much of a problem; I was fine with being branded an idiot, if less fine with raising eyebrows. The latter could get us killed, especially given how scarce our resources were.

So instead, I sat silently and did some thinking about bone magic. The aspects that Bormann described pretty clearly mapped to the attributes on my character sheet, minus the social attributes, the umbrella attributes, and luck (maybe, unless they categorized those differently). That made bone magic really easy to graft onto the game layer; all you’d need is some logical rule that said “when you pull from a bone, choose an attribute that animal had in life and add it to your own”. I was guessing it was more complicated than that, but I would have an incredible advantage in bone magic even above and beyond my ability to skill up, because I would be able to actually see the mechanical changes.

“Are there other ways to learn how to become a bone mage?” I asked. I caught Amaryllis giving me a slight frown, but she didn’t so much as give me a small shake of her head, so I figured I was on safe ground. “Are there people who train outside the athenaeum?”

“It’s illegal under imperial law,” said Bormann with a grin. My blank face must have given away that I didn’t get the joke, because her grin fell away.

“The argument goes,” Amaryllis began, “That there is a limited number of good, useable bones in the world, and though new bones are being made all the time, that still leaves a limit on how many are created a year, both through natural processes and on farms. A lackluster bone mage pulls less from a bone than a superb one, which means that a weak bone mage goes through far more bones, depleting a scarce resource and overall increasing the price of much-needed healing in the long term. I’m sure that the players in that game are transparent to you,” Uh, no? “The Athenaeum of Bone and Flesh gains in power if they’re the only source of accredited bone magic, existing bone mages get to take out the competition and keep their prices high, the Athenaeum of Quills and Blood sits on the fence for a bit because on the one hand restricting healing to accredited bone mages means that blood mages have some benefit from decreased competition, but on the other hand it lowers the relative prestige of blood mages and those who teach it because now there’s this bottleneck of privilege, and then there are all the farmers, hunters, trappers, et cetera who make their livings, in part, off providing bones, and they’re of course staunchly against this change in imperial law because of how it affects their bottom line, on and on until you have hundreds of voices arguing with varying strength that the imperial law is either good and bad, and eventually the vote gets decided by some combination of money and influence rather than whether it’s actually good policy.”

I could practically hear Reimer with his refrain of “blah, blah, blah, politics”. My problem was, I didn’t actually have the context for most of this to be that meaningful. At a best guess, the athenaeums were like super powerful universities with alumni at high ranks in various companies, political fields, and probably militaries. The empire … was a thing? Actually, all I knew was that there was a thing called imperial law which Bormann found funny for some reason.

That was when I realized that Amaryllis wasn’t feeding me information, she was covering for me. I hadn’t interpreted Bormann’s joke in the right way, Bormann had noticed, and Amaryllis had both offered a distraction and an explanation for my confusion. I wasn’t some idiot who didn’t know why imperial law deserved a smirk, I was obviously confused about the political reasons behind the ban
on unlicensed bone mages.

“Are you one of those I should go to if I have problems with political solutions?” asked Bormann. “Most of my clients are involved in a skilled trade, it’s not often that I meet someone who understands what actually goes on in the empire,” She continued with her work, sealing the wound on my leg entirely until there was only a small pink mark where the arrow had entered, then moving on to the minor wounds. “Though to be frank, one of the things that I’ve missed least about the athenaeum is how invested everyone was in imperial goings-on.”

And with that rather diplomatic end to the conversation, we were again silent. I was feeling much better, though still a little light on blood, and I was content to just keep my mouth shut instead of asking more questions. It wouldn’t be too long before I would have some time alone with the rest of what I was starting to accept as my party. Rather than doing nothing, I closed my eyes and looked at my character sheet, but none of the numbers seemed to be changing with the application of bones. With my eyes open and on my hitpoint total, I could occasionally catch it ticking up if I was paying attention, but that was a digital representation of an analog process, or maybe the hitpoints were just a best guess at how healthy I was. (I hadn’t increased my END since turning hitpoints on, but I was going to pay attention when I did.)

“Looking much better!” said Fenn as she sauntered in. “Though I suppose you should be, for half a million tcher.”

“He was lucky,” said Bormann. “The arrow in his leg just missed his femoral artery. The one in his stomach managed not to pierce any internal organs. Whatever you were doing, I would highly suggest that you not do it again … though if you do, I hope that you remember me.” She laid a bone down on the metal tray, then dipped her hands into a small bowl of water and began rubbing them. “The work is done.”

All my wounds had been sealed, now leaving only small pink areas of new flesh. So far as I could tell, what the bone mage had done wasn’t so much magically knitting my flesh back together, she was accelerating the process of natural healing by a few orders of magnitude.

“The girl too,” said Fenn. “She has some cuts on her hand, and a burn, I think.”

Bormann went over to Amaryllis and looked at her hands with a frown. “This burn … blood magic?”

Amaryllis shrugged.

“It’s important that I know, so that I can properly heal you,” said Bormann.

“What exactly would it cost to eliminate your need to know?” asked Fenn.

Bormann frowned. “Double the rate, if you want me to pour more magic in and hope for the best. I also won’t make any guarantees about the quality of the healing.” She looked at Amaryllis’ other hand and stifled a sigh. “You took these wounds earlier today, by the look of them. Were your nails yellow then?”

Amaryllis looked closer at her hand. “No,” she said cautiously. “Infection?”

“It might be rat rot,” I said. The three of them looked at me. “I had it once. That’s what I was told it was called.”

“I’m unfamiliar with it,” said Bormann. “Fifty thousand tcher for your wounds, half that if you tell me more so I can make an assessment. And if rat rot is a disease, I don’t know what it would take for
me to burn it out of you. It would be a good way for me to line my pockets, if I was the sort of healer who liked to string people along.”

“Do we have your confidentiality either way?” asked Fenn.

“No,” said Bormann. “If the city guard comes knocking and asking about people who were involved in something they shouldn’t have been, besides just shooting each other with arrows, then I’ll tell them what I know with only the slightest pushback.”

“Then we’ll pay the full rate,” said Fenn. “Better you not know, if you’d be obliged to tell. And we’ll deal with the rat rot later, if we have to.”

Once we were finished, Fenn pulled some clothes out of her bag for me and I put them on. It was nothing special, just a t-shirt and some ill-fitting pants, and it was all somewhat loose, but my robe went over the top of it anyway. Bormann graciously offered to toss my old clothing and then we were on our way.

“So,” said Fenn once we were outside. “I’m thinking that a bathhouse is the next thing on our list, some place that we can wash off the stink of our misadventures.” She yawned, stretching out briefly touching the bow on her back, as though to reassure herself that it was still there. “Also, Juniper, you’ll be glad to know that I found out why we’re really here. No friends, but no enemies either, that might have applied to a dozen places that we could have gone. There’s a deeper meaning to why Barren Jewel was so very, very non-negotiable.” She smiled, but it didn't reach her eyes, and there was no humor left in her voice.

“We should keep our voices low,” said Amaryllis. “We can discuss this in private. I had planned to, after we’d gotten some rest.”

“Suit yourself,” Fenn shrugged. She cast me a raised eyebrow just before she turned away.

We had a very silent walk back to the inn, and though I was no longer limping, the sudden tension between the group was doing its own job of sapping the wonder from me as we walked the exotic streets.
“So,” said Fenn as soon as we were through the door to our room. “I finally figured out what this companion thingy reminded me of: a kharass, an elf cultural thing. Basically, there are groups of people who are cosmologically linked to one another by a wampeter, which I guess is their … purpose is close, but theme might be closer. I’ve always been garbage at translating.”

“We were going to talk about why we’re really in Barren Jewel,” I said.

“Oh hush, I’m getting there,” said Fenn. “See, I’ve been thinking a bit about us as a trio and what our theme might be, what might unify us. A princess, a looter, and someone with brain damage? There wasn’t that much in common. After a little bit of time though, it occurred to me that we are all displaced in one way or another. You have probably noticed by now that I’m a half-elf, which leaves me between worlds. Juniper thinks he’s an Airthian stuck here on Aerb. And Amaryllis is a princess without a kingdom, a noble among the poor.”

“And?” asked Amaryllis, after a pause in Fenn’s monologue.

“And I was thinking that my situation is not one that can be solved. I will never be an elf, I will never be human, and there are no sanctuaries for half-elfs, nor would I go to one if I could. I was cast out of the two homes I was born into simply by the nature of my birth. Likewise, Juniper’s situation has no solution. There is no place called Airth, there’s no way for him to go home, his displacement is as permanent as mine. Yet you, princess, you want to go home, and while that might just be feasible given the benefits of your bloodline and with Juniper’s help, it’s not part of our wampeter. It can’t be, because neither Juniper or I have any stake in the matter. So, you tell us why we should brave the thaum-suckers of the desert and take back your ancestral home.”

I raised my hand. “Can I ask, are you pronouncing Earth wrong on purpose?”

“I don’t want to take Caer Laga back,” said Amaryllis. “There are a significant quantity of magic items there, all of which should be mine to bind to.”

“Either way,” said Fenn. “This is an ‘Amaryllis gets what she wants’ type of plan you were going to pitch us, and while Juniper might go along with it because you’re a young, stunningly attractive female of his species, I personally must make my reservations known, especially if we are unified by cosmological purpose.”

“I’m missing several things,” I said. “First, what is a thaum-sucker?”

“They’re a creature that feeds on magic,” said Amaryllis. “The Datura Desert would be dangerous even if it were only four hundred miles of hot sand with no water or plants to speak of, but it’s the thaum-seekers that elevate it to the level of a major exclusion zone. It is true that going to Caer Laga would require us to brave them, but I have confidence in our abilities, so long as we have some time to prepare, which I believe we do.” She turned to Fenn. “You’re a self-confessed looter, I would have thought I would get less resistance from you.”

“I never looted for the love of it,” said Fenn. She rubbed her chin. “That is to say, I did love the feeling of finding buried treasures, and the, um, archeology, looking through other people’s things, and I loved surviving with only my wits, my luck, and my grossly overpowered warbow. And I loved the solitary nature of it too, certainly. But for all that I’m not some idiot who would have gone and done it if there was some other profession waiting in the wings for me.”
“That’s not why you don’t want to do it,” I said. “You would have led with ‘it’s hard and dangerous’ if that was what was really motivating you.”

“Can we talk about the elephant in the room?” asked Fenn. I nodded. “We are in possession of a fucking teleportation key.”

“Um, I don’t really have context for that,” I said. “Amaryllis told me it was our ticket out of the Risen Lands, and that it was valuable, but … it does seem really useful, and it’s irreplaceable, I get that, I just don’t … really understand the fuss except by inference.”

“Dream-skewered,” spat Fenn, as though it was a swear word. “Oh, this is not going to be very fun.” Then she brightened slightly. “Except, wait, you don’t know any jokes from Aerb, do you? This duck walks into a bar and asks, do you have any grapes?”

“When originally created, there were a thousand teleportation keys,” said Amaryllis. “Some were lost over time, a very few destroyed. At current, they number just over nine hundred, but that’s including some guesses as to which are held in private hands or otherwise kept secret. Five people, twelve times a day, times nine hundred keys, means some fifty-four thousand people traveling freely around the world every day. It’s the backbone of intraimperial travel. It’s the glue that allows the empire to functionally work. Now, the value placed on teleportation for a single person is close to ten thousand obols, which means that the per-day value of a teleportation key is six hundred thousand obols.”

“Define obol,” I said. “Define it in terms of … a loaf of bread. How many obol does a loaf of bread cost?”

“And does a spoiled princess know?” quipped Fenn.

“It depends on the sort of bread,” said Amaryllis, with a roll of her eyes in Fenn’s direction. “Barren bread sells for something like a tenth obol apiece. Proper bread, the kind made using wheat flour, would be more like two or three obol. Anything made by an artisan would be more.”

I nodded along, letting the confusing words wash over me. “Okay, let me pick a new metric, how much would someone get paid in hourly wages for, say, being a cleaner? Not a professional, just a small job that needs doing?”

“Five obol, maybe,” said Amaryllis. Which was just about minimum wage. Which probably means that the value of an obol is close enough to a dollar that I’m not that far off if I freely convert the two.

“Thank you for the context,” I said. “I think I understand … except that we used tcher to pay for the bone mage.”

“Is this really something that we should be talking about right now?” asked Fenn. “I personally thought that we were trying to discuss, oh yes, the fact that we have a fucking teleportation key. Or was I the only one interested in that?”

“I am,” I said. “But how easy is it to extract value from? You said before that they go to either the touchstones or where you’ve been before. I would imagine that we don’t want to go to any of the touchstones, because people would see us and steal our incredibly valuable teleportation key that we’re really not supposed to have. That leaves us with the places we’ve already been, and this is another place where I’m sure my ignorance is showing, but … I was also told that bulk teleportation of non-living things is relatively cheap, and you have radio technology, which means that being couriers is probably out, even if we could do that without drawing attention to ourselves, and that leaves … smuggling?”
“See?” Amaryllis asked Fenn. “Juniper has been in this world for three days and he can see all of the inherent problems. Smuggling? We’d be starting from nothing and going against all the gangs, cartels, syndicates, et cetera in Aerb who are already doing their best to occupy that same niche. And they have production, distribution, and economies of scale on their side.”

Fenn shrugged. “Point taken, regretfully.”

“So then the question is how to leverage the teleportation key without drawing undue attention to ourselves, and without putting ourselves in a position where we’re in danger,” I said. “That leaves looting, doesn’t it? We can return to the top of Sorian’s Castle and take everything there that’s not nailed down.”

“I’m not sure that’s wise,” said Fenn. She turned to Amaryllis. “You knew that the key was there. Fireteam Blackheart knew it was in the city. Blackheart got written off, but who else is going to be looking for it? If we teleport in, how likely are we to be surrounded by angry men with swords and guns?”

“I need a day, or maybe as much as a week, to get some news from Anglecynn,” said Amaryllis. “Internal politics are hard to track from the outside. Unless we have some pressing reason to rely on luck … the odds that someone will be waiting for us, or that there will be wards set up to catch us, are unacceptably high and get higher as time passes.”

“And yet,” said Fenn. “Caer Laga beckons.”

Amaryllis bit her lip hard and winced at the pain. “Alright,” she said. “Can I make a proper pitch?”

I nodded and Fenn laid back on the big bed before saying “Fine.”

“Juniper, first you need a very brief education,” said Amaryllis. Fenn let out a “harumph” at that. “Just as on your world, there are artisans on Aerb who make all manner of things,” continued Amaryllis, speaking quickly. “Sometimes, for reasons that no one really understands, one of these artisans will go into a forge frenzy where they’re overcome by a very particular idea and become dead-set on pursuing it, to the exclusion of money, reputation, family, sleep, food, et cetera. Once they’re finished, they come out of it, and sitting on their workbench, or wherever, is this thing that they didn’t actually know how to create, drenched in otherworldly magic and utterly, forever unique. Those are the entads. You’ve seen two of them so far, Fenn’s bow and the teleportation key.”

“But you said there are a thousand of the keys,” I said.

“All thousand were created at once,” said Amaryllis, “All in the course of a single forge frenzy. Supposedly it was a giant tower of keys that interlocked. Anyway, the entads range from useful to overwhelmingly powerful. Now, one of the quirks that most of them have is that they don’t change ownership lightly.”

“Ah,” I said. “Some are bound along cognatic primogeniture lines while others are gavelkind.”

Amaryllis stared at me. “It was in your biography, which I still need to read for you. But I get the gist of it, there are magic items that pass down as heirlooms that you have claim-in-fact to, and some of them are sitting unrecovered in Caer Laga for some reason.”

Amaryllis paused to consider her words. “Caer Laga was abandoned by my great-grandfather with wards still intact and a cache of heirlooms, primarily because of the cost associated with maintaining it within the Datura. My bloodline gives me the right to pass through the wards with the two of you in tow. There shouldn’t be anything within and we should be able to use the teleportation key to leave, which means that the only risk involved is in passing through the Datura and facing down the
thaum-seekers.”

*Quest Accepted: Mothballs - According to Amaryllis, one of her ancestral homes lies empty with riches bound to her within it. Unfortunately, it's quite some distance away through hostile territory. Prepare carefully.*

“I’m in,” I said. “So long as we have some time to prepare.”

“I’d like to first off know what’s in it for me, second to know precisely what you’re hoping to gain from it, specifically the nature of these entads, and third, I want to know what the wampeter of our kharass is. Except I think those are actually in the opposite order of importance, so invert that list,” said Fenn. She didn’t seem concerned that I had accepted quickly.

“I don’t think wampeter and kharass are applicable to us,” said Amaryllis. “Except insofar as they represent useful terms for us to work with in forging a temporary or permanent team. As for the others, the answer to those questions is the same. Three of the seven heirlooms I believe to be at Caer Laga can either be used by the three of us as a whole or given to the two of you through investiture.”

“Well at *that* I’m all ears,” said Fenn. “You should have led with it.”

“I would have,” said Amaryllis with ice in her voice. “But you came in here talking about elfish traditions and how I was being too concerned with furthering my own interests.”

“Oh, I still think that,” replied Fenn. She had been laying on the bed, partly talking to the ceiling, but now she sat up and pointed a finger at Amaryllis. “You have more to gain than we do, and our gains will be chained to your successes or failures. Let’s say that you invest Juniper with a fancy new sword and weeks or months down the line you have some disagreement with him. That fancy sword was candy you dangled in front of him, but now it’s leverage over him.”

“That is entirely in the nature of investiture,” said Amaryllis, rubbing her face. “I don’t understand why you’re being so difficult about this. What is it you propose to do instead?”

Fenn frowned. “Better for us to get this out now,” she said. “I’ve traveled with people before, partnered for mutual benefit, and if you go skipping off happily into the sunset then come nightfall things get out of hand. I’m game for going to Caer Laga, so long as we do it with open eyes.”

Amaryllis stared with mouth agape. “You … you were willing to go this entire time?”

“Certainly,” said Fenn.

“Alright, fine,” said Amaryllis, swallowing whatever else she might have wanted to say. “Then we need to stop wasting time and get to planning.”

“The two of you smell,” said Fenn, “And I’m not so hot myself. So long as we’re not under a time crunch, I would propose that we find a bathhouse posthaste, get a night of rest, and then plan in the morning, with some sanity restored to us.”

Amaryllis made a strong argument that I shouldn’t go anywhere without having roughly two weeks of education in what not to do in Barren Jewel, but Fenn kept cracking jokes about the sewers smell and complaining that we were going to have to throw away one of the sets of new clothes that she had bought us. Maybe Amaryllis was as close to her limits as I was, because eventually she relented.

“It’s best that you not talk to anyone,” said Amaryllis. “I think you’re smart enough to figure out why. We’ll be apart while we change, which I think is the most dangerous moment, but at any other
time the two of us can cover for you.”

“I think you’re overcomplicating this,” said Fenn. “There’s such a thing as being too paranoid.”

I laughed at that. “That really makes me want to stay inside,” I said. “The kind of people who say that there’s such a thing as being too paranoid are invariably not being paranoid enough.”

“Is that an Airth thing?” asked Fenn as she scrunched her nose at me.

“Okay, so you definitely are saying it wrong,” I replied. “And no, it’s not really an Earth thing. I don’t really have the proper qualifications to speak on what is or is not the proper level of precaution. We seemed to do fine with the bone mage.”

“You almost gave yourself away,” said Amaryllis. “Just don’t talk. Any questions you have can be raised later, with us, in private.”

That left the question of the teleportation key, which was worth something like billions of dollars in future earnings. Amaryllis had been guarding it closely and visibly touching her handbag for it often enough that if I were a thief I probably would have gotten a glint in my eye just from that. Going into the bathhouse would mean leaving it with her clothes there, which was a non-starter. Leaving it at our inn was also not an option, because the elderly innkeepers apparently couldn’t be trusted not to go through our things (at least according to Fenn).

My idea had been to hop the wall again and hide it out in the desert, but that was because I was ignorant of the fact that this problem could be solved using magic.

The tattoo mage seemed a little too pleased to be looking at Amaryllis for my tastes, at least until he got a whiff of her. The bone mage hadn’t complained, but she also had the benefit of incense in her shop and a specialty in medicine. After some negotiation with Amaryllis and payment from Fenn, he began a tattoo on the inside of her left arm. To my surprise, he was using a mostly modern looking tattoo gun which was plugged into the wall. I’d never had a tattoo myself, but I’d gone with Tiff when she wanted one to memorialize Arthur. The biggest difference between the tattoo shop in Bumblefuck, Kansas and the one in Barren Jewel was the effort put into sanitation; Amaryllis was getting a tattoo from a guy who didn’t seem like he’d ever heard of latex gloves, cross-contamination, blood-borne illnesses, or anything like that. Amaryllis closed her eyes while he inscribed a circle on her skin. Her tattooist kept looking at her. Any leering he’d had before was replaced by wariness, bordering on fear.

“Can we talk?” whispered Fenn as she slipped her arm in mine. “This will be awhile.”

“Sure,” I replied. She pulled me along until we were outside the shop.

“So how in love with her are you?” asked Fenn. This was about as serious as I had seen Fenn, aside from when she’d told me that Quills and friends were going to kill us.

“Uh, I’m not,” I replied.

“Okay, on a scale from 0-9, how in love with her are you?” asked Fenn.

“There are a lot of different ways to divide up love,” I replied. “Physical attraction, emotional attraction, empathy, those sorts of things. I know you think that my mind is clouded because I’m a teenage boy, but –”

“No,” said Fenn. “I’m worried that I’m about to be the third wheel in this little group we have here. I see how you look at her, and I see how you don’t look at me, even when I’m giving you little lovers’
kisses.”

“That’s not —”

“It’s fine,” said Fenn. “I’m under no illusions about how I compare to a princess,” the word left her lips at a bare whisper, so quiet that I probably wouldn’t have caught it if I couldn’t see the movement of her lips, “and I know a half-elf is no one’s idea of a catch but a pervert’s.”

“I think you’re pretty,” I said.

**Skill Increased: Flattery lvl 1!**

“Well, you’re a pervert,” said Fenn with a smile. “You really walked into that one, didn’t you?”

“Look,” I said, “I think you’re probably worried about what it’s going to be like down the road, right? If everything goes well in, um, that place we’re going, then that will cement us as a team, even if it’s just one of mutual convenience. You’re thinking that if I were to fall head-over-heels for her then you would always get outvoted two-to-one, and that’s a perfectly reasonable fear.”

A silence lingered between us for a bit. “Except what?” asked Fenn. “Isn’t this the point where you’re supposed to make some soothing sounds at me about how you would never, ever do such a thing?”

“I don’t know,” I replied. I watched the people going by us and was momentarily stunned to see someone riding an ostrich-sized bird. “I’ve been in this world for three days. I’m missing huge swaths of knowledge about how it works and who the people in it are. Your fear seems reasonable to me. If you want me to give you my assurances, I guess I could say that our traveling companion scares me a bit, that she’s too impersonal to have much a connection with aside from what my special eyes tell me, and I’m much more focused on …”

I came up short. This was the place where I should maybe have said that I was focused on getting home, but the truth was that home kind of sucked. Home was a place full of anger and sadness. It was a place where people kept saying that it would get better with time, and they had been right, but I sort of still didn’t believe them. Aerb was all fresh and new, a complicated, aged, worked-over world, but here I was free of scars, and whatever emotional stuff I was working on had been dropped at the door, at least for the time being. I was worried that Aerb was eventually going to make me face some things I didn’t want to face, but until that point, and so long as I was gifted with superpowers and not in that much danger, I didn’t really want to go home.

“Personally,” said Fenn. “I want a big old castle with lots of servants, handsome men waiting on me hand and foot, exotic foods and thrilling plays, and enough wine to drown in if I so choose. Not such a bad goal, if you’re looking for one.”

I didn’t believe that for a second. Partly that was because characters in movies, novels, and games never had that simple of a motivation, even when they claimed to. The mercenary always had some tragic backstory to be solved, or some deep underlying issue that would mean that they would never be happy even if they got their gold-plated castle. The crude biography I had for Fenn seemed to say as much. I also didn’t believe her when she said that looting an exclusion zone was her only viable path in life.

“We should get back,” I said. “I don’t want her thinking that we’ve run off. I’ll take what you said under advisement, and I can at least promise that right now I don’t think we’re close to forming any ironclad voting blocs.”
Fenn nodded and clasped me on the shoulder. “You know, I somehow find that more comforting than a blanket assurance. It shows you’re thinking, at least.”

**Loyalty Increased: Fenn lvl 5!**

When we got back into the tattoo parlor, Amaryllis was just finishing up. I don’t know whether she noticed us leave or not, but her eyes were still closed and her face still calm as the tattooist completed the elaborate circle on her skin. When he was finished, he touched it with his bare fingers. Though the skin was red and raw, Amaryllis showed no reaction to this.

“Package?” the tattooist asked.

Amaryllis opened her eyes, reaching into her purse, and pulled out the teleportation key, which was wrapped in white cloth and tied shut with twine. He took it without a word and with a squint of his eyes the tattoo started spinning on her skin. The circle was a hand-length across her arm, curving with it. I watched carefully as the key was shoved into her skin, passing into it with only token resistance. When he was finished, ink moved within the spinning circle, then became part of it, until it reformed into a simple, unmoving image of a package tied up with string.

“Done,” said the tattooist. “To pull it back out, grab at the edge and concentrate on it.”

“I know,” said Amaryllis, flexing her arm. The redness of the fresh tattoo had faded completely, and once she had put her robes back on, there was no way to tell she had a billion dollar magic item hidden within her skin.

And with that, we were off to the public baths.
The closest thing to public bathing I had ever experienced was in the high school locker room, which had rows of showers lined up and nothing in the way of privacy. I’d say it was obvious that the showers were segregated by gender, but that was manifestly not obvious to the people of Barren Jewel. I paid with money Fenn had given me, stuck my clothes in a cubby, walked out with a towel provided by an attendant, and was greeted by a sea of flesh.

From the outside, the public baths were a big, ugly building, unpainted and unadorned except for a texturing that looked like it would scrape my skin off if I brushed against it. Inside though, a wide open space with tall, sculpted pillars holding up a glass ceiling that let in the last of the waning light. There were sconce lights at regular intervals, each with their own flame, some of them so high up I was left wondering how they were lit. Everywhere there was color, from the turquoise and gold tile to the green and red murals on the wall that depicted an elaborate pastoral landscape. In a way, it was the opposite of the streets of Barren Jewel; there I had seen plain buildings with colorful people walking between them, but here it was a beautiful, lovingly wrought interior with plain, unadorned people, all either nude or with simple white towels.

Which wasn’t to say that I found the people unnoteworthy, because there were skin colors we didn’t have on Earth, people with odd proportions and strange protrusions, men with tusks, women with feathers, and the occasional upright animal with wet fur. Most of the people looked human, but the ones that weren’t drew my attention.

“It’s rude to stare,” said Fenn from beside me, which made me jump. She had a towel wrapped around her, leaving her with some modesty. When I looked at her arms, I realized that I had never seen them uncovered. She had keloid scars in precise patterns starting at the joint of her shoulder and running down to the middle of her forearm. They were curlicue, almost organic looking in their shape, but exactly identical on both arms.

“See, I say that it’s rude to stare, and what do you do?” asked Fenn.

“They’re very pretty,” I said.

Fenn turned away from me and shrugged. “They weren’t exactly my choice. And they’re non-functional, in case you’re wondering.”

I hadn’t been, because until that moment it hadn’t occurred to me that one of the differences between ‘skin magic’ and ‘tattoo magic’ might be that there were other sorts of magic you could do with the skin. If I was right in assuming that skin magic extended to ritual scarification, then what else was there? Intentionally stretching the skin? Piercings? I had eight levels in the skill, but knew practically nothing about it. I was about to ask Fenn more, even given her obvious discomfort, but then I saw Amaryllis, who had shed her towel and waded into the water.

I didn’t really have enough experience to say whether this was true of all public baths, considering that the one in Barren Jewel was the only one I had been in, but it wasn’t a particularly sexy place. There were families bathing there with small children running around them, and though it didn’t seem like Aerb was in the middle of an obesity epidemic in the same way that the Midwest was, there were plenty of people whose bodies were far from what I’d define as aesthetically pleasing (in fact, there were a few people I thought looked malnourished).

It might have been because of that context that I found the sight of Amaryllis to not actually be the most erotic thing I had ever seen in my life, instead taking a close second. The position of first is not
one that I intend to recount here, but it would suffice to say that I’d briefly had a girlfriend back on Earth, and she had been putting effort into seduction, even though she didn’t need to.

Amaryllis wasn’t trying to be sexy, or if she was, she was doing a really good job of pretending that she wasn’t. She waded into the water, pulling her hair into a tight bun as she did so, which brought her hands up over her head and showed off the muscles of her arms. She had dimples just above her butt and muscles visible along her ribs that tensed with her movements. If she’d really climbed up Sorian’s Castle it wasn’t a surprise that she was in amazing shape, but her curvature still spoke to softness and seduction. She looked back at me while she was doing up her hair with her fingers touching the back of her neck and it felt like my heart suddenly stopped when our eyes met, before it started again, pumping quite a bit faster. My breath caught in my throat.

(Look, I know you probably think that I’m a creep, because one of the classic creep things is reading some kind of sexual intent into things that weren’t intended to be sexual. Tiff was the only girl I had ever talked to at length about that sort of thing, and she’d said that one of the things that sucked most about the boy/girl dynamic was that boys, especially high school boys, would see a girl stretching out and they would not just look appreciatively at her tits, but they would also convince themselves that this was some kind of show specifically for them, or an unspoken overture toward something more. Really, sometimes she just needed to stretch out after sitting in a desk for an hour and a half. I tried to keep all that in mind as I watched Amaryllis, so I wouldn’t think that every little thing she did was some display for me.)

I went into the water until it was waist deep, then tried to wash myself clean and think about something other than the fact that Amaryllis was naked so close to me. That work became a lot more effective when Fenn handed me a bar of soap with a rope through it. Fenn herself had shed her towel as well, revealing her slender elvish body, and gave me a grin and a wink when my gaze momentarily slipped below her eyeline.

I’d just about gotten clean when the fighting started. My first awareness of it was my wrist being grabbed and pulled. I tried to yank back from it, but the grip was like iron, and when I turned to look at my assailant I realized it was Fenn, who was quite a lot stronger than she looked. She was making her way through the water and trying to drag me along as though I was the world’s dumbest man for not simply following her.

I saw the blood in the water shortly after that though, accompanied by screams and the movement of other people around us, which was all I needed in order to start moving as quickly as I could. I looked back to the center of the water to see a pitched battle of magics. I probably would have stopped to watch in awe if not for the pressure of Fenn’s hand around my wrist. All I had were impressions, of a naked man leaping high above the water and blasting red light through a crowd, of a naked woman riding a wave away from the action, and in one spot, a place where time seemed to be flowing backward. There were clothed people too, in among the bathers, armed with guns and swords, cutting through people.

We ran, Fenn at the lead holding my wrist with one hand and gripping Amaryllis’ hand with the other. We had stayed close to the edge and were among the first ones out of the water, in part because Fenn had started moving before there had been any sign of trouble.

“Grab your stuff, meet outside!” shouted Fenn, and with that she let go of my wrist, leaving me to run toward the changing room all on my own. When I got there though, I saw the attendant who had handed me my towel was dead on the ground, his throat slit, and three men with weapons were waiting there with hard looks in their eyes.

Without thinking about it too much, I cranked back my fist and put the entire force of my racing
pulse into it. The man I was going for apparently wasn’t expecting a naked man to attack him with blood magic, because his only reaction was a look of surprise before I shattered a number of bones in his face and what felt like half the bones in my hand.

**Critical hit!**

**New Affliction: Broken Bone!**

**Risen Bile member defeated!**

We collapsed to the floor together, me because I hadn’t been thinking about slowing down, and him because I’d apparently hit him hard enough to kill him. I felt a sharp bite in my ankle as I rose to my feet, but it hadn’t been the other two coming after me, only me cutting myself on the fallen sword. I picked it up with a wet left hand and turned to face the other two, but other people were slipping into the changing room now and the two of them were working against the throng of people, stabbing at them. In the distance, I heard the loud staccato claps of gunfire.

Now, you’re probably going to think that this is stupid, but I rushed those two men, naked, wet, injured, and using my off-hand. I might not have, if I hadn’t seen them kill a child. Maybe it was the jarring feeling of one moment trying to adapt to cultural views that made me uneasy and the next running for my life, or maybe it was the small part of me that wanted to right a wrong, but I swung my sword in at the side of one of them and though he was armored enough that I didn’t cut into him, I did force him to turn toward me while his friend held the doorway.

That was about as far as I had thought things through, if that. He came at me like a madman, screaming over the sounds of battle and swinging his sword like he meant to overpower me with his every strike. I parried and dodged, and by the third time I realized that he wasn’t actually a very good swordsman, and in fact, probably worse than I was. All he really had going for him was some leather armor and ferocity, plus the fact that he was using his main hand, and while I’d grant that counted for a lot, he was the first person I’d come across who I thought I might have been able to take in a fair fight.

I dodged another three slashing strikes, getting more sure of myself with each one and ignoring the messages that were coming up, until I found what I thought was an opening and lunged forward, aiming at his chest. Instead, I hit him right at the bottom of his throat, stabbing him through and losing my sword as he spun away from me in flailing panic.

**Risen Bile member defeated!**

That was when I ran, leaving my clothes in their cubby because I couldn’t spare the time to look through them all, down the hallways and out the front door of the bathhouse. I came out onto the streets of Barren Jewel, still fully nude and bleeding for my efforts. I stood there in the now-cool air breathing heavily and looking around. I was drawing some stares from people, but I was the first one out and no one seemed to be aware that something terrible was going on in there. I wanted to scream for help, but I didn’t know what I would say, and after a few seconds time I realized that getting questioned by the local equivalent of the police was exactly the opposite of what I needed.

I was saved from indecision when Fenn and Amaryllis came out of the bathhouse, both of them in their robes. Fenn took one look at me and let out a laugh, then threw me a towel she’d been holding.

“Come on,” she said. “Let’s get the fuck out of here.”

“Alright,” said Fenn when we were safely home and she’d checked that her bow was right where
she’d left it. “I think hiding that key in a tattoo was just about the smartest thing anyone has ever done.”

“What the hell happened there?” I asked, cradling my hand. I was sitting in a towel on the smaller of the two beds. My feet were disgusting from walking through the streets without shoes. I counted myself thankful to not have stepped on anything.

“Your guess is as good as mine,” said Fenn. “That was one of the crazier things I’ve seen in my life.”

“I think they had at least two goals,” said Amaryllis. “They were going after a few particular people, but they were also killing indiscriminately.” She shook her head. “At first I thought that it was directed against us.” She turned to Fenn. “We were very lucky.”

Fenn shrugged. “Or very unlucky, depending on how you figure it,” she replied.

I looked between the two of them. “Not to trouble the two of you, but I’m in quite a bit of pain here.” Gingerly moving a finger sent pain shooting up my arm. So far as I could tell, there was only a single broken bone in my hand, though it had felt like more when it happened. “I think another trip to the bone mage is probably in order.” My feet stunk from running in the street, and if the first trip to the bathhouse hadn’t been a disaster I probably would have suggested that we return there.

Fenn grimaced. “We don’t have unlimited funds. It wouldn’t be hard to find paying work to bring in some tcher, but that would take time. Besides, you’re the blood magic wunderkind, can’t you just heal yourself?”

“Possibly,” said Amaryllis. “He learned the fundamentals quickly.” She turned to me. “I never had any training in the healing side of blood magic, so you’ll have bear with me. If you pick it up as quickly as you picked everything else up, you should be able to mend that bone within about ten minutes.”

“Yeah,” I winced, “That would be great.”

“Alright, most of what physicians do, especially with broken bones --”

“Oh, we’re doing this little lesson now?” asked Fenn. “Because if we are, I’m going to go find some food. I don’t have a magical pick-up-powers-from-simple-descriptions brain, and I find lessons to be quite boring.”

“Bring us back something,” said Amaryllis. She rolled her shoulders and stretched. “I’m hoping that this won’t take long.”

When Fenn had gone, Amaryllis took a moment to look over my hand, making me hiss in pain a few times before she gently set it back down. A bruise had blossomed on it.

“Most of what physicians do, especially with broken bones, is to set things right such that the body can properly heal itself,” said Amaryllis. “That natural healing is what the lower levels of bone magic stimulate, as you’ve already experienced. For blood magic, I’m given to understand that it’s very similar. The blood in your body provides nutrients and oxygen, it clots your wounds, and it provides the basis for a whole host of other healing when you’re injured. So in a similar way to how you use the heat of your blood for Aarde’s Touch and the pulse of your blood for the Crimson Fist, you need to focus on the healing property of your blood. I … have never felt it myself, as I’m not a proper practitioner, and I don’t know the helpful analogies.”

“Okay,” I said slowly as I looked down at my hand. “Just … feel the healing. Promise you won’t be
upset with me if I get this right away?”

“Why would I be?” asked Amaryllis, but she seemed annoyed by the mere question.

“Nevermind,” I replied. I focused on my hand, and specifically on the broken bone, the bone that came down from my middle finger. (Metacarpal? That sounded a bit too much like a pokemon to be right.) I tried to think about my blood healing me, clotting the wound … doing whatever magical blood stuff it was supposed to do. I tried to think back on what it had felt like to have my broken arm heal back on Earth, but that had taken eight weeks and went too slow for me to notice anything except the itching of the cast and the dull throbbing of pain.

I was at it for about ten minutes, with no lessening of pain or skill pop-ups, before my attention began to drift, and it was another five minutes after that before I said anything.

“Is luck a real thing?” I asked.

“You’re supposed to be focusing on healing,” said Amaryllis. She narrowed her eyes. “You did this when you were supposed to be keeping watch too. Do you have attention problems?”

“No,” I said. “Not usually. I was just … thinking that it would be easier.”

“You thought it would take you less than fifteen minutes to learn something that takes multiple years of intensive study for others to learn?” asked Amaryllis.

“Well … yeah, kind of,” I replied. “I picked up blood magic and skin magic pretty quickly and I was under the impression that those should have taken multiple years of study each. In games there are sometimes gates to certain spells like attributes or skills. Normally I’d get a message, but this is pretty far from being normal. So the fact that I haven’t learned it quickly says to me that maybe it’s going to take a different approach.”

“You’re going to have to draw this ‘character sheet’ out for me,” said Amaryllis. “It’s probably better to have a physical version that we can manipulate and mark up.”

It was a little bit shocking to me how quickly I could go from trying to think unsexual thoughts about Amaryllis, to killing people who were basically a mystery to me, to feeling annoyed about Amaryllis taking ownership over my power. She was right; it probably did make sense to write things down, especially those things which weren’t obvious from just looking at the game layer itself, like what ability capped which skill. A message log seemed like it would really have come in handy, especially when other things were going on. But still, it was my weird game power thing, not hers, and I didn’t like or trust Amaryllis enough that I was ready to accept the “we’re in this together” thing with open arms.

“Define luck,” said Amaryllis.

“Um,” I replied. “I’m not sure that I can.”

“Elves are lucky,” said Amaryllis. “If you bet against them in a coin toss, you’ll lose nine times out of ten. If you try to shoot them, the bullets will miss more often than they should, though still within the realm of what’s strictly possible. Half of this comes from changes in the world around them that they have no obvious mechanism to meaningfully affect, while the other half comes from their own actions which they undertake for reasons which aren’t always clear to them.”

“Fenn began pulling us out of the bathhouse before anything had actually gone wrong,” I said.

“Yes,” Amaryllis replied. “She’s a half-elf, which I would assume would make her less lucky by any
of the standard metrics, but I’m not actually sure how or whether genetic dominance plays a part. Curiosity satisfied?”

“Why’d you ask me for a definition?” I asked.

“To see what you meant,” replied Amaryllis. “On Aerb there many people under delusions about how the world actually works, who think that there’s such a thing as luck which applies in all sorts of circumstances that it demonstrably does not. Gamblers will say that they’re rolling hot, or that the dice are due for a streak, or things like that, and though the Athenaeum of Mathematics and Metaphysics has done enough research to rule that out, these myths persist. The same goes for things like carrying around a frongal bone or spitting in a fountain.”

“We came to Barren Jewel today,” I replied. “The bathhouse we were in was attacked today. Is that just some horrible coincidence? Because that doesn’t exactly seem likely to me.”

“You’re saying that it was bad luck,” asked Amaryllis. “Not just bad luck, but an effect that someone could presumably measure?”

“I don’t know,” I replied. Really, I was thinking that it was the contrived sort of thing that would happen in a game, except for the fact that it didn’t appear to involve us in any way. In a game, the attackers would have been sent after us because of some cryptic prophecy, or because they had some way to track Amaryllis, therefore compelling us to action, or maybe it would be that Fenn was a mole feeding information to the enemy. But they hadn’t been after us, at least not noticeably, and we’d left without anyone monologuing at us or discovering some vital clue. It seemed too much like coincidence, but also too pointless, which was why I was thinking about my 0 LUK.

Fenn came back while I was in the midst of my second session of trying to heal my broken bone, which was now red and swollen. I was happy to cast aside the fruitless exercise in favor of some food. It was street food, a small, fried animal of some kind, wrapped in thin waxed paper. Fenn didn’t say exactly what it was, beyond “food” and I wasn’t inclined to press her on it.

“The bathhouse thing was apparently the work of a group called the Risen Bile,” said Fenn after she’d finished her portion of critter. “The city guard are out in force, but who knows what it is they’re going to do about it. Word on the street is that they have something up their butts about nubile women like Mary and I bathing in the sight of lustful men, I’m not sure I buy that though.”

“Mary?” I asked.

“We’ll need something to call her in public,” said Fenn. “It’s Amy, Mary, or Liss, and I picked the one that I like best.”

“I don’t really care what I’m called. No luck on the blood magic, by the way,” said Amaryllis.

“And that’s why I picked up some bones,” said Fenn with a smile, waving around a tiny little rib.

“There’s no one to teach him,” said Amaryllis. “And before you suggest it, we’re not going back to the bone mage in order to learn.” She looked at me. “You didn’t acquire bone magic in the time you were there, did you? I’d think that would be the sort of thing that you’d inform us of.”

“No,” I said. “But I didn’t acquire blood magic just from hearing about it, it was from the actual practice of it. Same with skin magic, kind of. Just seeing tattoos and knowing that they did things wasn’t enough, it was the feeling of a tattoo sliding over my skin. I think maybe if I had been more aware of it, I might have triggered the skill from the parachute tattoo. That’s just a theory though.” I took the bone from Fenn’s hand. “I guess now would be a fine time to test it.”
I tried doing what I had seen Magus Bormann do, holding the bone in one hand while concentrating on my injury. She had described it as pulling, but that word didn’t mean a lot to me. Maybe it would have if I could have felt some power in the bone, but it just felt like a greasy bone to me.

“What kind of animal was this?” I asked, hoping that I wouldn’t regret the answer. *Please don’t be rat, not after what we saw in the sewers.*

“It’s a gunzel,” said Fenn. “They keep them as pets in some places. Here in the Barren Jewel they’re really popular because they’ll eat up rotten manna.”

“Mana?” I asked. “Like magic?”

“Manna,” said Amaryllis. “Extend the ‘n’ sound. Also called Barren bread. I suppose we might as well teach you the words of power.” She held her hand out in front of her. “Besoneth.”

*Spell discovered: Alvion’s Flesh!*  

And there, without any ceremony or lightshow, a small loaf of bread appeared from nowhere and landed in her hand. “Terrible stuff. We won’t be eating it unless we don’t have a choice. The milk is more palatable. She held up her hand in a small fist just above her mouth. “Ilimoneth.”

*Spell discovered: Alvion’s Blood!*  

Milk poured down from Amaryllis’ fist, directly into her mouth. She swallowed it without pause, then coughed once and made a face.

“I’m surprised that a princess would have ever tried Barren milk,” said Fenn. For once, this wasn’t said as a joke or insult.

“I once thought it important to know what the poorest of the poor ate and drank,” said Amaryllis. “It’s helpful in the context of public policy to understand the reality of the people you’re governing. Barren milk and Barren bread are foundational foods for the poor, and even the middle classes sometimes use them to stretch their budgets.”

“So this gunzel,” I said, trying to get us back on track, “It traditionally eats leftover manna? Its life before becoming street food would have been as a scavenger in the city?”

“No,” said Fenn, blinking at me. “You think that would make any sense, for a vendor to rely on scavenger animals caught in traps or something like that? That’s daft. You’d make a horrible businessman.”

“So … farms?” I asked. “Someone keeps these creatures in a cage, says the spell to make them food and milk, and harvests them?” The image of a factory farm immediately came to mind.

“More or less,” said Fenn. “I’m not sure on the specifics myself, all I know is what I asked about. I didn’t think you would need the creature’s life story to get with the healing.”

I wasn’t sure that I did, but I tried to think about this creature as I turned the bone over in my hand. I tried to think about what life would be like for a gunzel, and failing that, I tried to think about what life was like for a chicken that was kept in a cage and fed the cheapest possible food in order to produce meat. Moments of fear as the rarely seen handlers came by, uncomfortable restrictions within the cage, a desire for freedom, perhaps, though maybe more than that just the will to keep on living and growing in spite of it all. Not even necessarily the mind, if gunzels or chickens had them, but the body’s efforts to turn slop into bone and muscle. That seemed like it was at the heart of END, the body’s perseverance, and that was what I was trying to pull on.
Unlocked skill: Bone Magic!

Achievement Unlocked: Sticks and Stones

Spell discovered: Physical Tapping

I felt the magic leave the bone, gone as soon as I’d grasped it, like a kiss on the wind. My broken bone didn’t feel any better, nor had I been able to perceive any change in myself. Yet I had felt the magic of the bone, just for an instant, and more importantly, the game had confirmed that I was on the right track.

“I’m going to need some more bones,” I said with a smile.
Skill increased: Bone Magic lvl 10!

Spell discovered: Power Tapping!

Spell discovered: Speed Tapping!

Spell discovered: Endurance Tapping!

Skill increased: Bone Magic lvl 12! (Skill capped at triple the value of primary stat KNO.)

Affliction: Broken Bone Removed!

It took me the better part of eight hours to cap out bone magic and fully heal my hand. Fenn left to go get more bones once it was clear that I was going to power through the hundreds available in the gunzels. Each bone was a pittance of power, even when I was pulling from it as hard as I could. Watching Bormann work made me think that it was less efficient to do it that way, so I tried to stick to teasing the power out of the bones as slow as possible, which gave an even smaller effect but over a longer period of time, which I suppose was meant to be a net gain in healing.

It wasn’t until I hit level 10 that I unlocked the ability to pull specifically endurance from the bone, rather than just all physical stats, and that helped me to speed up the healing process. It still took all of the bones I had available to me to get my finger fully healed, and it was still slightly bumpy afterward where the bone came back thicker. With another few hours and hundreds of the gunzel bones, I might have been able to get it entirely back to normal, but by the time I was finished both Fenn and Amaryllis had long gone to sleep. Fenn had gone first, unceremoniously stripping down to her underwear and claiming the big bed, while Amaryllis watched me work and kept me focused until an hour later when she was yawning so much it was a distraction. They shared the big bed together, and Fenn had one arm wrapped around Amaryllis’ waist, in what I was fairly sure was a subconscious attempt to bother her. That was when I finally changed out of my towel and into a set of clothes that Fenn had bought for me.

I kept on. I could feel the desire to sleep, but not the need. I wasn’t tired, but I was sure that I could have gone to sleep on the small bed within a handful of minutes if I had made the effort. I wasn’t exactly sure where Barren Jewel was in relation to Silmar City, nor whether they had a time difference, nor how much, but it was possible that I was experiencing some combination of jet lag and the magic powers of leveling up. Besides, I had taken a nap out in the sun.

It was nice to have some time alone to think. My mind kept going back to the bathhouse. There were a few things bothering me. First, Risen Bile was a terrible name, not the sort that you’d give to yourself unless you were a punk band or deliberately evil. Second, the rumors that Fenn had picked up said that they had done this terrorist attack because of some moral crusade, but we’d seen them targeting specific members. Third, the two men I’d fought had been weaker than I had expected, given the display of magic inside, which left me thinking that they were pawns or patsies. Fourth, I shouldn’t have been there. This was apparently a world where luck was a real, physical thing, and while I took Amaryllis to heart when she said that only elves had luck, I also knew that she didn’t know everything about my power, and my power said 0 LUK.

I tried to will a quest into existence in order to get more answers from the flavor text, but that predictably failed.
With some pencil and paper that Fenn had procured for me, I began writing down everything on my character sheet and then all the things that the game had told me and not recorded anywhere, with a special focus on the skill caps. I still had two points yet to spend and I was waffling on where I wanted to put them. The fact that Bone Magic had unlocked something on reaching a round number changed my thinking a little bit, since that made reaching those round numbers more valuable.

After I had filled a page with those observations, I began work on filling another page, this one with thoughts and questions about how the game tied into everything I’d created as a DM. I’d so far held off on asking about them, partly because I didn’t want to bother Amaryllis about unimportant things, and partly because there were questions that I didn’t want the answers to. I was feeling like I had put it off long enough though, and to be honest I was feeling a little bit more confident about this world’s ability to handle things, given the magics they apparently had at their disposal.

I was three-quarters down the page when Fenn woke up with a start, dislodging Amaryllis, who opened her eyes briefly and then readjusted herself to go back to sleep. Fenn stretched out and popped out of bed, still wearing very little clothing. She opened the window just a crack, enough that I could hear a very distant sound of gunshots, then shut it again. Had that been what woke her up? The sound of guns, too faint for me to hear while I was writing? I added a bit about the nature of elves to my list of questions.

“Whatcha writing?” Fenn asked as she moved over and peered down at my page.

“Put on some clothes,” I said. I was pretty sure that she was just standing next to me so skimpily dressed to provoke a reaction.

“Make me,” said Fenn. She reached forward, past me, and ran a finger down my list. “You’re listing exclusion zones?” Her finger stopped at Fel Seed. “Or just trying to make yourself feel bad?”

“He’s real,” I said slowly. “This world has a Fel Seed.”

“You don’t believe the legends?” asked Fenn. “Or wait, you have that broken brain that thinks it invented a lot of the details of this world from whole cloth. So you think that you thought up Fel Seed? In what context?”

“It’s a long story,” I replied. And not that pleasant of one. “Is he -- was he killed?”

“Nope,” said Fenn. “Still sitting on his throne in the City of a Thousand Brides. Not sure if that particular part of your brain survived your stroke, but he’s not someone we talk about in polite company.”

I shook my head. “He was built to consume the world. If he were in the process of doing that, or if he were killed, that would make sense, but … he’s still alive, doing his … work?”

Fenn patted me on the head. “You are a very strange hooman,” she said. “What is it you think an exclusion zone is?”

“Um, it’s like Chernobyl, which is a place on Earth where there was a horrible accident,” I said. That seemed like where the terminology would have been borrowed from, if I was designing this world, which in some sense it seemed like I was. “People who went into the heart of it would suffer from horrible cancerous growths and then die, or maybe just be killed outright by the poison there.”

“And the thing that keeps Chernobyl from spreading is the exclusion rule, right?” asked Fenn. She ran a hand over her ear. “The whole world would become a Chernobyl if not for that.”

“Um,” I said. “That’s … not really accurate to Chernobyl. I mean, there it’s something called a
nuclear weapon --"

“Ah, Blue Fields?” asked Fenn.

I paused with my mouth open. “There are nuclear weapons on this planet?” I asked.

“There were. But then they got excluded,” replied Fenn. “Gods, otherwise there probably wouldn’t be anything left of Aerb. You could still set one off in Blue Fields, if you really want to make that your life’s goal, but that seems a bit silly, even for a hooman.”

I was mind flooded for a moment by thinking about what that all meant. There were nuclear weapons, which seemed at the far end of the technology I’d seen present on Aerb, but they were somehow prevented from going off in … what, some kind of Dies the Fire type of scenario? Some change in the laws of the universe?

“So Fel Seed can’t spread,” I said slowly. “Because he’s … excluded. Somehow.”

“Yup,” said Fenn. “Just him, his captives, and his spawn, excluded from civilized society. Though we seem to be in something close to a civil war right now, so eh, clear houses, as you humans say.”

“Glass houses,” I corrected her. My eyes began to drift to her midriff and I looked down at the paper in front of me instead. “So you’re saying that most of these are exclusion zones. Places where there was a spreading sickness or evil that was stopped?”

“Sure,” said Fenn, leaning over me. Her arm was next to me as she pointed at the paper, and I glanced briefly at the curling pattern of scars there. I shut down the urge to ask if I could touch them. “Fel Seed, Nightsmoke, yes, Parsmont, yes, City of Lasting Blood, technically yes, Glassy Fields, a big yes … but you’ve got things like the white spires here, which are benign, a few I don’t recognize, like this ‘Teeth City’, and it’s kind of a jumble.”

“How many of these exclusion zones are there?” I asked.

“Fifty-three,” came an answer from the bed. Amaryllis swung her feet off the bed and blinked a few times before standing up and looking down at her rumpled clothes in distaste. “Hand healed?” she asked me.

“Yeah,” I said. “Fifty-three?”

“By a conservative count, yes,” said Amaryllis. “I won’t bore you with the imperial politics of it all. And since we’re all up, we have other things that need doing, like preparing for Caer Laga. Fenn, I would appreciate it if you put some clothes on.”

Fenn pouted, but began slipping her pants and shirt back on. I was certain that it wasn’t by accident that she was pointing her butt in my direction as she did so. I caught a frown from Amaryllis at that, but tried my best not to read too much into it.

“First things first,” said Amaryllis once we were all clothed. “I think that we should train up Joon.”

If this were a movie, here is where we would have a montage.

After Amaryllis looked at my handwritten character sheet, she asked me for specifics on what kinds of things had made those skills go up in the past. I moved ahead of her in the conversation a little bit by suggesting exercises I thought would work well to raise those skills in the controlled environment of our hotel room, and after some discussion of what was most important, with general agreement
that a focus on combat was best, I spent about a week maxing out all my skills except for pistols and rifles, neither of which could be done without making a racket, and horticulture, which I didn’t have an easy way to increase.

I learned the skill Bows from simply touching Fenn’s bow, but she wouldn’t let me shoot it and ended up spending a fair sum on a bow that I shot at targets across the room. That was only enough to count once I had some very small targets to aim at; until it was a challenge, the game wouldn’t give me anything for it.

There were a few interesting things that I learned about the game in the process though.

*Skill increased: Parry lvl 10! (Skill capped at five times the value of secondary stat INS.)*

*New Virtue: Nascent Blade-Bound!*

First, getting to level 10 in a skill *did* occasionally unlock something, though it was inconsistent. Second, skills were capped at either three times the primary stat, or five times the secondary stat, which put an additional restriction on how high skills could go and made the social skills more important than I thought they would be.

I got a few more virtues along the way, but they were incredibly minor effects when I looked them up on the ‘Virtues’ screen. Unarmed Combat 10 gave me the virtue “Hardened Knuckles” that lessened the toll unarmed combat would take on me (no numbers, just that flat statement). Dual Wield 10 gave me Ambidexterity, the uneasy feeling of being equally adept at using either hand for a task and removing all preference (which I immediately tested by writing; it was unnerving to sign my name left-handed). Thrown Weapons 10 gave me “Range Finder”, the ability to more easily determine how far away something was. Improvised Weapons 10 gave me “Structural Assessment”, the ability to hold and wield improvised weapons in such a way that they would break less easily, though never outside the bounds of reason.

Like I said, it was nothing that left me in awe, just very minor benefits. If you could have bottled any one of those, you could have sold them for a mint, especially Ambidexterity, but I wasn’t convinced that they would ever make the difference between life and death.

The most awkward were probably the social skills.

“Alright,” said Fenn, rubbing her hands. “Flatter me.”

“Um,” I said. “I don’t actually think this is all that necessary. We’re going to an abandoned castle and fighting some mindless creatures along the way, right?”

“Thaum-suckers aren’t mindless,” said Fenn. “They’ve got a cunning to them, makes them dangerous. But no, they’re probably not going to be swayed by telling them what beautiful blue eyes they have. Me, on the other hand, I’d be more amenable.”

“Your eyes are green,” I said.

“Your eyes are …” I hesitated, choosing my words. “I could get lost in the beauty of your eyes, the way they seem luminous in the morning light, and when I see you smile, and that smile touches those elegant eyes, my breath catches in my throat and my heart hammers in my chest.”

*Skill increased: Romance lvl 3!*
“Alright,” I sighed, “That worked.”

“Hooray!” said Fenn. She bit her lip. “Now flatter my, hrnm, … tongue.” She stuck out her tongue. “Ad do i’ igh.”

So that was all very silly and awkward, but it thankfully didn’t go on very long because my social skills were capped at 6. Romance was the worst, partly because I couldn’t see myself ever using that skill, and partly because Fenn seemed to like being a flirt. I couldn’t tell whether she had any actual interest in me or whether she was just having fun at my expense, or maybe both. Either way, I wasn’t about to act on it or do anything but be flustered. Still, practicing Romance and Flattery with Fenn was preferable to doing it with Amaryllis.

Other than that? I’m not sure what to say. It was a week of my life, lived mostly in a hotel room because there were recurring bouts of violence on the streets and Amaryllis -- Mary, now -- didn’t think it was smart of me to go out when I was so ignorant of the world.

They did try to remove some of that ignorance, but they were trying to haphazardly cram a lifetime of knowledge into me, and it was mixed in with things that I remembered from D&D, which made me misremember things with some frequency. There were also too many things for me to ask about and too many things that they would both assume were the same between our worlds.

**Common Knowledge About Aerb**

1. Aerb was about ten times larger than Earth, flat instead of a sphere, and shaped like a hexagon. If you went far enough north, you would end up in the south, and it was the same in any direction. (Amaryllis gave me a measurement for Aerb and I had to approximate Earth’s size given that I could only remember how wide the continental United States was.)

2. Aerb had no time zones, because the sun was in the same apparent position no matter where on Aerb you were, with no parallax. Despite that, there were still seasons, because the sun got smaller in the winter and larger in the summer. There were also regional variations in temperature caused by something called the projection layer, a super-atmospheric phenomenon that Fenn was ignorant of and Amaryllis didn’t know too much about.

3. There were roughly 200 “mortal species”, plus the Animalia, which were anthropomorphic animals like Quills. There had been five distinct waves of elven migration from Celestar, each of which was considered a different species. There were dwarves, but they mostly kept to themselves, underground. There weren’t “evil” species per se, but there were evil cultures made up exclusively of one type of species, which Amaryllis seemed to think was an important distinction and Fenn rolled her eyes at.

4. There were twenty-two different kinds of magic, and that was the conservative count. Many of those only included in the less-conservative count were hereditary, racial, or otherwise not the sort of thing that was available to just anyone. Looking at my character sheet and assuming it was laid out in a sane way, I would have access to at most fifteen of them, though probably less. (I was extremely interested in learning more of them, but Amaryllis thought that all the low-hanging fruit had already been picked. That didn't stop me from asking questions, but she was right that there were significant barriers that it didn't seem like my ability to learn things really quickly would overcome, or which would be useless to us without the necessary resources to capitalize on them.)

5. When people said “the empire” they meant something akin to the United Nations, in that it was a rather toothless organization whose real power came from member countries agreeing to impose standardized laws or make global (they said hexal, for obvious reasons) sanctions against one another. The proper title was “The Empire of Common Cause”, but people just
called it “the empire” or “The Third Empire” if they were being snarky, for historical reasons that I don’t think are too important.

“Okay,” I said after one of these infodump sessions. “But there’s one thing that I don’t really get.”

“Just one thing out of literally everything in the entire world?” asked Fenn. She was getting annoyed with the whole dream-skewered thing, I could tell, just like she’d predicted she would be.

“So, forge frenzy is distributed fairly randomly and on a per capita basis, right?” I asked. Amaryllis nodded. “Well, what I don’t really understand is how the Lost King and Anglecynn still have so much power, unless they’ve been hoarding entads and heirlooms created in Anglecynn or brought in from elsewhere. But if that’s the case, then I wouldn’t expect the most direct descendant to have much in the way of any particular power.”

“And why do you think that?” asked Amaryllis. “Why shouldn’t power acquired retain its value? It would dilute, because succession of heirlooms follows different rules, but I’m not sure what you’re getting at.”

“Okay,” I said, “Well more magic items are being created every year --”

“Why?” asked Amaryllis.

“Because … there are more artisans over time?” I asked. “Unless this is a mechanization issue?”

“Why would there be more artisans over time?” asked Amaryllis, using her patient voice. She was getting annoyed with the dream-skewered thing too, but she dealt with it much better.

“Every year there are more people than the last,” I said, just before realizing that wasn’t necessarily true on Aerb. “Okay, explain this to me, is global population going up or holding steady?”

“During the reign of Uther Penndraig, five hundred years ago, the hexal population was twenty billion,” said Amaryllis. “Today it’s five billion.”

“Seems to me that people need to start fucking more,” said Fenn. “At least, I heard that was how babies were made.”

“Sex doesn’t help if people use prophylaxis,” said Amaryllis. “And it’s a complicated issue even beyond the question of whether the replacement rate is high enough. The exclusion zones are a problem that keeps getting worse and there are singular events which cause dips in the world population that we never recover from.”

“Aerb is dying,” I said.

“Well that’s a leap,” said Fenn. “Celestar, now there’s a place that died, if you need context for world death.”

“It’s not clear whether it’s dying or not,” said Amaryllis. “The overall trend is downward. Optimists feel that the final graph will be sigmoid, with a long period of stability before the First Empire, a period of instability, and then a second long period of stability.”

We moved on to other things after that, but it left me thinking holy shit is this world grimdark. There was no heaven, only nine thousand hells, and Aerb itself was becoming a shadow of itself. It was obvious to me that this was a reflection of my own mind; since Arthur had died, I hadn’t really been a believer in bright and happy futures, and even before then I had always made my worlds a little dim so that the heroes could shine all the brighter. That was the thought that gave me hope. If I had
designed this world, then maybe I was a hero in it, one of the people whose purpose was to blaze with light and banish the darkness.

Fenn and Amaryllis did most of the other preparations, moving through the city to gather supplies when the fighting calmed down a little bit. There were still periodic bursts of gunfire, audible when the window was open, and the occasional metallic smell of blood in the air. Whoever the Risen Bile were, they were being slaughtered by the city guard. The word from Fenn was that the guard was being a little bit overzealous, which caused civilian casualties that no one was happy about. Between that and the looting that followed some of these attacks, the city wasn’t a great place to be. Perhaps if the tattoo Amaryllis wore wasn’t single use, she would have pulled it out and we would have made our preparations elsewhere, but I almost got the feeling that the instability was to our benefit.

We filled our packs with food and water for the trip. Fenn bought (or perhaps stole) a sword for me, along with a void rifle I discovered to my surprise was the same one I’d left outside the wall a week ago; she had recovered it for me. Fenn filled her quiver with arrows and acquired a new dagger to sit on her hip, replacing the one she’d stabbed Leonold with. I wasn’t sure how much of what we had was stolen by Fenn and how much had been legitimately bought, but it didn’t really seem to matter. On the night before we left, she came into our room and unloaded a sack full of bones for me to pull from, and I was certain that she hadn’t come by them honestly.

And then, just like that, we climbed over the wall and set out for Caer Laga.
We traveled across the desert together, trudging through the sand in our white robes, moving single file to hide our numbers so that one person could play trailblazer, a duty we rotated. It had been explained to me that magic in the general sense could be divided up into three categories: latent, passive, and active. Thaum-seekers (or thaum-suckers, depending on which of my party members I asked) could sense out and hunt down both passive and active magic at incredible range, but latent magic was mostly safe from them unless they were right on top of us.

Fenn’s bow was latent magic, unless she used its special ability, in which case the thaum-seekers would probably see it like a lighthouse on the horizon. Similarly, Amaryllis wore a magical tattoo on her arm concealing the teleportation key, which would remain as latent magic until she pulled it off and took the teleportation key out. And void crystals were “mundane” though every bone in my body was telling me that they were basically witchcraft.

That left me and the not-inconsiderable magical power that I was carrying around. I had a pack of bones, but was not to use them unless we got into combat. I had the blood flowing through my veins, but wasn’t supposed to even think about tapping into it unless it was a very serious emergency. Skin magic I couldn’t really use, because we hadn’t had any money left over for tattoos. That left all of the weird game character stuff that was unique to me, which we weren’t sure would count as magic at all. It was something we’d want to learn sooner rather than later, because if the thaum-seekers were drawn to me then we’d want to know before we were too far away from the safety of Barren Jewel, when we could still bail out on our trip to Caer Laga.

“It’s confusing to me that you even make a distinction between magic and not magic,” I said as we ate our first meal of the trip, something called portable soup, which reminded me a lot of ramen, minus the noodles. “On Earth we say magic when we mean something mysterious or supernatural, but blood magic seems like it’s got a major university dedicated to its study.”

“Never call an athenaeum a university,” said Amaryllis.

“Rule number 137 for surviving life on Aerb,” said Fenn. She wasn’t actually keeping track of the rules Amaryllis was giving to me, but the numbers did go up each time, and I had a sense that she would be surreptitiously thinking up clever ways to stretch the joke in the future.

“Oh,” I said. “But it seems to me like so-called ‘magic’ has been studied until it’s lost any sense of the supernatural and all mystery has been drained from it. I mean, there’s some wonder left in it for me, because the athenaeums are closed to me and for now it’s not safe for me to have even a disreputable teacher, but that’s not the case for the population at large. There are corner stores that will etch you with ‘magical’ tattoos.”

“What word would you have us use?” asked Amaryllis.

“I don’t know,” I replied. “It’s just something I was thinking about.”

Fenn sat down and began slurping from her own bowl of soup, which she’d been letting steep. “Well I personally was thinking about the thaum-suckers racing across the desert to claw our eyes out,” said Fenn. “I think we’re clean though, and we should be well beyond the range of Alvion’s Word, so we can keep moving as soon as we’ve finished.”

So we walked through the desert, packs on our backs slowly lightening as we ate and drank our way through our reserves. Every time I drank water, I was glad that I was one pee stop closer to carrying
less around. While we were back in our hotel, I had this great idea for adapting the Tsiolkovsky rocket equation to desert travel; it takes a certain amount of water to travel a certain distance, but carrying that water means you travel slower and use more water, so you need more water to get further, and that has to be added into your calculations. Eventually, you run into the tyranny of the desert equation. (I didn’t actually remember the rocket equation, so might be badly mangling that; I was a hard fantasy geek, not a space geek.) We were only going about fifty miles, plus some leeway, broken down into about five days of going ten miles across the sand dunes and past rocky outcroppings, one gallon a day, with a gallon weighing eight pounds, meant forty pounds of weight in water alone, plus a sword, plus a rifle, plus food, plus clothing, plus bones.

“I should have built a wind sail,” Amaryllis grumbled at the end of our first day.

“Oh?” asked Fenn. “I’m pretty sure that would have the same problem as my idea of taking some voetsa out to ride on, which is that we’d need to get them over the walls. Also, I’m not sure what winds you’d be planning to harness, because this air is practically unmoving.”

“Still,” said Amaryllis.

“On the bright side, we still haven’t seen any of the thaum-seekers, right?” I asked. “If we can make it to Caer Laga without running into one or having an incident, then we’re basically home free, right?”

“I don’t think we’re that lucky,” said Fenn. “But … maybe we could be?”

I had two ability points floating, yet to be spent on anything. As soon as Fenn knew that LUK was a thing, she’d wanted me to dump those points into it. Amaryllis thought that I should choose a primary and secondary attribute, whichever ones were tied to the most valuable skill, and ditch the bonus from putting the points into the three general abilities. I didn’t quite welcome the advice from either of them. I was still holding onto those two points, partly because I was suffering from decision paralysis and partly because I was hoping that the game would reveal some One True Path to me. There were still skills that I hadn’t uncovered yet; I didn’t want to commit only to find out that I’d given up on something amazing.

I let Fenn’s comment pass by without responding to it, and we slept in the surprisingly cold desert. I wasn’t surprised that the desert would be cold at night, since there wasn’t any foliage or moist air to keep the heat in, and anyway I knew that deserts tended to be cold at night. Still, even knowing all that and taking it into account, I was surprised by the cold.

Walk, walk, stop, eat, drink, walk, walk, rest. Fenn started the trip with a large volume of chatter, but by the middle of the second day she was mostly silent, focusing her efforts on putting one foot in front of the other. Amaryllis was much better at pacing herself.

And for me? I didn’t find it easy, but one of the neat things about my peculiar power was that training Athletics to 15 by lifting makeshift weights in our hotel room for hours on end made me well-suited for a trek across the desert, even though I was pretty damned sure that the muscle groups weren’t related. I almost offered to take some water or equipment from one of the girls, but decided against it because the last thing I wanted was to misjudge my abilities and fall down like an idiot three days in after being too chivalrous.

We walked during the day and slept during the night. There were arguments for doing it the other way around, but the temperature didn’t climb terribly high during the day, and visibility was low during the night. Our biggest concern was the thaum-seekers, not the heat or a lack of water, and on balance we’d decided that it was better to stay in one spot at night with someone keeping watch than to bumble around in the dark making noise. The thaum-seekers would pour on speed to get at active
magic, and would track passive magic from miles away, but I was assured that if they came across latent magic they wouldn’t hesitate to go for the kill. In this world that meant anyone with skin, bones, or blood, and we happened to have all three.

Contrary to what Amaryllis had said, I didn’t have attention problems, but I hated keeping watch with a burning passion. Back on Earth I had been something of a daydreamer, and years of schooling had made me very adept at zoning out and thinking about other things. Trying to keep aware and alert was hard enough, but the real kicker was that my thoughts kept turning toward things that I didn’t want to think about when I was left alone with myself, same as they had for the last nine months on Earth.

Tiff’s room was on the second floor of her house, with a window that overlooked the roof of their back porch. The first time I’d come over to her place she’d popped out the screen and led me onto the roof to look at the stars with her.

(Tiff always felt like she had moved to town around the middle of high school, but that wasn’t actually true. She’d grown up in Bumblefuck, Kansas, same as the rest of us, it was just that she lived out in the country and she had mostly kept to herself, cloistered within her own group of friends. That group of girls had collapsed at some point freshman year, first with Laurel, a keystone member, moving away, and then with two of the girls dating boys a few grades ahead of us. Tiff was adrift for a few months, until she fell in with us. Her alternate trajectory into our D&D group always left me feeling like she hadn’t actually been in Bumblefuck until sometime before that first session with us. Whenever I was reminded that she had been there all along, it felt like a sloppy retcon, because how could I have not been aware of her?)

We sat on the roof of her porch, where she’d laid out a blanket for us. I was on my back, looking at the stars, trying to remember some of the constellations we’d made up together but not able to focus. She was curled up beside me in one of her father’s sweaters, three sizes too big for her so it covered her hands in the cold night. Her head laid on my chest, rising and falling with my breathing. She’d been crying earlier, but had mostly stopped, her shaky breath returning to normal. It was a month after Arthur had died.

“I’m worried about you,” she said in a small voice.

“Oh?” I asked.

She lifted up a hand that had been wrapped around me and poked me in the chest. “You’re hurting.”

I did as much of a shrug as I could without dislodging her. “He was my best friend,” I said. “It’s supposed to hurt. I’d have to be pretty fucking sociopathic to feel nothing.”

“I worry that you,” she stopped and bit her lip, “I worry there’s a part of you that’s sinking into it. It’s … well, my uncle, he has a CCW license, and the way he talks about maybe having to use it one day it’s like you know that he’s just high on this fantasy of getting to shoot someone to death.”

“You think I wanted Arthur to,” die, but I couldn’t get the word out. The words were coming out monotone anyway, devoid of the anger that I should have been putting behind them.

“No,” said Tiff. “No, no no no, it’s, the thing I’m trying to say is that it’s like you’re waiting to show people how much you’re hurt. And I get that. I want to scream at them too, to ask how they can just keep carrying on when he’s,” dead, she couldn’t say it either, “gone. And I know that I was this, interloper, I wasn’t his best friend, I know it’s harder for you.” She was quiet for a while as she blinked back a fresh round of tears. “I’m worried that you’re hurting, and there’s something alluring
about the pain, because it’s a righteous, meaningful pain. I,” another sigh and a deep, steadying breath, “don’t want you to keep going down this dark path.”

“You think you understand me better than you do,” I told her.

She was silent for a long moment. “Maybe,” she said softly. “I’m trying though. I know there’s this void that can’t be filled. I know that. It’s the same for me --”

“It’s not the same,” I said, almost by reflex.

She was quiet again, until she started crying, but it was quiet, soft crying, not wracking sobs this time. I looked up at the stars, but couldn’t see them because I was blinking back tears. I didn’t mean to make her feel bad. I couldn’t hold back though, I couldn’t tell her the lies that she wanted to hear. She wanted me to say that I missed Arthur, but at least we could still take comfort in each other. I couldn’t say it though, because at the time I didn’t think it was true.

Tiff missed the next D&D session because of a doctor’s appointment, then the one after that because of a family thing, and then she stopped giving excuses and just didn’t show up, which was probably for the best given how those sessions went.

So my cold nights in the desert were pretty miserable, because they were doing a great job of calling up all these unpleasant memories. Maybe it was the isolation, the desolation, or the cold, or maybe it was Celestar hanging in the multi-colored sky and reminding me that sometimes things got ruined and could never be fixed.

Days were better, partly because I had company and partly because walking got me into a sort of zen state where time passed quickly. We navigated by the sun, or rather, Fenn did, and it was Amaryllis who did most of our pace-setting. That left me content to stare off into the distance, white robe shielding my eyes, looking at nothing.

We spotted Caer Laga on day four. The desert wasn’t totally featureless, it just didn’t have any plants, water, soil, or buildings to speak of. That left sand and rocks. It was atop one of these rocky bits that Caer Laga had been built, with the base of it starting some hundred feet up and no clear path up the cliff face. It was a rounded fortress with no battlements or crenellations and a circular sloped roof covering the entire thing. There were windows, but they were small and defensible. We were still a day away from it, but at least our objective was in sight.

Amaryllis suffered a fall not long after that. We were walking along a rocky ridge that one of the dunes was butted up against, hoping to spare ourselves an arduous climb up a second dune or having to take a longer path. One moment I was in my partial daze, the next I was watching her roll down the dune.

"Fuck," muttered Fenn, who followed her down, skidding along the sand. I squared my pack and did the same, trying desperately to keep my balance.

"Are you okay?" I asked as soon as Amaryllis came to a stop. She was pinned down by her pack, clearly breathing but not moving.

"Ankle," she said. "Hurts."

"Well, that’s not how I thought this particular adventure would end," said Fenn. "I thought it would be more of a claws and teeth type of thing."

"Help me up," said Amaryllis. We did, with me doing most of the work, first pulling her pack off her
and then moving her so that she was laying with her back against the sloped sand. “I’m not sure this is it for us.”

“Like hells,” said Fenn. “We can’t risk having Joon heal you and it’s another eight miles to Caer Laga, which seems like it’s going to involve quite the climb.”

“Six miles,” said Amaryllis. “We have options. We can outrun the thaum-seekers. Or we can fight some and outrun others. We’re close.”

“Or,” said Fenn. “You can pull the key from your arm, we can go back to the Barren Jewel, and we can be luxuriating in creature comforts within the hour, then back here as soon as the two hour timer is up.”

“Where the thaum-seekers will surely be waiting for us,” said Amaryllis. None of this conversation was all that new to us, since we’d gone over exit strategies before stepping foot into the desert. We still had the room rented in Barren Jewel, with a section carefully marked out on the floor where we would teleport in and explicit instructions that nothing was to be disturbed.

“Can you walk?” I asked.

Amaryllis temporarily put some weight on her foot and then abruptly fell back down with a sharp gasp of pain. “No, I don’t think so.”

“Okay,” I said. “My vote is for dragging Mary to the cliff and healing her there, then climbing up out of the range of the thaum-seekers before they reach us.”

“How long will it take you to heal her?” asked Fenn. “Your hand took eight hours. We’re not going to have that kind of time.”

“I wasn’t as good then, and I had worse bones,” I replied. “It won’t be eight hours. That said … I don’t know. I’m still pretty new at bone magic.” And the game was still being stingy with giving me raw numbers. “I still think moving to the cliff is the right idea. We’re through most of our food and water already, I can transfer everything in Mary’s pack to mine, and we can fashion hers into a sled to pull her there.”

Fenn clacked her teeth. “We planned for five days, we were making fine time, now we’re going to be slowed down some, but … if we didn’t have our get-out-of-jail-free card, or if I were expected to do extra work, I would probably object more strenuously. Fine. Let’s do it.”

The whole thing was a little easier said than done, partly because Amaryllis was clearly in pain and I didn’t want to jostle her, and partly because she kept wanting to help, especially with the sled that we were making. It was clear that one of Amaryllis’ specialties was engineering, but having her direct me was a bit maddening.

Skill unlocked: Engineering!

That took some edge off the irritation though.

Five hours later, we saw our first thaum-seeker. It was sitting at the top of a hill, peering off into the distance, but not in our direction. From a distance I could only barely make out its red dog-like form. I had been given a description though, of terrible claws, teeth that extended well beyond its lips, and wide nostrils that dominated its face. I thought maybe I could see its teeth, but not much else.

“Frick,” said Fenn.
We moved down a slope and out of its line of sight, then stuck to the valleys after that. With the heavy packs and careful navigation we had to do, as well as the effort expended in taking circuitous routes or going up and down dunes, we’d been making about a mile an hour through most of the trip. With me pulling Amaryllis, it was going a lot slower. I was worn out from four days of travel, and I was also pulling a hundred and twenty pounds of princess, plus everything that had remained in her pack. By the end of the day, she was muttering a swear with every bump and shift in weight, and we were still about two miles away.

“What do you want to do?” I asked when we stopped for a break. I made a bowl of portable soup for her with a side of pemmican. Her face was sweaty. The ankle was badly swollen, and I noticed with distress that her right hand had gotten a lot worse since we’d been to the bone magus. The nails were thicker than they had been, almost completely yellow, and cracked down the middle, where they wept a clear fluid. That I hadn’t seen them before said to me that she’d been hiding them from us.

“Continue on,” said Amaryllis. “We’re not far.”

Fenn looked at me with a raised eyebrow. I saw her mouth the words ‘voting bloc’. This was really not the time for us to have a discussion about where loyalties lay, nor for me to be swayed by the desire to get in anyone’s good graces. I surreptitiously flipped her a middle finger, which she smiled at.

“We have an unanticipated climb ahead of us,” I said. “I know we brought pitons and rope, and I know that you’re a fantastic climber, but I worry that I’ll be suffering from exhaustion by the time we get there. Even if I can heal you, it’s too dicey, and we’d be trying to make the climb at night. I think we should teleport out. We can recuperate in Barren Jewel, and if they’re attracted to the scent of the teleport, we can wait them out a bit, then come back in and fight them off while making our way to Caer Laga.”

Amaryllis sighed. “Fine.” She reached over and touched her tattoo. “Fenn, I don’t suppose you’ve changed your mind?”

“As amusing as it might be to leave Joon twisting in the wind on this one, no, I haven’t,” replied Fenn. “Let’s get the hells out of here.”

Amaryllis reached for the edge of the tattoo with her cracked yellow nails, digging in slightly, wincing in pain, and pulling at the skin. I expected the tattoo to animate or move, with something similar to what I’d seen happen when Leonold pull rope from his arm. Instead, we just sat there while Amaryllis narrowed her eyebrows and tried to dig her broken nails into the tattoo to no effect.

“It’s not working,” she finally said.

“Well are you doing it right?” asked Fenn.

“This isn’t my first time using a tattoo,” said Amaryllis with a frosty voice. “It’s the tattoo that’s not working.”

“Because of the rat rot?” I asked.

Amaryllis curled her hand into a fist, hiding the nails. “I don’t think so,” she said. Nevertheless, she tried to awkwardly curl her left hand in and touch her tattoo with her healthy fingers. Still nothing happened.

“If you’re fucking this up on purpose,” Fenn began.

“I’m not,” said Amaryllis. Her face was flushed. “What would the endgame be? I could pretend the
tattoo wasn’t working now in order to get my way, if I was the petulant child you think I am, but what would I do when we’d gotten to the cliffs, or once we were inside Caer Laga? If I were a sociopath you should trust that I’d be the kind that looks to the future and doesn’t get caught in obvious lies. It’s not working.”

“So,” I said carefully. “That would seem to be a problem, since we’re forty-some miles from Barren Jewel and have, conservatively, a day’s worth of food and water left.”

**Quest Accepted: Exit Strategy - You are stranded in the desert with limited food and water, no access to magic unless you want to risk being gutted by feral thaum-seekers, and a wounded party member. Hope you prepared carefully!**

“Um,” I said. “I just got a quest. The gist of it is that things aren’t looking great. Quest completion is probably getting out of the desert. It said … it said that it hopes I prepared carefully.”

“We did prepare carefully,” replied Amaryllis. “We should get going.”

“Shit,” said Fenn. “To Caer Laga? You said yourself that there’d be no reason to suspect that you’d be able to extract the key there if you can’t pull it here. From everything you’ve said, this place was shut down and left waiting more than a hundred years ago, which means there’s not going to be any food or water there either. Even if we heal you, scale the cliff, and get inside, what does that get us?”

“Heirlooms,” said Amaryllis.

“Wait,” said Fenn, squinting slightly. “The armor, a sword for you, a sword for Joon, the box, the gloves for me, the amulet, the jar for us, … you said the jar had healing properties?”

Amaryllis nodded. “If I’m right, and it’s there, and I can bind to it, then yes.”

“And you think that this healing will prevent us from starving?” I asked.

Amaryllis frowned. “I don’t know. But … I think it doesn’t matter. Our options at the moment are to try returning to Barren Jewel on quarter rations of food and water, or forging on ahead and hoping that we can find some salvation. On balance, forging ahead gives better odds.”

Maybe I should backtrack a little bit here and give you some history, which might help to clear up some mysteries. (If you’re one of those “blah, blah, blah, history” people, I’ll meet you at the next linebreak.)

**Mystery #1:** How is Amaryllis the most direct descendant of Uther Penndraig, if she’s about as old as a senior in high school and there are thousands of Penndraig princes and princesses? Well, you probably figured this one out for yourself; generations don’t always progress at the same rates. It had been roughly five hundred years since Uther Penndraig had left his two fully grown sons to go off on some presumably ill-fated quest, leaving behind what I’d slowly come to understand was an **incredibly** vast armory of magic. Amaryllis was ten generations removed from him, which came out to be something like fifty years per generation.

From that you can probably guess what her family line looks like; it was mostly men carrying the name and they were both long-lived by human standards and having children really, really late in life. This wasn’t just happenstance, not after the fourth generation, it was a specific reproductive strategy aimed at creating a solid family line that could take advantage of specific family heirlooms once held by Uther Penndraig. As previously stated, magical heirlooms followed succession rules, but these differed from heirloom to heirloom.
Amaryllis’ line was favored by any succession rule that favored brothers or sisters over sons or daughters, and by any succession rule that favored older generations over newer ones, and any succession rule that split things equally among a generation. That meant a lot of magical power resting in the hands of a single young person.

“But what of her mother and father?” you might ask. Well, her father had been eighty-two when she was born, and died when she was two years old. Her mother became a power in her own right, because some heirloom successions favored husbands and wives over children, but she died (in what was likely an assassination) when Amaryllis was ten years old. Most of this I learned from Fenn, who had done a fair amount of asking around because she was an intolerable snoop.

Anyway that brings us to ...

**Mystery #2:** Why couldn’t we just teleport into the fortress, get the items, and then get out? That had been my first question, since not being able to do that seemed like dumb videogame logic to me. The answer was that the teleportation key only allowed you to go to one of the touchstones (which I thought of as magic homing beacons) or to a place that you’d already been, and Amaryllis had never been to Caer Laga. Her father and/or mother probably would have taken her to get it in her memory, but they’d both died when she was young.

But that raised another question, which was ...

**Mystery #3:** Assuming that Caer Laga was gracefully shuttered in full working order, why were there any magic items left behind? And the answer to this one turned out to go fairly deep. See, Caer Laga was in the middle of construction right when the blight began spreading over what later became the Datura Desert. They had time to finish the fortification and lay some powerful warding magic into the stones of the place. A redoubt in the middle of a wasteland where there are no resources to extract or choke points to defend might seem like a pretty crappy and pointless thing to build, until you remember that in the Lost King’s Court, assassination wasn’t exactly out of place. A redoubt in the middle of an exclusion zone is actually a really great place to lie low if you’re under attack, doubly so because if you’ve been there you can teleport in with a teleportation key, and if you haven’t been there you’re stuck -- well, basically doing what we were doing, but probably with better resources and a bigger team.

And naturally if you have a ton of magic items and most of them only work on you or your closest allies, you’d keep some back at your super secret fortress that you have set aside for when things go to shit. The exact details of these magic items hadn’t been written down, probably for reasons of operational security, with the thought that these details would be told to Amaryllis in person. They weren’t, because Amaryllis’ life had apparently been written by Lemony Snicket.

(The small part of me that had initially scoffed at the adventure as being plainly a stereotypical adventure was mostly placated by all this, but I was still trying to find some cracks in the world, some place where the myriad rules and facts didn’t quite line up with what I observed.)

We forged on ahead, even as darkness fell over the desert. I dragged Amaryllis, trying to keep her steady but sometimes failing to a grunt or gasp of pain. Fenn went a little bit ahead, making sure that the way we were going was clear. By the time we reached the cliff another three hours later, I was exhausted and aching. It would have been a great time to suck the power from a bone to reinvigorate myself, and an even better time to level up.

“So,” said Fenn. “Thaum-suckers don’t have shit on us.”

“We should plan out a route up the cliff face,” said Amaryllis. “It doesn’t look too difficult to me.
Joon, if you could get out the void rifle and start firing up the cliff to get us some handholds and places to put pitons, that would probably be a good use of downtime.” She had made a few modifications before we’d left that ‘theoretically’ reduced the chance of malfunction.

I sat up from the ground where I had sprawled out and grabbed the rifle and began firing it fairly randomly in a line up the cliff. *Thunk, thunk, thunk.* I took sips of water in between, trying to pace myself on what remained of our supply. The rocks went a hundred feet up before they reached the bottom of Caer Laga’s wall, the equivalent of ten stories, and I wasn’t at all looking forward to the climb.

“He’s been carrying you across the desert for the better part of a day,” said Fenn. “We should rest here for the night and climb in the morning.”

“You’re not worried about the thaum-seekers?” asked Amaryllis.

“Of course I am,” said Fenn. “But I’m more worried about what’s going to happen if one of us falls to the desert floor after we’ve alerted them to our presence. I believe the human phrase is ‘certain death’, and we’re in a place where no one is going to collect and extinguish your soul. Petition to rest until first light, your highness.”

“Fine,” said Amaryllis, looking down at her ankle. “First light. I don’t think I’ll be sleeping much tonight, so I’ll take the first shift.”

I took that opportunity to lay back down in the sand and stuff my face full of pemmican, which was starting to grow on me. I fell asleep with my mouth full of protein and fats.

Somewhat predictably, I was woken up by yelling.
It wasn’t first light, but twilight had come over the Datura Desert, enough to banish the multi-colored stars from the sky. It wouldn’t be long before the sun (somehow) rose over the infinite plane of tessellating Aerbs (no seriously how) and splayed light on us once more.

I was a bit more concerned with the yelling, which was coming from Fenn, and once I saw it, the totality of my attention was turned toward the beast that was leaping over the dunes on a path straight toward us. One fun fact about the thaum-seekers that I don’t think I’ve shared yet is that they’re really, really fucking fast. They have crap acceleration, but given enough time to get moving, their powerful muscles allow them to chase down pretty much any form of transportation that’s not teleportation. This particular thaum-seeker had apparently seen us, and it was coming right for us.

I heard the thunk of the void rifle, and looked over at Amaryllis, who had positioned a pack behind her to give her something to lean against. She was peering down the barrel of her handmade weapon with a calm chill. Fenn was the one who had been yelling at me to wake up, and she was standing there with her bow drawn and arrow nocked. As I watched she loosed an arrow, which flew through the air and struck the thaum-seeker to no obvious effect.

I scrambled to my feet and picked my sword up off the ground. I was still waking up, but it still struck me that against a beast like a thaum-seeker, a sword was really not the weapon that I wanted to be using.

“No magic,” said Fenn as she drew and fired another arrow in the creature’s direction.

I had just enough time to remember a nighttime story that my father had read to me, which had always scared the crap out of me even though it was supposed to be cute fun. It has terrible tusks and terrible claws and terrible teeth in its terrible jaws.

And then it was on us, swiping wildly as it went over our heads and slammed into the cliff above us. I don’t know why I had expected it to turn on a dime when it took it so long to pick up speed, but I heard a crunch of bone as it hit the rock and it tumbled down to the ground where it sprang to its feet, swiping claws through the air. I raised my sword, which was knocked from my hand in a spray of blood which came mostly from its razor-sharp claws cutting off two of my fingers at the second knuckle. I screamed in pain.

Critical failure!

“Duck!” Fenn called from some distance away, and I flattened myself to the ground without needing another word from her. A second later, a now-familiar volley of arrows flew over my head and drove straight into the thaum-seeker, killing it instantly.

Thaum-seeker defeated!

“Okay, so I shot my wad a little bit there,” said Fenn. “But it looked like --”

“We need to move,” said Amaryllis. “Now, Joon, heal me?”

I went over to her, trying not to stare in shock at my missing fingers, and began picking up the bones beside her. I was bleeding, less badly than I would have thought, which was probably because the thaum-seeker hadn’t made that clean of a cut. I placed my bloody, disfigured hand on her ankle and used my other hand to touch the bones. I pulled as hard on the power in the bone as I could, targeting
the particular aspect of endurance I knew was inside it, then picked up another one and repeated the process when the first crumbled to ash.

Fenn had already started up the cliffside. There had been ample handholds before, and it hadn’t been a true vertical, but I must not have woken to the thunk of the void rifle, because there were clearly irregular holes drilled into the cliff at awkward intervals where no other grips were available, at least for the first fifty feet. Fenn was taking advantage of those and moving quickly, not stopping to steady herself or look very carefully at where she was going. For a moment I thought she was leaving us to our fates, but when she was thirty feet up she found a small ledge to stand on and drew her bow again.

“It’s a nice day for a climb,” Fenn called down to us. “When you’re ready, that is. Two shots left, by the by.” I burned through another of the bones and prodded Amaryllis’ leg; she winced and shook her head. “I’d say take your time,” Fenn continued. “But we have company approaching from all sides, six -- nope, seven -- in total. My guess is more to join the party shortly.”

It took another two thick bones of healing for Amaryllis to rise to her feet and begin the climb, her void rifle strapped to her back and everything else left on the ground below. I followed after, trying my best to climb with one good hand, worried that if I used both I would get the handholds all slippery. I was moving slowly, slower than Amaryllis, who climbed like vertical movement was as natural as walking, as though she’d never been hurt at all. Fenn was still on her ledge, now with an arrow nocked, and she kept glancing to the two of us and muttering under her breath. I’d left my sword behind, having lugged it across the desert and only used it long enough to have two of my fingers removed.

“Take the next shot you get,” I told Fenn.

At this point I was praying that the thaum-seekers would prove to be terrible climbers, but that was a flight of fancy. What I was hoping for was a level up. I considered myself overdue for one, seeing as the last one I’d gotten had been from Fenn killing Leonold, back in Silmar City, and I’d both finished a quest and killed two people since then, plus those that Fenn had taken down. I’d thought that the thaum-seeker would be it for certain, but nothing had happened, and I wasn’t entirely sure that a level up would regrow my lost fingers, but I was really hoping it would.

Fenn loosed another of her artillery shots, aiming far away from me. I heard the whistle of them moving through the air as they multiplied through their flight, then arrows driving into flesh and striking sand. I didn’t stop to look down and see the results, because I got a helpful message from the game.

**Thaum-seeker defeated!**

**Thaum-seeker defeated!**

And yet still no level up. Fenn only had a single artillery shot left and she needed to be a good distance away to actually use it, but I was focusing too hard on climbing to think about how fucked we were. Just after I blinked the messages away, I heard a number of dull thuds in a row as thaum-seekers slammed into the rocks. Alright, so they’re suicidally inclined toward killing us, good to know. And then I did take a moment to look down, and saw them climbing up after me, not terribly graceful, and not able to use the handholds as effectively as I was, but still moving faster than I was.

“Sorry Joon,” shouted Fenn as she threw her bow over her shoulder and began climbing again. That was fine, her normal arrows were plainly ineffective and her artillery shot wasn’t any good up close, so if she’d stayed on the ledge it would really be more about moral support than actually helping me.
I got a little more reckless with my climbing, grabbing onto handholds and moving forward without testing my weight or practicing the motion of switching from one handhold to another. To be honest, I probably would have dumped stat points into PHY as an emergency measure if I thought that I could have spared the time to do it.

I heard more thudding, crunching sounds from down below, and I felt each of them through the rock I was desperately gripping onto. Fenn had quoted seven, but they hadn’t stopped at seven, they seemed to just be pouring more and more on. I glanced up higher than the next handhold for the first time in a long time and saw Amaryllis looking out over the ledge right next to the tall walls of Caer Laga itself, with Fenn another twenty feet below her. She hadn’t said where exactly the wards were, but I was hoping it was there, because my pain in my hand was starting to overwhelm the adrenaline.

I was forty feet from the top when something hit my left foot hard enough that I was almost pulled from the rocks by the force. I screamed in pain when I realized that razor-sharp claws had cut through both my shoe and foot. I looked down and saw the thaum-seeker lifting itself up and drawing back for another strike. My foot was dripping blood down into his face. I moved just in time to avoid his swipe, but if we kept doing this I was going to be stopped in place, and there were others climbing up around him.

Alright, time to get stupid.

My heart was hammering away in my chest, fueled by its need to offset the blood I was losing and whatever mixture of neurotransmitters my brain had determined were acceptable to deploy when faced with near-certain death (i.e. all the good stuff). It didn’t take me long to find the movement of my pulse, and I braced myself against my foothold and handholds just in time to catch the beat of my heart. The power of blood magic launched me twenty feet into the air along the surface of the cliff.

I was mostly saved by the fact that the cliff wasn’t at a true vertical, but it was a close thing, because my injured hand slipped from a handhold and my injured foot spasmed again the rock, leaving me momentarily stopped from tumbling back down by only a single hand. It took me time to find my footing again and steady myself, time that the thaum-seekers spent clattering their way up the cliff. I could barely hear them over the sound of my ragged breaths. That left me another twenty feet from Fenn and Amaryllis, both standing beside Caer Laga, so I steadied myself and used the power of my blood to do another supernatural leap.

Fenn and Amaryllis were waiting for me, both laying down on the flat ground with their hands stretched out. Fenn grabbed my right hand and Amaryllis grabbed my left, but my right was covered in blood down to the elbow from where my missing fingers had been bleeding, and I quickly slipped from her grasp, off to the side, which started pulling Amaryllis. I landed one foot on an awkward piece of rock jutting from the cliff and managed to stop myself from falling. Amaryllis was halfway off the cliff, still holding onto me but not secure herself.

“Coming up,” I said, before pushing off from the foothold with another surge of blood magic and landing in a heap with both of them on the slender piece of flat ground. I scrambled to my feet and looked down at the approaching thaum-seekers. We had barely seen them on our way to Caer Laga, but at the first use of magic they must have come in from all over the desert. There were dozens, maybe hundreds, with more of them racing in. This high up we could see all the way to Barren Jewel, which was little more than a smudge on the flat desert.

I finally had a chance to check my vital stats and saw that I was at 15/27 health and 69K/75K blood, better than I thought I had a right to. Behind us was a wall too flat to climb, with windows too high to reach, and there was no path we could take. The thaum-seekers were closing in fast. “We have to get behind the wards!” I shouted.
“We are,” Amaryllis replied.

I watched as one of the great red beasts slipped a claw up above the ledge and my mouth opened in shock as that claw was vaporized. The thaum-seeker lunged up regardless, and I witnessed it being peeled back like someone was doing a destructive scan, revealing strange bits of bone and flesh that took away first its hands, then face, then head. The legs and lower half of the torso fell down, having not quite risen to our level.

*Thaum-seeker defeated!*

I let out a breath I didn’t know I’d been holding.

The rest of the thaum-seekers stopped where they were on the cliff face, and the ones on the desert a hundred feet below us came to a halt, save for those that were still barrelling across the sands to us, but even those slowed down, digging their claws into the sand to gain traction or tumbling across the dunes to kill their momentum. They didn’t retreat; they simply stared up at us.

“Well that’s frickin’ creepy,” said Fenn. “We’re confident in this ward business?”

“Yes,” said Amaryllis. “Mostly. Caer Laga has been standing abandoned for generations. The wards weren’t supposed to degrade with time.” It felt like there was more to that thought, but she didn’t say the rest of what she was thinking.

“Then let’s get our butts in gear,” said Fenn. She looked up at Caer Laga. “That is quite the wall to scale. And not much in the way of windows.” She pointed at the narrow windows. “I suppose it wasn’t enough that this place was built in the middle of an exclusion zone, a hundred feet up, but the windows had to be arrow slits too, just in case some silly fuck decided to … god, I don’t even know what your ancestors were thinking.”

“They’re not that narrow,” said Amaryllis. “I think we can slip through, if I can get up there.” She unslung her rifle and began firing at the wall, carefully making handholds. I wondered how confident she was in whatever changes she’d made to the void rifle. I wasn’t sure what catastrophic failure would look like, but wasn’t eager to find out.

“You okay Joon?” asked Fenn as we heard the thunk of the rifle, over and over. Her attention was directed down at the unmoving thaum-seekers that peppered the rocks. “You should really learn to climb better.”

“I should learn to use a sword better,” I replied. I looked down at my hand, which was still trickling blood. I was missing the pinky and ring finger of my right hand, which was shaking badly. It began to hurt more as I came down off the high of fearing for my life. “Fuck.”

“You’ll live,” said Fenn. “I thought you were supposed to do some magic healing thing soon.”

“Yeah,” I said. “I’m … not entirely sure what happened.” I sat down with my back against the warm wall of Caer Laga. Blood loss was going to become a problem again, I could tell that, and if I was going to get dizzy I wanted it to be as far from the cliff as possible. “I’m hoping that it wasn’t just because it’s been you doing most of the work.”

“Well, if the game is going to punish you for being smart about things, then it sounds like a shit game to me,” said Fenn.

“Sure,” I said. “But if you were making a game where people can get more powerful by killing goblins, then –”
“Don’t speak of goblins like that,” said Amaryllis.

“Oh,” I said. *Note: ask about goblins later. Were they the bookish variants? Or was this just some fantasy political correctness thing?* “Well, imagine that you made a game where someone was supposed to kill the undead, but instead of using a rifle and sneaking around, they built a giant trap and lured all the undead into it. You’d want to say ‘nu-uh, that doesn’t count’.”

“Why?” asked Fenn. “Is this a human thing? You set up an objective, but you need to have that objective accomplished in some circuitous way, and then you slap people on the wrist when they figure out a clever trick?”

“Unspoken rules,” said Amaryllis. *Thunk.* “We had to remove a general for violating them during war games.” *Thunk.*

“Anyway,” I said. “If it were me, I’d put an xp penalty on things that you killed with the power of that bow. That hasn’t been a bad heuristic so far, so … I’m not asking you to stop, but if that’s how we resolve encounters, I’m not sure that I’ll get that much out of them.”

“Feh,” said Fenn. “Well, the ugly beasties are still staring at us. I was hoping they’d give up.”

“Holds are done,” said Amaryllis. “They’re awkwardly angled. I’ll go up first, alone for now.”

“We’ll be safe here?” asked Fenn. “That ward won’t activate on us if you’re too far away?”

Amaryllis hesitated for a brief moment. “You should be fine. Besides, there are several wards here, I can feel their bindings when I pass through them. That one, the one that the thaum-seekers were hitting, I think it was only for them, projected away from the physical structure for added protection. There are different ones for people, which shouldn’t start until we’re past the walls. My will should allow you past those. Like I said, you’ll be fine.”

Fenn sighed and sat down next to me. “Let us know when we should follow.” She rested her head and closed her eyes.

I watched Amaryllis climb. I had known that she was well-muscled (a flash of her at the bathhouse went through my mind, that one specific image trapped like amber of her putting her hair up and looking back at me), but watching her climb was awe-inspiring. She used not just the dime-sized holes she’d drilled into the wall, but small imperfections in the stone exterior, sometimes seeming to stand on a perfectly flat surface. At other times she pulled herself up with her upper body alone, all of her weight put onto a few fingers. Through all this, she was still carrying the void rifle across her back. Climbing was apparently just one of the things that she was really, ridiculously good at.

She came to the lowest of the windows and with a careful series of motions, took the void rifle from her back using a single hand, placed the muzzle against a specific portion of the window, then using the same hand got her fingers in position to squeeze the trigger handle. *Thunk.* If I had been asked to do that at ground level after having ten minutes to practice, I was fairly sure that I would have failed nine times out of ten. *Both my companions are higher level than me.*

After Amaryllis slipped inside, Fenn spoke up.

“So,” she said. “What are the odds that she abandons us?”

“One percent,” I said.

“Alright,” Fenn replied. “I will take those odds.”
“I don’t have any money,” I replied. “I actually don’t have anything but the clothes on my back, and
I’m down half a shoe.” I looked at my foot, where the heel was bleeding. “So I’m not sure what
we’re betting.”

“An unspecified favor,” said Fenn. “If she doesn’t come back, you owe me a hundred favors. If she
does come back, I owe you a favor. You said hundred to one, right?”

“Seems like you’re just giving me a favor,” I replied. “If she was only pretending her tattoo had
failed, and really intends for us to die here, there’s no way for you to collect, is there?”

“Who knows,” said Fenn. “We might end up in the same hell. There’s no death clause on this bet,
Joon. If we starve to death out here, or if the ludicrous wards up and kill us, then I’m a-coming for
you to make you pay up.”

After twenty minutes had passed, I was getting a little bit nervous, not just that Amaryllis might have
left us, but that something might have happened to her inside. It was dead quiet. The thaum-seekers
were still below us, arranged in exactly the same positions, waiting on us to come to them, or
whatever their thought process was (if they had thoughts). Fenn was silent, and I was too injured to
want to make conversation.

Amaryllis finally climbed back out the window when a half hour had passed, much to my relief. I
nudged Fenn, who had fallen asleep (or pretended to). “One favor,” I whispered.

“T ook your time,” said Fenn.

“Got the glove,” said Amaryllis, pulling a single black glove from her pocket. She had shed her
robes, her rifle, and her shoes, leaving her in a t-shirt and pants. The glove was the single blackest
thing I had ever seen, so black that I would momentarily lose my idea of the shape of it when its
individual parts overlapped each other.

“I thought it was supposed to be two gloves?” asked Fenn.

“I guess not,” said Amaryllis. She slipped the black glove on. “All I had on this one was the word
‘extradimensional’, but so far it seems to suck in whatever the glove touches and then spit it back out
on command. It should be the solution to getting the two of you inside. There’s no way Joon is going
to make that climb in his condition.”

Fenn frowned. “You want to stick us into a glove,” she said.

“Just for a moment,” said Amaryllis. “I can make the climb before you run out of air, if there’s air to
run out of inside the glove.”

“How safe do you think it is,” I asked. “If you had to put a number on it?” A 1 on a 1d20? A 1 on a
1d100? I probably would have taken a 1% chance of death at this point, if there weren’t better
options.

“I tested it inside,” said Amaryllis. “It can fit at least two covered armchairs, both of which I returned
to existence without any damage to them. Usually heirlooms don’t fail catastrophically if you exceed
their bounds. I can make the climb faster with bare feet, you shouldn’t have any problems with any
time limit.”

“I’d be more comfortable with rope,” I replied. Amaryllis’ face fell. “Not that I don’t trust you, but
we have some time.”

“I found the jar too,” said Amaryllis. “It was sealed. There was a warning on it. All our food is at the
bottom of a cliff that’s still covered in magical beasts who would like nothing better than to kill us. They seem to be content to wait. If I’d found any rope, I’d be throwing that down to you now. The faster we can get inside, the sooner we can split up and search for something that will let us extend the time it takes for us to starve.”

“You had me at starve,” I replied. That was an old D&D joke, one that we’d collectively run into the ground. Amaryllis didn’t laugh, and neither did Fenn. Neither gave the traditional continuation, which was ‘but starve was the last thing I said’.

“Fine,” said Fenn. “Juniper, if I die, avenge me.”

Amaryllis rolled her eyes. “Hold your breath as long as possible, and don’t try to leave until you have to, I don’t want you falling out of the glove while I’m climbing, because that could kill us all. It takes ten seconds to charge up, so try to time your breathing to that.”

Fenn went first, sucking in a huge amount of air while Amaryllis gripped her forearm with a gloved hand. After ten seconds had passed, Fenn disappeared entirely and without any obvious effect. Amaryllis quickly moved to me, and I began taking in deep breaths, trying to find one to hold. At nine seconds I started holding my breath, and at ten seconds the world went black.

I found the way out right away, almost instinctively. It was like I was in a space no more tangible than a soap bubble, and all I needed to do was to direct a thought at it to pop myself out. If not for that, I might have panicked, but I could feel at the back of my mind the possibility of escape if I really needed it. I wasn’t particularly claustrophobic, but it was completely dark, I was holding my breath, and I was weightless, with my clothes drifting away from my skin until they were tugged back.

I started counting, for lack of anything better to do, and tried to figure out where Amaryllis would be on the wall, based on how fast she’d climbed it before. She’d be moving faster now, both because she had a route and because she was carrying cargo with a time limit on it. How long could a person hold their breath? In D&D you could hold your breath for double your CON score, so about twenty six-second rounds, or two minutes, if you were an average human. I didn’t know what the game used for that, though I suspected it would be END. Obviously there was no math that I could see or rulebook I could consult, but I was hoping that I could at least last a minute, maybe two.

My counting was getting faster the longer I was in there, and I tried to consciously slow it down to compensate, but either way I was starting to get that panicking feeling of needing to take a deep breath of air by the time my count reached the triple digits.

I came back into the world disoriented and gasping for air, with a sudden jolt of pain as my wounds were exposed to fresh air. Then all that pain went away in a glow of light.

Quest Complete: Mothballs - You have arrived at Caer Laga and laid claim to the heirlooms within. You may return to Caer Laga at any time with your teleportation key.

Level up!

It had been too long since I’d felt that light touch me, the fingers of it gently gracing the pleasure centers of my brain. I felt somewhat hollow as it receded from me, a feeling that hadn’t come with it before, and it was with regret that I returned to the real world.

We were in a stone hallway, more spartan than I might have expected with nothing adorning the walls. But then, this place had been constructed in a hurry as the land was turning to desert around it, hadn’t it? There’d have been no reason for them to make it luxurious.
“Better?” asked Amaryllis. I nodded and flexed my hand, where my fingers had returned, whole. I wondered whether we would find duplicate fingers if we went back down to the desert floor.

Fenn was standing next to Amaryllis with her hands on her knees, breathing heavily. “Ya know,” said Fenn. “Elves can hold their breath for an hour. Guess I didn’t get my dad’s lungs. Also, let’s never travel by glove again.”

“Come on,” said Amaryllis. “Let me show you to the fruits of our labors.”
Rolling Need

She led us down several hallways as we slowly regained our breath, moving with purpose. I caught glimpses of other rooms, mostly bare but some with covered furniture in them. These were ideal conditions for keeping things in stasis, since there was rarely weather in the Datura and it was almost constantly warm and dry. A part of me wondered whether this was going to be our base of operations, which any good videogame needed to have. I could see that as a quest, to get this place up and running again, to have people and things shipped in at great expense … even though it would be pretty damned impractical, which was the whole reason that this place had been mothballed in the first place.

We eventually came down to an opened metal vault, lined with pedestals, hooks, and shelves, most of which were empty. Three mannequins sat at the back, only one of them with armor on it, a suit of elegant full plate with a heavily stylized anvil on the front. There were two swords. One had a thin basket of metal around the handle, and I would have called it a rapier if its edge didn’t look too sharp for it to be primarily a thrusting weapon. The other was a very plain blade with a somewhat dull reflection; it was a sword so generic that it somehow seemed like it was hiding something.

There were other things as well, an amulet with a blue gem sitting on a pedestal, a small wooden box inlaid with ivory, and a ceramic jar depicting fairies playing, its lid closed tight with red tape. With the glove, that made seven items in total.

I recognized three of them from the games I’d run.

“We probably shouldn’t open that jar until we’re ready,” I said.

“You have some hint?” asked Amaryllis.

“I don’t know what its proper name would be,” I replied. “I, um, never gave it one. But if it’s what I think it is, it’s full of fairies made of marzipan. When we open it, they’ll attack.”

“What is the godsdamned point of that?” asked Fenn.

“I think they’ll only attack the first time,” I said. “At least, that’s how it was when I made it.”

“In this long dream you once had,” said Fenn with pursed lips.

“He’s been right before,” said Amaryllis.

“Marzipan fairies,” said Fenn, with a raised eyebrow. “And they … heal you?”

“If you eat them, yeah,” I replied. “The jar keeps generating them over time, but after the first batch I think the rest should be docile.” I had given the party the item as a way to partially make up for the fact that no one had wanted to play healer; fairy murder became a recurring joke. You had to snap their necks so they didn’t wriggle on the way down.

“Okay,” said Amaryllis. “We can prepare for that. These fairies will be our food source then. Hopefully it’s enough to stave off starvation for a while.”

“I think that armor is immobility plate,” I said, pointing at the suit. “It’s basically an immovable rod in armor form. It stops you from moving.” I pointed at the box. “And that’s probably the clonal kit, which can make a copy of any of the standard adventuring kits, though I’m not sure how that would translate here.” Amaryllis and Fenn were both staring at me.
“Well, damn,” said Fenn. “I guess we get to see whether you’re nuts or not.”

“This is the first time you’ve made specific, testable predictions,” said Amaryllis, which sounded enough like agreement that I was slightly hurt.

“That’s not true,” I said. “I’ve had all sorts of insights into things that I shouldn’t have, given that I’m dream-skewered.”

“Yes,” said Amaryllis. “But most of those were pieces of knowledge available to the general public, or provided to you by the words written across your eyes, which I would consider separate. If I’m hearing you correctly, this is the first time that your actual memories of creating this game will be tested. Everything else could have been formed post hoc by an irregular skewer. You remembered about Barren Jewel, but it didn’t fit in with the dream of Earth, so the skewer warped your mind by inventing this game you played and placed Barren Jewel within that fiction. If you’re correct about these items, that rules out the backformation hypothesis.”

I looked between the two of them. “Have you been talking to each other?”

“Of course,” said Fenn. “We’re a team, that’s what we do. Did you think that we’d have a self-confessed mentally diseased team member and not talk about it with each other? I’m not that irresponsible.”

“We didn’t mean anything by it,” said Amaryllis. “Nothing was said that we wouldn’t have said in front of you. There were just … decisions that we needed to be prepared for.”

Loyalty Increased: Amaryllis lvl 6!

“You do?” she asked.

“Yeah,” I replied. “The story as you’ve heard it is basically, ‘I created most of the elements in this world with my friends as part of a game and now I’m trapped here’. I would probably think that was absolutely crazy if someone said it to me, even with the demonstrable abilities I’ve displayed. Caution was, or is warranted. It’d be pretty dumb of me to chastise either of you for doing what I would have done.”

“That … is remarkably mature,” said Amaryllis.

“I’ve been through some things, in the last few months,” I replied with a shrug, but I was blushing, because Amaryllis was impressed with me.

“Hoomans, I admire this display, but I was promised a glove, and you know the saying,” said Fenn.

“No glove, no love?” I asked. I smiled and then laughed at my own joke, which neither of them had any reason to find remotely funny. That made it even funnier to me.

Amaryllis handed over the glove and went to the swords (and for having a fancy name like “investiture”, apparently all it meant was handing the magic item over to someone else). Amaryllis touched first one sword, then the other, and handed me the suspiciously boring one. It immediately sprang to life in my hands, changing and warping into different forms, becoming thicker, then thinner, sharp, then dull, long, then short, never staying as one particular sword for very long. Despite that, it was perfectly balanced in my hand the entire time, forming counterweights in the grip to ensure that the shifts it underwent weren’t too jarring.
“Oh, neat,” I said. “It’s the Anyblade.” I directed a thought at it and transformed it from a sword to an axe wrapped in decorative gold hair, then to a small dagger with a skull on the hilt, then to a bronze khopesh. When I turned it back into a plain, generic sword it had settled down considerably, shifting only gradually between different forms. I stilled it with a thought.

Amaryllis was staring at me again. Her own sword had done nothing much of note while I’d played with the Anyblade.

“How many magic items did you think up?” asked Fenn. She was looking at my Anyblade with envy in her eyes.

“First off, you can’t have it,” I told Fenn. “Second … I think the answer is probably hundreds, if we’re just talking about the ones that I made, not the ones that were appropriated from a sourcebook or intentionally adapted from some other canon. If you included all the really derivative stuff, I’d say maybe a thousand.” I tried to quickly check my math. Four players, times eight years playing, times two sessions a week, times fifty-two weeks a year, at one magic item per session per player, was a sloppy-rounding upper bound of three thousand two hundred. With weeks off, being low on players, not always being DM, or handing out duplicates it had to be a lot less. “I don’t know for sure. Why?” (Truth be told, I was quite enjoying myself. I had acquired loot, and I was on pretty solid footing, especially relative to Fenn and Amaryllis. The feeling of knowing something that they didn’t, and having it actually be useful instead of just being some bit of ‘Airthian' pop culture, was a pleasant one.)

“Mary, how many magic items are there in the world?” asked Fenn. She pointed straight at Amaryllis while keeping her eyes on me.

“I find it annoying that you would expect me to know that,” said Amaryllis with a frown. “Also, we’re talking about entads and heirloom entads, magic item can refer to a larger class of …” Fenn was moving her hand to mimic a flapping mouth. “A billion would be a close approximation, that’s one for every five people, but Pareto’s Principle applies, and twenty percent of the population has eighty percent of the entads.”

“Pareto was from Earth,” I said quickly. “He was an Earth mathematician.”

“No, she was a well-respected computer,” said Amaryllis.

“Irregardless,” said Fenn. “There are a billion magic items in the world, and Juniper claims to have thought up hundreds or maybe thousands of them. If he’s right about what the items do, and I think he probably will be, then … someone else could apply math, but that seems like a pretty astounding coincidence to me.”

Amaryllis tucked her hair back behind her ear and frowned for a moment. It took me watching the marginal movement of her lips to realize that she actually was doing the math. I wasn’t even sure where you’d start for that.

“It’s a pretty astounding coincidence, yes,” Amaryllis finally said. “One in one quintillion, or thereabouts. That would require a bending of probability beyond even the powers of the oldest elves.” A silence fell on us after that.

“Welp, add that to the ol’ mystery pile then,” Fenn smiled, “I helped!”

“We should fight the fairies soon,” I said. “If I’m remembering right they spawn in slowly, and if we’re going to be here for a while, we’ll want to get as much out of them as possible.”
“Armor first,” said Amaryllis, stripping off her shirt as she walked toward the mannequin. I averted my eyes after a moment of shock. We’d all shared a room together for a week, and I had seen Fenn naked more times than I could count, since she took some delight in seeing me react. Amaryllis wasn’t exactly shy, but it seemed to me like she’d taken some steps to be more modest, for my sake if not her own. She was beautiful, and though I tried, I couldn’t quite constrain myself to believing that I was simply her traveling companion when I saw her unclothed.

I turned my back and kept my attention on the Anyblade, testing the limits of its abilities. It could only do blades, but it was pretty permissive when it came to what a blade was, and I could work whatever I wanted into the ornamental features of the sword, axe, or other bladed weapon I formed it into. Changes didn’t quite happen at the speed of thought, but it was fairly close, enough that I thought that I could probably use a change in shape to my advantage during combat. The Anyblade had belonged to a rogue of Reimer’s, and Reimer had a tendency toward munchkinry which I liked to indulge him in, within reason. I tried to think of the things he’d tried, and which I had allowed. With a thought, I protruded a key from the base of the hilt. I smiled at that, and had the sad thought that Reimer would probably have loved to be here.

I turned around when I was nudged in the back, and saw Amaryllis in her full armor.

You know that scene in stereotypical teen movies where the artsy girl with no fashion sense or the tomboy who wears baggy clothing or whatever -- the hot actress that everyone pretends isn’t hot, because she needs to be hot to sell the movie but needs to be unattractive for the story to work -- anyway, she has prom, or a big date, or something like that, and so she gets her hair styled, puts on a dress, takes off her glasses, and applies some makeup. Then there’s this big reveal, where - ta-da! - it turns out that she’s actually really pretty.

Amaryllis was not more pretty wearing magical armor. It was pretty armor, and she was definitely pretty, but the armor was proper full plate, which meant that it didn’t display any curves or expose any skin. No, instead of becoming pretty, Amaryllis became deadly. I mean, she was already deadly, muscular and precise, my introduction to her had been her calmly pointing a gun in my face, I’d seen her kill a lot of people, and yet … somehow I hadn’t fully understood it until I saw her dressed in full plate, holding a magical sword, her hair tied back in a neat bun, and with a blue amulet glowing around her neck. Amaryllis wasn’t someone to fuck with. She would scythe her way through an army and stand on a mountain of corpses if she thought that was necessary. She would kill without mercy or warning. She would display as much compassion and regret as a claymore mine.

(And I hope you can see where I’d draw the comparison to a teen movie, because we’d already had our equivalent of that scene where the female lead drops her glasses and the male lead reaches over to tuck a strand of hair behind her ear and say something like, “you know, you’re kind of cute without your glasses”, but for us, it had been the moment she’d killed Poul in cold blood because her motorcycle wouldn’t comfortably fit three people, and I’d thought, “you know, you’re a little bit of a cold-blooded killer”.)

The first proper thought to run through my head was, “Holy shit am I glad she’s on my side,” which did soften the jolt of fear and unease I’d experienced. My second thought was the less reassuring, “Wait, how sure am I that she’s on my side?” The answer to that was, of course, 6. I was 6 sure that she was on my side, 6 out of maybe 10, maybe 100, maybe even more. My only consolation was that both Amaryllis and Fenn were at about the same loyalty, which wasn’t actually much of a consolation at all, especially not if they were talking about me behind my back.

“You look nice,” I said.

“It’s not about looks,” said Amaryllis. She spun her sword around, then held it in front of her. The
blade disappeared, leaving her holding only a hilt, then reappeared in place. She frowned at it briefly. “The sword’s benefit is fairly minor, but might be useful in a pinch.”

“Um,” I said, no longer sure that it was wholly wise to offer her good advice. “Is it actually gone, when it disappears? What happens when it comes back in and there’s something in the way?”

Amaryllis made the blade disappear again and pointed the hilt toward the nearest mannequin. The blade reappeared, stuck halfway through its chest. Amaryllis pulled the blade out, inspected it, then slashed at the mannequin with frightening speed, flickering her blade on and off, which left a series of deep, penetrating cuts.

“Thanks,” she said, giving me a small smile.

“That leaves only the amulet unaccounted for,” said Fenn. “I don’t suppose it has the power to get people out of a desert? Because even if we can survive off fairies made of almond, then we’re still stuck here.”

“The amulet is passive, and no real help here. We’ll unseal the fairies first,” said Amaryllis. “Then we’ll try to figure out what our endgame is. Joon, we might need you to put everything you can into tattoo magic. You should have four points to spend now?”

“Yes,” I replied. Her continued possessiveness over my power still rankled. “I’ll hold them in reserve. Obviously I don’t want to go down that path as yet.”

“Sure,” said Amaryllis. She slipped on the helmet that came with the suit of armor, which locked in place all on its own with a hiss. “Let’s go.”

We did actually end up doing a little bit of monkeying with the clonal kit before opening the jar. One pleasant surprise was that we could all use it, which brought the item count to one for me, one for Fenn, two shared, and three for Amaryllis. The unpleasant part of the kit was that it was fairly particular and somewhat finicky. What you had to do was hold the box (roughly the size of a backpack, but boxy) in both hands, think about some sufficiently generic profession, and the box would give you a collection of items related to that profession, which you could direct to some degree by concentrating correctly.

We tried some stuff that might have worked and gotten us out of the jam we were in, like trying to make the clonal kit produce a box of teleportation keys by thinking specifically about a guy who had that as his profession, but that didn’t work at all. The clonal kit could make food if we thought about chefs or waiters, but here we ran into one of the limitations I’d worried we might; anything you made with the clonal kit needed to be repaid.

“So, the problem was that telescopes are like, really, ridiculously expensive in D&D,” I said. “And I made the mistake of saying that yes, it could make telescopes, which were worth … um, the equivalent of what someone working minimum wage would make in ten years or something dumb like that, I don’t know, the games had kind of dumb economics unless you did a lot of work, anyway,” I took a breath, “To curb that, when the players decided that they were going to just make a bunch of telescopes and sell them, I said that you had to pay the box back. In other words, you have to put things back in the box for it to work again, or you have to give it something of equal value.”

“And the box was worth more as a magical box than just, I don’t know, making a box full of precious gems?” asked Fenn.
‘What profession do you think just lugs around a bunch of gems?’ I asked with a laugh.

“Gem mage, o weak-brained human,” replied Fenn. “They’re the ones with the gems?”

“Er,” I said. “Right, but that wasn’t a thing in our games, probably because no one ever thought it was a good idea to tie a class power to material wealth.” Beyond what was already in the game, anyway.

“Even without the fairies, the clonal kit will allow us to stave off starvation for quite some time,” said Amaryllis. “Depending on what the kit thinks things are worth, we can likely cannibalize much of what was left behind in Caer Laga, or use the kit to arbitrarily turn items into higher value, lower weight items for transport. For now, we need a net.”

What followed was a few different attempts at making nets as we tried to get one that was tight enough to potentially capture a marzipan fairy. Eventually Fenn came up with a profession that captured butterflies, which were apparently a delicacy in some far off land, and while that had the ring of pure bullshit to me, the clonal kit produced a fine mesh net for us.

We draped the net over the jar, popped off the lid, and that was about when all hell broke loose, because either I had forgotten just how tough I’d made the fairy fight, or I had thought that goddamned fairies made of literally nothing but honey and almond meal wouldn’t actually be a threat to us. Maybe I just hadn’t been properly paranoid, since I wasn’t considering that the fairies would coordinate.

The first twenty or thirty out of the jar (it’s really hard to count fast-moving creatures the size of a thumb) lifted off the net, putting their full weight behind it and moving to the side so it would slip off. We hadn’t weighted down the net, because we were idiots who had underprepared. Once the net was clear, the rest of the fairies flew out of the jar in a torrent, spreading gossamer thin wings and darting around the room for just a moment before they went on the attack.

Amaryllis’ sword flickered through the air, strobing in and out of existence as she cut through the mass of fairies, and a fair number of them split in half and tumbled to the ground. A few of them plinked against her armor for a moment, then they split away from her and went towards Fenn and I. I swung my sword through the air, but the individual fairies were small and agile, and swords really weren’t meant for that kind of work. I tried to give the Anyblade a different shape, but nothing came to mind, partly because I quickly had fairies all over me.

They tugged at my skin and bit at me, going for my eyes, mouth, nose, and ears, grabbing my fingers and slipping in under my clothes. I dropped my sword and swatted at my face, scraping several fairies off and injuring myself in the process, because they had grabbed onto my eyelids and nostrils. My hands slapped against the places I felt pain, squishing fairies flat, until a quintet of fairies made a play for my mouth, opening my lips before I realized what was happening, then slipping past my teeth and using their tiny legs and hands to force themselves down my throat. That was about when I started worrying less about the fairies that were biting me and trying to rip through my skin, and started worrying more about whether I was going to choke to death. I chomped down to kill the fairies that had ahold of my teeth and then stuck my fingers in my mouth to try to grab the ones that were already activating my gag reflex. One I caught by the leg with my thumb and forefinger, enough that I could pull her back and bite her through the midsection, but the other one was too far down, kicking my uvula and making me short on breath.

Then Amaryllis was on me, slapping away at the fairies on me, but I was still choking on the one in my throat, which was doing its level best to squirm its way down. I was already panicking and trying to take deep breaths that would let me get air around it, but when she grabbed hold of some internal piece of my throat, that flap that lets you not get food in your lungs, I began a choking scream.
Amaryllis, in full plate, pushed me to the ground and placed a knee firmly on my chest. She held the sword hilt high above me, pointed straight down, and my eyes went wide with fear and understanding right as the blade materialized, the point of it suddenly going right through my throat and impaling the fairy inside.

I choked and turned over, spitting a slimy marzipan fairy onto the floor and then scrambling to my feet, looking for more of them and trying to take in deep breaths while at the same time using my shaky hands to protect my mouth. I was bleeding all over, spotting my clothes with blood from a hundred bites, and especially on my face it felt like my skin had been ripped and torn at the membranes.

The room was silent. A half-dead fairy wriggled on the ground and Amaryllis stomped on it with an armored boot. The floor was littered with fairy corpses and splattered with blood.

“F**k me,” said Fenn. “Fuuuck me.” She was laying face up on the ground, staring at the ceiling, looking like she’d been smacked in the face with a rake a few times. She was bleeding all over her face, with small chunks taken out of it and a small bit of her ear missing. “Joon, if you did actually invent that thing through some stupid metaphysical loophole, I’m going to cut off your limbs and consume your flesh.”

“We should eat them,” I tried to say, but there was a hole in my windpipe, so it came out as, “Wegh a ggeh,” and then a bunch of coughing that ended up with a lot of blood on the floor. I stuffed a fairy into my mouth, chewed it as viciously as possible, then gulped it down, trying to ignore the burning pain of marzipan mush sliding past the hole in my throat. Almost immediately I began to feel better though, and I saw my health go up two ticks. I grabbed another bloody fairy corpse from off the ground (my blood, not the fairy’s) and shove it in my mouth. It took some time, and another eight fairies, but my wounds closed up and I was feeling much better.

Fenn had taken the hint and done the same, taking a bit less time than me, probably because she hadn’t been subjected to an emergency tracheotomy.

“Well,” I said. “That’s the jar o’ fairies.”

“Why would you make a thing like that?” asked Fenn. “How is that fun for anyone?”

“It’s complicated,” I replied, but it wasn’t really that complicated, we were just teenagers in Kansas during a time of peace and prosperity, and the jar of killer fairies had been part of a pretend world with only fictional consequences.

“Well,” said Amaryllis, taking off her helmet again. She peered into the jar. “It appears that this has been claimed, and if Juniper is right then we should have a much more convenient source of healing than a bone or blood mage, as well as food to ensure that we don’t starve. The only cost was pain.”

“Very easy to say when you weren’t hurt,” replied Fenn.

“Yes, it is,” said Amaryllis with a conciliatory nod. “There are other suits of armor that belong to my family line, a few of them I could grant to you through investiture. Once we get out of here, we might want to look into getting more for the two of you.”

“So it’s bribery, eh?” asked Fenn. She looked down at her black glove. “You certainly know the way to a half-elf’s heart, I’ll give you that. I’m less confident that there is a way out of here. Stripping down to expose the tattoo again might not be a bad idea, and I have always said that your upper arm was your most fetching feature.”
Amaryllis sighed and began to undo her armor, which was apparently quite the process.

“Wait,” said Fenn, suddenly tense. Her long ears twitched. “You wouldn’t have happened to have set up a rescue for us before we left, would you?”

Amaryllis shook her head and I could see her straining to listen, just like I was. I heard the distant sound a little bit later, a rhythmic one coming from outside and getting louder, but though it was very familiar I couldn’t quite place it until Amaryllis spoke up.

“Is that a helicopter?” she asked.

“Yeah,” I replied. “And if you didn't arrange for it, then ... you said that going to Sorian’s Castle wasn’t wise, because there might be wards set up to catch us? Is there a chance --”

“Yes,” said Amaryllis.

“Elf sense is screaming at me,” said Fenn. “Usually I listen, but it’s a bit incoherent right now, which is never a good sign.”

“Human sense is screaming too,” I replied. I picked the Anyblade up off the floor. “Exactly how safe are we here? How much will these wards protect us?”

Amaryllis put on her helmet. “We’re going to have to hope that our enemies have once again made the mistake of underestimating us.”
Siege

Warding magic was, apparently, a really complex thing, at least to hear Amaryllis tell it. I didn’t care so much about the low level aspects of warding, like how shapes were defined, just the high level stuff, like (hypothetically) how a fortress would be warded against intrusion and how intruders would get around those protections. Amaryllis had complained that I was asking her to describe centuries of cat and mouse games between warders, then mostly not indulged my need to know on the theory that I probably wasn’t going to think up anything clever in the next ten to fifteen minutes.

I found that really frustrating, so I’ll lay some knowledge on you so that you’re not as annoyed as I was.

Wards provided generalized, rules-based, countermagic. This was really, really powerful in Aerb, where “magic” included abstract categories and concepts, like ‘blood’ or ‘bones’ or ‘water’ or even ‘velocity’, especially since wards could act on so-called latent magic. Trying to explain all the rules behind warding would take too long and be too boring, even if I just stuck to Goettl’s Laws, but I can boil it down to some practicalities:

1. Buildings older than two hundred years tended to have permanent wards, while newer buildings tended to have periodically refreshed ones. (The clickbait explanation would probably have a title like, “How Bessemer Killed The Permanent Ward”.)
2. Most high-value buildings were warded against teleportation, except for the occasional room meant to handle teleported goods (or more rarely, people).
3. Most high-value buildings were warded against sufficiently high velocities, making them resistant if not impervious to ballistics and explosives.
4. Wards generally acted as either barriers or nullification zones, usually with some holes poked in them by whoever made them in order to alter their functionality. A consequence of this was that as soon as you were within the wards, you were as affected as you ever would be (unless the ward alerted the warder, in which case you might have company).
5. Wards could be broken by a skilled warder, but that took a lot of time and money, plus direct access to the ward itself, which could often be a problem.
6. Wards could be bent fairly easily by a warder, but would resume their shape after the fact (wards were generally unmoving). This was a far more common method of ward circumvention.
7. While most wards were used as barriers, some sufficiently powerful ones annihilated the magic in question instead. A powerful ward against blood would annihilate blood that got inside it (this kills the human).
8. Warders were athenaeum-trained and used a tool intrinsically tied to them that they spent something like six months building. It called to mind a Jedi having to build his own lightsaber, and was the primary reason that I hadn't unlocked Ward Magic, or whatever the skill would be called.

Speaking non-generally, Caer Laga had a ward that blood couldn’t pass, which would have prevented anyone from entering if not for the fact that a clever warder had poked a hole in it shaped specifically for a hereditary bloodline and anyone marked-through-thought as friend. This was our primary defense against intruders. It wouldn’t do anything to the intruders, it would just hold them back … unless they could bend or break the ward and then just walk right in.

“Could be worse,” said Fenn as we moved quickly down the stairs to the vault. “They came in a helicopter instead of teleporting in. We know they’re there.”
“And they can’t hover forever,” I said. “Unless this place has a helipad or they’re willing to risk an uneven landing on a sloped roof, we only need to hold out a few hours before they have to fly back.” My dad flew helicopters for a living and I was happy to have picked up a few things from him.

“Souls,” said Amaryllis, her voice muffled by the concealing helmet. Oh. Right. Helicopters here wouldn’t use petroleum products, they would use human souls. We’d driven for two days on a tenth-full tank of seven souls and not used up one of them. Odds were, they’d be able to hover nearly indefinitely.

“So the plan isn’t to lock ourselves into this vault, is it?” asked Fenn, as we reached the place we’d picked the magic items up from. We’d avoided windows, for obvious reasons.

“I don’t know,” said Amaryllis. “It’s heavily warded, more than the rest of Caer Laga. If they’re breaking the wards, it’s a decent place to take a stand against most of the opponents we might face. If they’re only bending the wards, then I don’t think they’d be able to get down here, the distortions would be too extreme for that. They have radio though, and they’ve almost assuredly called in their arrival, which means that we’re more trapped here than we were before.”

“Less trapped,” I said. “We can steal the helicopter.”

“None of us knows how to fly one,” Amaryllis began.

“My dad flew them, back on Earth,” I said. “I know, they’d be different here, and even on Earth I wouldn’t have been able to manage take-off or landing, but I think I can fly well enough for us to get back to Barren Jewel and have a survivable crash landing, especially with you in the immobility plate. We’re closer to getting out alive than we were five minutes ago.”

I hated the helmet Amaryllis wore. It was finely detailed and solidly built, but I could only see her eyes through a slit and though I hadn’t been good at reading her before, now it was basically impossible.

“Ohay,” she finally said. “We figure out exactly who we’re dealing with, then we kill everyone on the helicopter and somehow figure out a way to do that so that it doesn’t crash in the process. And we’d still have to worry about the thaum-seekers, because they’ve been known to launch themselves high into the air in pursuit of winged craft.”

Well, fuck. I had ‘flown’ helicopters before in the sense that I was allowed to take control of the flight stick under my dad’s direct supervision in calm, clear weather, because what’s a little gross violation of FAA regulations between father and son? I was fully aware that A) flying an Aerbian helicopter would not be the same B) I was completely unprepared to take evasive maneuvers if a thaum-seeker launched itself into the sky at me and C) if this game even had a skill like Helicopters or Piloting, I hadn’t unlocked it, let alone trained in it.

And the thing was, I still wasn’t sure that “hijack a helicopter” wasn’t the best plan we had available.

“So I guess we need a scout,” said Fenn, “And I would guess that it’s not going to be the one of us in full plate, and probably not the one who has almost zero experience being a sneak-thief, which leaves yours truly.”

“You have the glove,” said Amaryllis. We’d taken twenty seconds to put both the jar of fairies and the clonal kit into it. “Be careful. If you can, spin some kind of story, but we don’t know who they are or what they know.”

“Huh,” said Fenn. “You surprise me sometimes. I thought you would --”
“Go,” said Amaryllis. “Time is short.”

“And there she is,” smiled Fenn. “Joon, you’re still on avenging-me duty.”

“I’d rather kill them before they kill you,” I replied. “You owe me a favor.”

“Go,” said Amaryllis. Fenn smiled and slipped out the door.

As before, I lit the place with a hand of fire. It had been a while since it was just Amaryllis and I, and even longer since we’d been together with just the light of my blood. I felt awkward around her. Maybe it was the armor, or maybe it was what felt like sure knowledge that she would kill me if I threw too much of a wrench in her plans. The armor did a wonderful job of hiding her face and body from me; I wondered how much her prettiness had been a factor in how I interpreted everything about her.

She pulled a clasp on the side of her neck and slipped off her helmet, revealing a slightly sweaty face. Yup, she was still beautiful enough to make me weak in the knees. “You’re going to have to decide what it is you’re going to specialize in, sooner rather than later,” she said.

“I know,” I replied. “It’s kind of moot now though, since I don’t have the time to train up anything.”

“To me, that indicates that you should have decided a week ago,” said Amaryllis. “I don’t want to push you to do something that you’ll regret, but you have four points to spend now. That’s enough for you to double your ability in Blood Magic, or if you wanted to become blade-bound you could do that too, but Joon, you need to stop waiting, because there’s a chance that we’re going to die in the next hour because of your indecision.”

That hit me like a kick to the heart. After Arthur had died, people had always told me that it wasn’t my fault, and I had known that was true, but I still thought about all the things I could have done differently, all the actions that I could have taken to prevent his death, all the little ripples through time of everything I had ever done which had led Arthur to that specific time and place.

And Amaryllis was right. We might die because I decided it was better to hold onto those points instead of spending them. My experience in the game thus far had been routinely running into problems that I had just barely survived, with a dependence on level ups to save my life, and powerful allies to kill my enemies. That did not indicate that this was the time to sit back and be conservative.

“Fine,” I said, the word coming out harsher than I’d planned, “What’s your preference?”

“Everything into wisdom,” she replied. “The strength of blood magic at its upper tiers can be frightening, but even at lower levels you shouldn’t be too far from being able to heal yourself. In the long term, I think sending you to an athenaeum to hone your skills is going to be the right choice, and I spent enough time at the Athenaeum of Quills and Blood to ensure I can help you navigate it.”

That didn’t sit right with me. Not the fact that she had plans for me, though I wasn’t entirely fond of that either; the idea of blood magic being my long-term future just didn’t seem compelling. Blood magic was essentially *ki* magic, and the end game for it, so far as I had heard, involved making swords from my blood and pouring energy into wounds in order to heal them, which wasn’t terribly interesting to me. Or rather, it was interesting, but it didn’t seem like it would crack the world open, and if I wasn’t going to crack the world open, then I wanted something that actually resonated with me.

I didn’t have the problem some of my friends did of constantly rerolling new characters. Instead, I
had the problem of constantly rerolling new worlds. There came a point where I had sucked all the fun there was to suck from a place, and green pastures beckoned. Changing my character class or making a new character didn’t seem like options here, at least not with ‘Diamond Hardcore Ironman Mode’ enabled, so I was sure that I was going to run into that wanderlust problem eventually, but I didn’t particularly like blood magic even now, in part because of the weak, nauseous feeling of blood loss I was starting to get all-too familiar with, and in part because it seemed to pale in comparison to some of the others, especially if I already had the ability to leap twenty feet into the air.

Deciding to go down that path now was like … well, I was going to say like taking an English degree instead of a Computer Science degree, but I guess even if you hate computers and love literature that’s still a fairly reasonable choice given the job market. And I was going to say that it was like playing a healer because that was what the party needed, instead of what you preferred, but I had seen what happened when the tragedy of the commons struck and a party went without a way to regain health. The truth was, there was something to be said for a conservative, boring, sensible option, and maybe I would have gone for that if the description the WIS stat gave itself were more alluring, or hinted at deeper promise. *Wisdom: How much you can mentally withstand. Used to prevent stress reactions, make decisions without emotion, or meditate.* Useful, maybe, but did it even make people more wise in the conventional sense? It seemed more like the mental counterpart to END or POI, given it used some of the same language.

What I was really thinking about was Quills, katana in hand, slicing through elevator doors like they were made of paper and able to advance on five archers and slice their arrows from the air as he went. Amaryllis had said that a standard fireteam included one in their ranks, didn’t she? That meant at the very least they weren’t strictly outclassed by other kinds of magic, not unless there were stupid political pressures from the athenaeums or something like that which forced suboptimal fireteam composition, which would have actually been pretty typical for Aerb.

“I think I’m going blade-bound,” I said, conscious that I was probably giving up an opportunity to increase my loyalty with her.

“Oh whatever you do,” said Amaryllis, “What I care about most is that you do something.”

I closed my eyes and put two points into PHY, raising it and all its child stats by 1, then two points into INS. I’d gotten the “Nascent Blade-Bound” virtue by increasing Parry, and that wasn’t going anywhere until I raised its secondary stat of INS. Putting INS up by two points meant that I would cap at 20, except that *primary* stats constrained at triple the value, which meant that I was going to get to find out what the primary stats were for both Parry and Dodge, probably when they hit 18.

This was one of the options I had been considering for awhile. On the one hand, there were physical increases that I thought were probably good for my continued survival, even if I ended up being some kind of wizard. On the other hand, I didn’t think that this was the sort of game where social skills could be safely dumped, especially not if internal party strife was going to be a theme. INS seemed like the best of the three social skills to me, not just because it was needed to raise Parry and Dodge (by anticipating attacks?), but because getting a better handle on other people seemed like it would solve many of the same problems that CHA would, while understanding and empathizing with others would theoretically make low POI less of a problem.

(The other reason I wanted at least one social ability was that right now, either Fenn or Amaryllis was the party face, and I didn’t quite like how much steering power that gave them, especially since I was still having trouble teasing apart what their individual plans and motives were.)

I was hoping that I would have some stunning breakthrough by doubling my INS. I’d been trying to figure out what each of the abilities would look like if they were maxed out some day, and my imagining of INS was that I would basically be Sherlock Holmes except exclusively for social situations, able to tell that someone had unresolved issues with their father because of the way they clicked a pen twice before signing a contract. I got nothing like that.

Of course, I knew Amaryllis already. Her father had been an old man when she’d been born and died when she was two years old. It wouldn’t have taken the magical deductive powers of a Sherlock Holmes to guess how she felt about that; he would have been a shadow over her life, a man who her culture defined as her protector, gone before she could know him, and maybe she resented him for it, or maybe she’d made peace with it, or she venerated him because of the things he’d accomplished and the fact that he was never around to fuck things up and prove he was human. Or maybe she just never thought about him at all, because she was too focused on the needs of the present and future to worry about the past.

I did wonder how much of that I would have been able to think through a few minutes prior, when INS was 2 instead of 4. You probably didn’t get social superpowers from a single level’s worth of points, but you had to get something, right?

“Good,” said Amaryllis. “Now if we die, at least I’ll know it wasn’t because we were conserving resources for future fights. Cold comfort in hell, I’m sure.”

“We’ll make it through,” I replied. “I haven’t failed a quest yet.” I smiled, and she gave me a weak smile back, which was enough for me to start thinking that 6 Loyalty meant something.

Fenn ruined the moment by slipping into the room with us, her breathing slightly hitched.

“All right,” she said with a smile. “We have some good news. The first bit is that there are only four people, plus the pilot who’s staying well back, which means that we’re at even odds. And if you can do basic math you’ll be thinking that I said four when there’s only three of us, but the second bit of good news is that one of the four is their warder, and they’re just bending the wards, not breaking them. So if we fight inside, that means three on three. Our third bit of good news is that they’re not true professionals, like Mary thought they would be. If these lot were hired by the same fucks who sent me to die in Silmar City, I’ll buy a hat. And fourth is that since they’re just bending wards, they keep having to circle around the place to find new windows, because the tunnel they’re putting in the wards sucks.”

“And the bad news?” I asked.

“I didn’t say there was bad news,” replied Fenn. She took her bow from her back and casually checked the string. “Of course, now that you mention it … their leader is the gold mage of Barren
Gold mage? That had been part of my week-long briefing, but … was that the one that reversed time? No, those were revision mages, gold mages used actual metallic gold somehow, and I couldn’t quite remember the details, in part because there was a confusing jumble of ideas about it in my head and I wasn’t sure which one was right. I was pretty sure that they weren’t a Mistborn rip-off, but the metal tribes which were loosely adapted from that series did exist in Aerb, confined to their own section of the world.

“Telekinesis won’t protect him from a void rifle,” said Amaryllis. *Oh right, tactile telekinesis, that was the gold mage thing.* She was holding her sword, but had the rifle slung across her back.

“No, gold mages don’t have a defense against the void, that’s true, not unless you count flinging a coin at your forehead before you can get a shot off,” said Fenn. “But the second bit of bad news is that they have a revision mage with them. He’s penny-ante, from the way he’s being treated, but I’m pretty sure he’s got the power to patch up holes faster than you can make them, at least if we’re talking about the rifle.”

“And what’s the third piece of bad news?” I asked.

“I can’t blame you for following the pattern, little human friend,” said Fenn. “But the unaccounted for member of their little group didn’t do or say anything that would let me peg her. I’ll grant that’s bad news in its own right. She had a blade, but she had a pistol too, which makes me hopeful that she’s just meant as backup muscle for the gold mage.”

Amaryllis chewed on her lip for a bit. “I agree that these people are probably not from the Lost King’s Court,” she said. “You know for sure that it was Barren Jewel’s gold mage? He couldn’t be from somewhere else?”

“It was him,” said Fenn. “Accent, clothing, and description all matched. I took the lay of the land our first day there.”

“Then who would these people be?” I asked.

“We were thinking that someone from the Lost King’s Court, probably one of Larkspur Prentiss’ people, came here, set up a ward of detection, then left,” said Fenn. “They’d have to figure out that you have the teleportation key to think of Caer Laga, but maybe, since the scene we left back at Sorian’s Castle could have been a bit more subtle.” She ran her black-gloved hand through her blonde hair. “However, there’s no reason that there couldn’t be a standing detection ward around Caer Laga, laid there by someone else.”

“The resources that would take,” Amaryllis began, then stopped, thinking. “A gold mage, based out of Barren Jewel, ferrying a warder he doesn’t have to pay for her labor … maybe.”

“Giving it the personal touch, as it were,” said Fenn.

I rubbed my face. “I’m not sure that I understand this,” I said. “If they’re not specifically after us, then what are they doing here?”

“Well, no one said they weren’t after us,” said Fenn. “If I were one of the top ten richest, most powerful men in Barren Jewel, and I’d been making the investment of flying out here every year or so with a trusted warder in tow, I’d have been doing it so that I could sidle up to one of the scions of Penndraig when she most needs my power and resources. Favorable position for a trade or contract and all that.” She paused. “Alternately, it would be so that I could capture or kill that scion in
exchange for a reward from her enemies.”

Amaryllis closed her eyes and sighed. “I think you’re right. I also think that this fight isn’t winnable as it currently stands, only avoidable. Which means that it’s time for diplomacy.”

“Did you miss the part where I said that he might be here to kill you?” asked Fenn. “Aumann is supposed to be fairly ruthless.”

“Let me know if you think there’s a better option,” said Amaryllis.

Fenn grimaced. “I was preferential to the kill everyone approach,” she said.

We made our way through Caer Laga, which was partly lit in most places by the sunlight coming through the thin windows. There were light fixtures set into the walls, but whatever source of power this place once used, it was long-since dormant.

“They’re up ahead,” whispered Fenn, her ears giving a slight twitch. She had her bow out and arrows at the ready. “Based on what I saw before, they shouldn’t be able to push past where we are now. Ideal conditions.”

Amaryllis cleared her throat and spoke to the bend in hallway, raising her voice. “Isaac Aumann,” she said. “My name is Amaryllis Penndraig, tenth of her name, Princess of the Kingdom of Anglecynn. I hold claim-in-fact of Caer Laga, one of my ancestral homes, which you are intruding upon.”

There was silence for a moment. “You’ll forgive me, princess,” came a mellow voice, “but it would appear that our tunnel into your wards doesn’t allow us to speak face to face. I’m sure that is a matter of coincidence rather than any mistrust on your part. Would you mind terribly marking me as a friend so I could gaze upon your legendary beauty?”

“I think for now it would be better if we didn’t meet face to face,” said Amaryllis, keeping her voice hard. “A gold mage by his nature cannot be disarmed.”

“Oh, well I wouldn’t dream of asking you to put yourself at a disadvantage,” replied (presumably) Aumann. “If you have weapons and armor I wouldn’t insist on you disarming and disrobing as courtesy might dictate. Friends allow each other the freedom to be rude.”

“And that’s what you consider yourself? My friend?” asked Amaryllis.

“Every stranger should be considered a friend until there’s reason to do otherwise,” replied Aumann. “It was the Lost King who said that, was it not?”

“The quote is apocryphal,” said Amaryllis. I guessed that it was authentic though; when Arthur had been playing Uther Penndraig, he’d said it often. “I’d like to know why you’ve come to Caer Laga, so we might discuss terms.”

More silence. “I suppose by now you’ve noticed some trouble with teleportation,” he said. Amaryllis looked to the two of us, but of course neither of us knew what the hell he was talking about, unless he had set up the tattoo mage to sabotage the teleportation key, which … well, which seemed like the sort of convoluted plan that you’d see in a videogame to enable the plot, when I thought about it for a few seconds. “My warder can explain it better than I, but the wards on Caer Laga are now hundreds of years old, and contained a number of defects that later wards do not have, namely regarding the barriers against teleportation. The long and short of it is that you’re not going to leave here until and unless it’s on the say-so of my warder.”
Amaryllis had narrowed her eyes. “You set a trap to extort the next member of my line to arrive here,” she said. “You … were not acting on recent information?”

“An unhappy coincidence,” Aumann replied. “I understand there is less for you to pay me with, since you are, of late, impoverished. Still, I should think that you didn’t arrive here entirely bereft of heirlooms. Pass them to me and I will lift the secondary interdiction, allowing you to be on your way.”

“They’re useless to you,” said Amaryllis. Her jaw was set. “Heirlooms respond only to my bloodline, and you wouldn’t be able to trust those which have been given over through investiture.”

“Oh, well, the value of a thing is not in the personal use one obtains from it, but in the value placed on it by others,” Aumann replied. I could practically hear the smile in his voice. “I would, naturally, be willing to sell them back to you when we are both in a less confrontational mood.”

Amaryllis clenched her fist. I had no idea what was going through her mind, aside from perhaps the indignity of being blackmailed in what was supposed to be a secure base of operations. I was also a bit confused; the reason that we weren’t able to teleport out was that the tattoo was malfunctioning (or had been sabotaged), and that was skin magic, not teleportation magic. We’d been miles away from Caer Laga the first time we’d tried retrieve the key from the tattoo, and it seemed unlikely to me that an interdiction would extend that far.

Which meant … what, that the tattoo had been sabotaged, and then Caer Laga had been separately sabotaged by a different party, one which apparently thought it was playing a different game with us?

I put down my can of Mountain Dew, gave the group my best evil smile, and began chuckling. “You fools, so quick to believe that I would be willing to put your vile past behind us, so ready to believe that others would fall for the self-righteous fictions you’ve spun for yourselves.” I steepled my hands. “The meal you’ve just eaten was poisoned. And with that, my son’s death will be avenged.”

Tiff made a T with her hands, which we had started using for “timeout, I am speaking out of character now”. It was just the four of us, with Arthur gone for mock trial. Craig would show up later in the night, without explanation, like he often did.

“Yes?” I asked.

“We still have the tongue-wigs, right? The little bugs that we replaced our tongues with, along with the glamour on them?” she asked. “I’m pretty sure those were supposed to eat all poisons or something with their alien biology.”

“Yes, you have them,” I said.

Reimer looked up from his notes. “They confer poison immunity.”

“Yes, they do,” I said.

“So …” said Tom, before belatedly making the T symbol. “I don’t get it, why is he poisoning us?”

“You had a long conversation about this,” I replied. “You killed his son during the werewolf epidemic, before you found out there was a cure.”

“No,” said Tom, “I mean --”
“He’s trying to poison us,” said Tiff. “He just picked a strategy that was never going to work on us, because no one knows about the tongue-wigs but us. Makes sense, from his point of view.”

“It’s about frickin’ time,” said Reimer. “You remember that rogue I built, and then we spent like three months real time fighting only things with sneak attack immunity?” He brought that up a lot. “Sometimes things have to go our way.”

“It’s not really about that,” I replied. I wished that Arthur were there, because I knew he would be able to word it better, and I knew I was about to pull back the curtain a little bit too much. “People need to have their own plans in motion that don’t have anything to do with you, that imperfectly counter your strategies because they don’t have the right resources or information. So, imagine Count Gardner, distraught over his son, angry with the Vibratos for absolving you, and plotting his revenge. He hates you, sees you as a law unto yourselves, which you pretty much are, and he wants you to die, right? So he decides that you’re all foolish enough to sit down to dinner with him, if he made the right monologue about how it took him some time to put the past behind him. He does his own research on poisons, talks to various alchemists, pulls black market sellers up from his dungeons to acquire some for him, and after a significant amount of planning, time, and money, he gets you all to ingest powdered green-elk horn, its flavor perfectly masked by a combination of herbs in the meal you just ate. He called you self-righteous, but right now, that’s his sin. A cleverer man, or one less consumed by retribution, would have just waited until you were dead and not gloated about it. Then the poisoning fails, for reasons that he couldn’t comprehend.”

“I stand up from the table and say the command word to materialize my blade,” said Reimer. “Not today, Count Gordner.”

“We’re going to need to gather some proof of this,” said Tiff. “Probably not smart if we kill another noble and only have hearsay in our defense.”

“Either way, roll for initiative,” I replied.

Trying to work backward a little bit, and extrapolating some, this was Aumann’s plan:

1. Use exploits on unpatched wards to set up a second anti-teleportation ward on top of the first that would allow people to teleport in but not out.
2. Set up a detection ward to find out when someone comes into Caer Laga.
3. Wait until someone teleports in.
4. Arrive triumphantly at Caer Laga and extort whoever is there.

This didn’t seem like a terrible plan, except for the part where he’d be making an enemy for life with a powerful branch of a powerful family, and the other part, where he would have to be ready to face down whoever came into Caer Laga. The problem was that we needed more than just him lifting the interdiction on teleporting; we needed him to give us a ride in his helicopter. Telling him that was probably a bad idea, because then he’d know he had more leverage than he’d thought.

“Your ultimate aim here is money,” said Amaryllis. “Not power?”

“They’re the same for a gold mage, you know that, princess,” said Aumann.

“You know that my family line has fallen on hard times,” said Amaryllis. She turned and began miming to Fenn, holding out her right hand and touching her amulet, then pointing at my sword. “Aside from those heirlooms that were waiting in the vault, of which there were only two, I have little of worth to give you.”
Fenn was already moving into action, touching the amulet for ten seconds until it disappeared into the glove, then touching the void rifle on Amaryllis’ back, then touching her bow, then moving to me. I wasn’t quite willing to give up the Anyblade though; instead of handing the sword over, I shrunk it down to the size of a toothpick, made the blade as blunt as possible, and stuck it in my mouth, held firmly between my teeth. Fenn shrugged, disappeared her quiver (which would have looked mighty suspicious with no bow) and then slipped off the black glove and stuffed it down into her dirty robes.

“If you take those two heirlooms from me, I will be left with nothing,” said Amaryllis. “It’s unlikely that I’d ever have the money needed to buy them back from you at a rate you’d find acceptable. I came to Caer Laga to get a toehold of power and wealth back, from which I would be able to retrieve what remains of my interests elsewhere in the world. If I hand my heirlooms to you, it’s over for me, and if it’s over for me, you gain nothing from this venture.”

“Fine,” said Aumann. “Then hand over the teleportation key.” Part of me wondered why he hadn’t asked for that in the first place, if he thought we had one (which we only technically did).

“I don’t have one,” said Amaryllis. “I walked here from Barren Jewel and climbed the cliffs. If you circled around the outside of Caer Laga, you’d find my blood and an open window.”

I occurred to me only then that Amaryllis had been using exclusively ‘I’ instead of ‘we’ as she spoke. Now she was claiming that my blood was hers. To me it seemed to put her in a weaker position for negotiation, especially since she was going to need to mention us eventually, and while the flip side was that we were a card left to be played … well, I wasn’t sure how that actually helped too much, given that it was an ‘unwinnable’ match even before we’d stowed our weapons.

It took some time for Aumann to respond. “It appears you’re telling me the truth, or at least part of it,” he said. “The unhappy fact of your family’s fall from grace has made this venture much less profitable than I’d imagined. Unless you had something in mind?”

“I want passage by helicopter back to Barren Jewel, as a show of good faith on your part,” said Amaryllis. “After that … I told you that I intended for Caer Laga to be the first stepping stone on a climb back to power. I would be willing to make an alliance. There are four hundred eighty-six heirlooms bound to my line. Two hundred thirty-seven of them can be invested or otherwise shared. I am offering power, if we can have mutual trust.”

I could see Fenn mouthing ‘no’. Amaryllis held up crossed fingers. Was that the universal sign for ‘I’m telling lies’, even on Aerb? Either way, Fenn seemed to accept the assurance.

“A good first step to mutual trust would be for you to grant me a bridge past this ward,” said Aumann. “I’m getting somewhat tired of speaking without seeing your face, and I’m sure my warder doesn’t appreciate holding this tunnel open for so long.”

Amaryllis winced at that. Her sword grip was at her side, the blade hidden in extradimensional space, or wherever it was it went off to when she willed it away. She looked to me and Fenn, shrugging. Fenn put her hand sideways and waggled it. I slowly, hesitantly, put a thumb up.

“Fine,” said Amaryllis. “Just you though.”

Moments later, a bald man with mottled red and white skin poked his head out from around the corner. He smiled when he saw us, then strode forward. He was wearing bracelets made of small metal balls, and a necklace of the same design. His suit was close-fitting and made of what I assumed to be silk; his feet were bare.
“You didn’t mention friends,” said Aumann, looking us over. “Quarter-elf?” he asked, looking at Fenn. His eyes dipped to her clothes for a moment, which were stained with blood and had some holes where the fairies had bit her. My own clothes were in a similar state of disrepair.

“Hrm,” said Aumann. He looked at me, but apparently didn’t find me interesting enough to comment on. “Your passage to Barren Jewel does not include those two.”

“Yes, it does,” said Amaryllis. “They are trusted companions, invaluable to me.”

Aumann made a show of scratching his chin. “The helicopter doesn’t have more room,” he said. I could still hear it, though it was somewhat distant, flying high, I assumed, in order to avoid the monsters that were surely sniffing after it.

“Two trips then,” said Amaryllis. She took her helmet off and cradled it in one hand.

“My, I can see why they say such things about you,” said Aumann. “They make a mention of your beauty every time your name appears in the newspapers, which is often, of late, at least for those of us interested in foreign affairs.” He looked between me and Fenn. “Two trips? That sounds fair to me, though it comes at some risk and expense.”

“I would, of course, need one of your people to stay back with them,” said Amaryllis.

“Whatever for?” asked Aumann. Then he laughed. “Oh, I see, as insurance. You worry that I would renege on our deal and leave them as stranded as you were before I showed up. Tell me, what was your plan for leaving this place?”

“We were placing faith in the power of a helpful stranger,” said Fenn. (I had resolved to keep my own mouth shut, at least partly because there was a sword in it.)

“Well, I’m afraid I won’t be agreeing to keeping one of my people back as a hostage,” said Aumann. “I’m not averse to this partnership, but there are a few too many imponderables for me to stick my neck so far out.”

“I’m afraid I must insist,” said Amaryllis. Her grip on her sword hilt didn’t quite tighten as she said it, but her tone did enough that it felt like she was promising consequences. I was hoping that was a bluff, because by the way the girls were acting, I didn’t think she could win a fight against him, if it came to that.

Aumann grinned. “If I leave, are you planning for another to come along and rescue you?”

“We would figure something out,” said Amaryllis.

Aumann held out a hand and the metal balls that made up his bracelet shifted and split, following the contours of his skin and rolling along until they lined up in place on his hand. From the way Amaryllis reacted, it was the tactile telekinesis equivalent of pointing a loaded gun at us. She was too far away to strike at him with a sword, but her helmet was off anyway, and if I was treating the metal balls on his hand as bullets … well, it didn’t look good.

“It’s clear to me now that any relationship between the two of us would largely revolve around me waiting for you to stab me in the back as soon as you had accumulated enough power. You have two options,” said Aumann. “I can kill your minions with two pulses of power and then take you with me by force, perhaps after a brief fight that you would almost certainly lose, or you can submit to my hospitality and allow these two to, as you said, figure something out.”
Amaryllis hesitated. Having 4 INS didn’t help me figure out what was going through her mind, leaving me with only guesses. Her options weren’t good either way. I was pretty sure that if Aumann was tanking his chances for a peaceable alliance, it was because he intended to use her as a negotiation chip with those who wanted her dead. There was also the more horrifying option, which was that she would be subjected to torture and coercion until every last bit of use had been wrung from her.

She set her sword hilt on the ground, where it materialized its blade.

“So,” said Fenn. “As it turns out, the correct strategy was to wait them out.”

“Shut up, for once in your life,” said Amaryllis. She turned to me. “Juniper, I hope you know that my trust in you goes beyond numbers. This is only goodbye for now.”

I responded with a nod. Shit, she actually thinks that I can somehow save her.

“Come along,” said Aumann. “I’ll treat you nicely if you promise not to bite.”

Watching Amaryllis walk away with him filled me with the painful but not unfamiliar sensation of helplessness. Aumann kept an eye on us the entire time, until finally they rounded the corner.

“Might have gone better for her if she hadn’t stuck her neck out for us,” said Fenn with a sniff.

“You still have the bow,” I said. “We can follow and end him.”

“If I thought that would work, I would have done it without you needing to say it,” said Fenn. She sat down on the ground and crossed her legs. I heard people talking from around the corner but resisted the urge to follow Amaryllis. She had accepted the deal and taken the best of two bad options. “Looks like it’s just you and me now.”

“She can still beat them,” I whispered, as the voices beyond us faded. “They’re going to be in a helicopter and she has the immobility plate. All she needs to do is wait for it to get going at speed and then turn it on.”

“Which, at best, crashes the helicopter and drops her into the desert where the thaum-seekers would assuredly be waiting,” said Fenn. “Sit back, relax, and we can think about things when they’re gone.”

“This can’t be it though,” I said. “I was supposed to fly that helicopter. Narrative convention dictates that I was supposed to fly that helicopter, I have a fucking very specific skill in my backstory, mentioned to both of you, and what the hell, I don’t get to fly the helicopter? This is garbage. There wasn’t even a fight.”

The sound of the helicopter was getting closer. I wanted to yell at Fenn to grab her bow and shoot the thing down, but that would only force a fight that neither she nor Amaryllis had thought we could win, and in conditions that were less than ideal.

“You understand that this isn’t a game, right?” asked Fenn. “The world doesn’t follow narrative conventions, no matter what kind of black magic is fueling your rapid learning and incredible healing.” She hopped back up to her feet. “She’s gone. She made sure we had some gifts for our troubles. Unless you think she’s going to turn the tables around and come back to rescue us, which knowing that one isn’t entirely out of the question, then it’s me and you for a bit, and that means that I need you to understand this thing we’re in right now as reality. You stop thinking like you’re in a game, or a story, or whatever it is, because that’s not what’s going to help us, alright?”
The sound of the helicopter began to recede into the distance.

*New Affliction: Cowardice!*

*Quest Accepted: Your Princess is in Another Castle - Amaryllis has been captured by the gold mage of Barren Jewel, Isaac Aumann. Find her, rescue her, and there might even be a kiss at the end.*
Like a Glove

It was the first time I really felt like Aerb had failed me. It hadn’t exactly been fun before, though parts of it certainly were, and it hadn’t been easy. And for all that, I wouldn’t even say that it was particularly gamelike, just maybe able to be mapped onto a game. This garbage? This felt like I was sitting through an unavoidable cutscene where Amaryllis got taken from me, and there was nothing that I could have done.

Maybe what I was supposed to have done was go full shonen anime. On hearing that we weren’t likely to win the fight, I should have given a rousing speech about going beyond the impossible and kicking reason to the curb, or believing in the heart of the cards, or being the very best there ever was. I had a really hard time believing that the result of that would actually have been a victory. Aumann hadn’t really known who he was going to find at Caer Laga, and he’d come anyway, probably because he assumed that he was strong enough to fight whoever was there.

While I was sitting propped up against the wall, feeling sorry for myself and idly changing the Anyblade’s form, Fenn pulled out the black glove and began depositing things onto the floor.

“There,” she said, when the clonal kit hit the floor, “This is what we have to work with. Box that makes something from someone’s profession, jar that’s slowly filling itself with marzipan fairies of healing, artillery bow, amulet that we don’t know what it does but neither of us can use, void rifle, and extradimensional glove. Plus a sword that can be any sword we want it to be, which doesn’t seem all that much more helpful than a dagger.”

“No obvious plan is jumping out at me,” I said. “We had all this stuff when Amaryllis was still here. If there was a way to escape Caer Laga and get back to Barren Jewel, we would have found it then.”

“We weren’t in dire straits then, plus there were things going on,” said Fenn. “Look, I’m not good at the pep talk thing, so if you want to just go ahead and assume that I consoled you about whatever it is that’s upsetting you, it would probably work out better for both of us.”

“I’m sorry,” I said. “I’m just not seeing it.” I looked at the laid out items. “You’re missing a few though. We have Caer Laga and its wards, we have packed up furniture, we have everything else there is stashed away here … at least the clonal kit can make us proper food so we don’t have to eat fairies.”

“See, isn’t it better to focus on something?” asked Fenn. “I think tricking the clonal kit is the right path to success here. All we need to do is think of the right travel occupation. Oh, or maybe we could make some gems!”

“Gems,” I said.

Fenn touched the top of the clonal kit, screwed her face up in concentration, then opened the box. Sitting inside were eight small gems, six of them in the colors of the rainbow, arranged in a circle on the wooden bottom of the box, and a clear diamond next to a black jewel in the center.

“Ta da!” said Fenn. “Alright, now do your thing.”

“Um,” I replied. “Am I correct in thinking that you want me to learn gem magic, right here and now?”

“Yes,” said Fenn. “That’s your whole thing, right? The reason that the princess has, or had, such a throbbing erection pointed your way? To hear her tell it, you were able to give yourself a three-year
“I was under the impression that gem magic was more of an offensive tool,” I said. I reached into the clonal kit and pulled out the diamond, looking it over. I wasn’t an expert on gems or how they were cut, but this one seemed to be unpleasantly asymmetrical, as well as being quite small.

“Yes,” said Fenn. “The important word there isn’t offense, it’s tool, as in a thing that we can use, if need be. If you’re strong enough to grasp a diamond and shoot the white light, that might be enough to stave off thaum-sucker attacks for a few hours. That’s not a solution, but it might be part of one.”

I grasped the diamond in my hand. I had seen a gem mage, as it happened, back in the bathhouse. He’d been naked, jumping into the air, blasting a thick beam of red light at someone who was presumably his attacker. Cut and polished gemstones had power to them, which mostly came out in the form of light, with variance in them produced by the color, cut, clarity, and size. It was on the more systemic end of magic systems I’d learned of in Aerb, though I didn’t know the full set of rules that governed it, nor how to get my start as a gem mage.

I tried a lot of analogies, since those had been helpful in the past. “Think of X as Y,” seemed like a good starting point for trying to conceptualize most of the magic I had come across so far, maybe because it was borrowing from familiar mental pathways. I wouldn’t be surprised that those analogies were wrong on a fundamental level, like most analogies were, but they were still helpful in me gaining skill. None of the analogies I thought up helped me though. Really, I’d been hoping that the answer would just be the first thing that I thought up, because Aerb was infused with my memories, preferences, and intuitions, or at the very least, I was warped in such a way that I could make predictions about the world.

Gems were not the light pouring from them, they weren’t filters, they weren’t lasers, they weren’t faucets, they weren’t distillations of power, they weren’t a color wheel, or anything else I tried. No matter what I did, I couldn’t feel even the smallest scrap of latent power from them, not even for a moment, which meant I never had a crack to dig my fingers into and pry the magic open. Maybe one of those analogies really was right, and I just didn’t have a firm enough grasp, but either way, I put the gems down after half an hour of trying everything I could think of. In retrospect, it had been wildly optimistic for me to think that I could learn a new school of magic just from base principles and a handful of reagents.

In the meantime, Fenn had been making her way through Caer Laga, looking for things of use. She brought everything that wasn’t nailed down to a large room off the hallway I was practicing in, placing things noisily down with the glove.

“This glove is great,” said Fenn as she watched me put the gems down in the box. “It needs a name though, all the best magic items have names. Shadow Fingers? Sable Palm? No, neither of those are right, I’ll think on it. I assume from the lack of searing light that you’ve had no luck with gems?”

“None,” I said. “Did you find anything we can use?”

“Furniture, mostly,” said Fenn, “I’d assume that it’s a few hundred years out of style, if I knew anything about fashions of the rich and famous. There are a few pieces of art, but from what I can see they took all the stuff that was worth anything, leaving behind whatever was not worth the cost of transport. I did find a much more mundane armory, probably the place where hired help would keep their equipment. Most of what was there is gone, but a few pieces remain, probably as part of the emergency retreat plan. There is a kitchen, with nothing in it, there are bathrooms that I assume lead to a dry septic system somewhere, there are pipes stuck to the walls, probably put in after construction, that I know lead to a cistern near the top of the fortress, confirmed dry, and there are bedrooms with no mattresses.” The armory was a boon, but other than that, it was more or less what
I expected.

Fenn held out her gloved hand and a metal box came crashing down to the ground next to her.

“I also found a lockbox with half a million obols worth of paper money, stocks, bonds, and gold,” she said with a smile. “That’s the kind of find that would normally get my heart hammering, except that we don’t have any way to get back and spend it. Yet.”

“It’s something we can feed the kit,” I said. I paused. “That seems like a lot of money.” I wanted to tell her that in the first editions of D&D, experience points were awarded based on number of gold pieces obtained, but I held back, because it was of interest only to me. It annoyed me to not be able to share things like that. I would have said I missed my friends, but I didn’t even really have that many friends left on Earth.

“It is a lot of money, to the likes of you and I,” said Fenn. “To the ruling class of Anglecynn, not so much. A cool half million, locked away for years? Well, no problem, there’s a whole lot more where that came from. I don’t mock her for being spoiled without cause.”

“She was captured,” I said. “I would appreciate if you were a little less flippant.”

“I suppose I can make the effort, for the boy I’m probably going to die with,” said Fenn. “But do you know what I think we’ll find if we get back to Barren Jewel? I think we’ll climb up the tall castle that we think she’s sequestered in, and when we get to the top, we’ll see twenty or thirty dismembered bodies, with your princess standing in the middle of them, dressed in her fancy armor and with her fancy sword coated in blood.” She was getting into this, talking faster and with more animation. “Then she’ll turn her sword off and the blood will fall to the ground in a perfect little line, and she’ll look at you and say, ‘What took you so long?’” The impression she did of Amaryllis was terrible.

“I think her situation is a bit more dangerous than that,” I said. I looked down at the clonal kit, then at her glove. “Do you think that the extradimensional space of the glove counts as latent or passive magic?” I asked.

“No clue,” said Fenn. “Our dear Mary would know, I’m sure, bless her heart.”

“I’d think that it depends on how it functions,” I said slowly. “I don’t know how extradimensional space is defined on Aerb, but if the glove is magically folding space around it, I’d assume it’s passive, while if it’s sending things somewhere and then calling them back, I’d assume that it’s latent when not in use and active when it’s calling or retrieving. That’s the distinction that the thaum-seekers care about, right? Your bow isn’t a magic bow to them until it does something magical, just like my blood is just latent blood until I do something with it? I guess the glove is black, but I’m not sure it’s supernaturally black, since we have vantablack on Earth.”

“And what, exactly, are you thinking, human?” asked Fenn with narrowed eyes. “We obviously can’t take things out of the Obsidian Hand while we’re in the desert, for fear of calling the thau-smuckers to us. We can take whatever we’d like from Caer Laga, because I’ve yet to find an upper limit on what Raven’s Claw can pack inside it, but how does that actually help?”

“You need a single word name for it,” I said. “The adjective-noun construction says that you’re trying too hard. Just call it Sable.”

“And what is it you want to do with Sable?” asked Fenn.

“Well,” I said. “You know how you said we should never travel by glove again?”

“Yes,” Fenn said slowly.
“Well, I’m thinking that we might be able to travel by glove the entire fifty miles back to Barren Jewel,” I said.

“That’s,” said Fenn. “I’m trying to think of the word, but stupid doesn’t seem to quite cover it. You’d have to … well, first of all …” She stopped again, not seeming to know where to start.

“I can list the objections,” I said. I was momentarily frustrated by my lack of pen and paper, before realizing that we had the clonal kit in front of us. I laid my hand on it and tried to figure out what profession would get me what I wanted. Scribe? I opened the box to find a quill, a sealed pot of ink, and some thick papers. I closed the box again, not quite satisfied with that, in part because I had no idea how to use a quill. Computer, that was a profession here, right? I opened the box and found a slender pen and thin, scratch paper.

1. Is the glove latent magic or passive magic?
2. Can the glove be used on its own wearer?
3. How can we move the glove fifty miles … … in the right direction … … without the ability to control it?
4. How can we breathe for long enough to get to Barren Jewel?
5. How can we ensure the thaum-seekers don’t get us?

“So,” I said, “That’s two things that I think we can test fairly easily, and a few problems to solve, but we’re closer than we were before.”

“How are we going to test whether the thaum-suckers will go after it?” asked Fenn. “You know even less about wards than I do, and I have no idea whether we’ll be allowed back into this place if we leave. Amaryllis gave us something like a guest right, but do you normally allow your guests to freely move in and out of your house?”

“Okay,” I said slowly. “So we get some string.”

“You are not throwing this glove out the window,” said Fenn. “It’s my friend. I’ve named it.”

“Do you have a better idea for getting across the desert?” I asked.

“We climb down the cliff and walk,” said Fenn. “Like we’re not actual, legitimate morons. We have the clonal kit, it can make us as much food and water as we need, especially now that we have money to feed it when it gets hungry.”

“And you’d be willing to leave the glove behind?” I asked. “Because if the glove attracts the thaum-seekers, we aren’t going to be able to move with it. We need to figure it out either way.”

“I hate it when other people are right,” muttered Fenn. “Okay, but we’re going to dink around with the clonal kit for long enough that we get some really good string.”

The clonal kit was actually sort of a pain. You couldn’t ask it for specific items, all you could do was think of a profession that had that item as part of its “standard” set of tools and materials. You couldn’t just grab an awl, you had to think “leatherworker” at it. This alone wouldn’t have been so bad, but there were some professions that were either too specific or just not recognized. On top of that, the way we were using it was basically generating a “kit” and pulling a part of it out, then “repaying” the box for what we’d taken.

“Two problems,” said Fenn. “First, this fucking thing does not give us the change we are due, and second, it’s absolutely gouging us.”
“Probably to prevent arbitrage,” I replied. I got a blank look. “One of the problems with a magic item that can create things is that people will try to sell those things. The clonal kit has a restriction on that already, in that you have to pay it back for what you created, but that could still lead to other problems. Say you know the clonal kit values pliers at 12 obols, and you find a place where you can sell pliers for 14 obols, then all you’d have to do is sit there, make a kit with pliers, take the pliers out and sell them, then put some of the money back in the box, making a profit indefinitely.”

“Well, until the guy you’re selling pliers to has enough pliers,” said Fenn.

“Sure,” I replied. “But then you move on and figure something else out, and that becomes your profession: figuring out what the box values things at, then finding someone who will buy them for less. And that’s … not really what games are about. Or at least not D&D.”

“That’s ridiculous,” said Fenn. “You’re positing this world where … what, magic items have no value?”

“No,” I said, “That’s not it at all, the value they have is always about adventuring, not about setting up shop somewhere and becoming a boring merchant who spends his days with his nose in spreadsheets. Or ledgers, whatever you guys use here.”

“But that’s not this world,” said Fenn. “People with magic set up shop with it all the time, that’s practically the entire function of magic. I keep forgetting that your entire life in this world covers about two weeks, but Fireteam Blackheart? They are not the norm. Amaryllis is not the norm, she’s … do you have equalists on Airth?”

“I’m not sure what that is, but there’s probably a correlate, yes,” I replied. “Also, it’s pronounced Earth and I think we’ve known each other long enough that you can stop pretending you don’t know that.”

“Amaryllis Penndraig is everything that the equalists rail against,” said Fenn. “She is basically privilege incarnate, born with power vested in her by her bloodline and by the vast sums of money her ancestors have accrued. Most of that money comes, directly or indirectly, from the heirlooms passed down from the time of Uther Penndraig. You see what I’m getting at? On Aerb, magic items aren’t like what you’re describing.”

“Except this one is,” I said with a nod at the clonal kit. “And there are other ways of limiting utility, if you wanted to. The teleportation key is extremely valuable, so valuable that we can’t really use it to make money because of the risk that someone would come after us and try to take it. Or with some of the others, maybe the market has already reacted to magic being able to do certain things, or a magic item is undercut by existing services, or something like that. The jar of fairies? We could use that to heal people and charge for that, but would we really be making that much money when a blood or bone mage could do the same?”

“Yes,” said Fenn flatly. “You understand that healing you wasn’t cheap, right? If I could set up shop somewhere selling dead fairies, I could live a comfortable life. Not a fancy life, but a comfortable one.”

“And you’d have me believe that you’d actually do that?” I asked.

“No, of course not,” said Fenn. “I’d get bored within a week. Mostly likely I’d pawn the work off to someone else and go for something bigger and better, but that’s me, right? You could give me a goose that lays golden eggs and I would probably get myself killed trying to get a second one. I suppose that’s why I’m out here in this abandoned castle trying to figure out a way to get back to civilization, instead of in Barren Jewel working a trade.” She sniffed. “I suppose that’s also why I’m
on board for rescuing the princess.”

“Really?” I asked. “Then let’s go throw a glove out a window.”

Except that it wasn’t actually that simple, because things kept getting in my way. The first problem was finding the right kind of material to anchor to the glove. We ended up settling on thick, cabled wire, which took about thirty different iterations of looking in the clonal kit to get. Second was the problem of fashioning some way of attaching the glove that would absolutely ensure that the glove wouldn’t slip off once we threw it out the window. In the course of making a holder for the glove, my engineering leveled up, which led to …

“You have to practice it up,” said Fenn. “If your life were on the line, would you go up against someone with three swords when you could have ten swords by holding off a few hours?”

“Three levels and ten levels?” I asked. She nodded. “No, I guess not --”

“Then you have to make sure that the number in your head is as high as it will go before we try this, and we’re still doing a dry run first, with a different, non-magical glove,” said Fenn. “And stop looking at me like that, I know I’m being too cautious.”

“It’s not that,” I replied. “You’re being paranoid, that’s good, I just … didn’t expect it from you. I am a little worried about how much time we’re going to eat doing all this stuff, especially given what might be happening to Amaryllis.”

“She’ll keep, even if they resort to torture, which I don’t think she’d let it come to,” said Fenn. “I know you’re sweet on her, but we have to trust that she can hold her own. For now, stupid experiments with gloves.”

“She knows about the things we have,” I said. “All loyalty and emotion set to the side, the longer we wait, the more likely she is to reveal that we’re here, which means a repeat visit from the gold mage, which … probably doesn’t end well for us, does it?”

“Fuuuuuck,” said Fenn. “Alright, point taken. But I’m not letting you lose this glove.”

Skill increased: Engineering lvl 10!

New Virtue: Material Analysis!

Material Analysis supposedly allowed me to see “weak points”, though I noticed nothing terribly obvious when I started looking around (which made me really hope that this wasn’t one of those things silently disabled by Verisim mode). It certainly didn’t flash red on anything or give me a targeting reticule. I could see the weak points of Fenn, the places where I could hit her to inflict the most damage, but I’d been able to see them before getting the virtue. Still, better to have than not.

Skill increased: Engineering lvl 11!

Skill increased: Engineering lvl 12! (Skill capped at triple the value of primary stat CUN.)

“I think now would be a great time to put more points into cunning,” said Fenn, when I informed her of this fact. That was when I realized that I hadn’t told her.

“I already spent those points,” I said.

She frowned at me. “Amaryllis got to you, didn’t she?”
“I wouldn’t put it like that,” I said. “We didn’t know exactly what we were going to face and I didn’t want to hold back when I’d already been having too many close calls, so … yeah, she talked to me, and I spent the points.”

“Ugh,” said Fenn. “And you didn’t end up spending them on something useful to our current situation, perchance?”

“No,” I said slowly. “I put them toward becoming a blade-bound.”

“You dummy,” huffed Fenn. “It was either cunning, knowledge, or luck, those were the three you should have done, and I have to tell you that luck is something this plan seems entirely dependent on. Doesn’t cunning say that it’s about being smart and solving problems? Isn’t that what we’ve spent the last however many hours doing? And I haven’t even agreed to this! I still think we’re probably better off just going for a walk.”

“I think we underestimated the thaum-seekers,” I said. “We ran up against one and couldn’t get out of trouble without calling dozens more toward us by using a limited resource. If that had happened while we were halfway across the desert, we would have all died. Do you think otherwise?” Some of that was down to my critical failure, but certainly not all of it.

“No,” said Fenn. “But I’m going to help train you up before we go, either way we decide on. You’ve got to get better with a sword.”

It was already set in my head though. I hadn’t just been doing nothing while I increased my engineering, I had been using tools and materials from the clonal kit to build a rocket, which was mostly done. I had a very slight advantage from having a short-lived stint in the school rocketry club (mostly at Arthur’s insistence) but I had no internet to consult for a guide, and the clonal kit either couldn’t or wouldn’t produce books for me to read on the subject. My plan was starting to get some details; build a rocket, give it wings, make sure that it can glide on its own, figure out how to get fifty miles of distance, and then --

“How’s it going to get anywhere near Barren Jewel?” asked Fenn. “I don’t trust your aim at something fifty miles away.”

“Radio,” I said. “Took a bit for the clonal kit to give me one that had its own power source, but eventually I got one from a ‘park ranger’. I’m not sure how to do it just yet, but there are broadcast towers in Barren Jewel, which we’re going to be flying towards --”

“Inside the magical glove,” deadpanned Fenn. She had done that test herself; yes, she could use it on herself, putting her into the extradimensional space and leaving the glove to drop to the floor.

“-- and the fact that we’re flying toward the radio signal helps us, because I can set up reflectors on the glider that will allow totally analog alterations to the rudder orientation without anyone needing to control it. We don’t need pitch or roll, in theory, just yaw.”

Fenn stared at me. “Just how much did leveling up engineering help you?” she asked.

“That’s just the plan,” I said. “It’s the implementation that’s going to be tricky. You can say that you’ll set up circuit conditions all you want, but actually doing it, and in a way that can survive at least some of the unexpected … that’s a lot more difficult.”

“You wouldn’t have thought of all that this time yesterday though,” said Fenn.

“No,” I replied. “Definitely not. I think that engineering might be like magic, where just a little bit of training gets me past the first few years that I’d have to sink into the thing. I’m at fifteen with one-
handed swords, but from what you said I’m only a bit above being competent. But for blood magic, I’m far past where Amaryllis ever was, and she was in the athenaeum for three years. If I got, say, the equivalent of a bachelor’s in mechanical engineering by raising it to twelve … I’m not sure.”

“Competence is on a scale,” said Fenn. “You’re better with a sword than most people who’ve ever held one. They’re not much used in armies anymore, but I’d favor you against the average foot soldier, before even taking into account your magical blade. You’re likely to surpass my ability soon. Of course, bows are more my thing, for obvious reasons, and you have a ways to go before you match me there.”

Not long after that, we finally threw the glove out the window after three different test runs to make sure that we could get it down past the barrier and then pull it back up. That all went smoothly, and no thaum-seekers showed up, which was the last barrier of resistance for Fenn. I think that fear of the thaum-seekers was what finally pushed her in my direction; it was clear now that we couldn’t fight off even one, not without using magic.
Rocket Man

It would be another three days before we were ready to go, which meant that Plan Glove-Rocket didn’t actually save us any time as compared to walking through the desert, but at least part of the delay was from all the time that Fenn wanted me to spend training. I didn’t like it one bit; I kept imagining that the worst was happening to Amaryllis and had to reassure myself that she was tough enough to handle things on her own.

“Hooman, it was your dumb choice to focus on blades,” said Fenn. She held a slightly rusted sword from the armory in her hand. “I’ll be damned if we’re going to try this escape plan without you as good as you can possibly be.”

“I’m already better than you,” I said. I was keeping the Anyblade as a simple longsword, but some testing had showed that I was equally proficient with it in any form it took. The skill was One-Handed Weapons, not simply swords, which meant that I could wield an axe or dagger with equal ease. The feeling of switching between them was a little bit unsettling, since I had muscle memory for things I had never done before.

“Yes, you’re better than me now,” said Fenn. “But you’re not going up against me, you’re going up against a suicidally ferocious beast that cut off two of your fingers and almost killed you last time.”

That was a fair point, and I kept my complaints to myself after that. I even embarked on some independent training of my own, which was to test the limits of blood magic as far as putting speed into my stride. All it really took was using Sanguine Surge with every step and trying to angle myself so that I was gaining horizontal speed instead of vertical. I had hoped that I would unlock another spell, but apparently it didn’t count. It was six drops of blood for every step, which meant that I could actually suffer from blood loss if I tried to run all out. I didn’t get a good grasp on my top speed, mostly because the longest corridors in Caer Laga were curved and the largest rooms were too short.

It wasn’t all building things and training though. We took breaks for eating and sleeping, naturally, but we also stopped to talk.

“Can I ask about the scars?” I asked. We’d finished a bout of sword-fighting and were both somewhat sweaty and breathing hard. I had capped out Parry at 18, as planned, which revealed its primary stat as SPD, a minor (and predictable) bit of new information.

“You can ask,” said Fenn. “And by my measure, just did.”

“You said that they were non-functional,” I said. “I wasn’t told much about scar magic.”

“Oh,” said Fenn. “For a moment I was worried that you were trying to get to know me.”

“I was giving you an out,” I shrugged. “I do want to know about you, but not if it’s stuff that you don’t want to talk about. So you either say, ‘here’s some stuff about scar magic’ and then I take a hint and drop it, or you tell me something personal.”

“Can this count as the favor I owe you?” asked Fenn.

“Not a chance,” I replied with a laugh. “You know, I’m really worried that we’re going to get in a fight someday, and you’re going to stop there with a nocked arrow and ask me if shooting the guy charging at me is a favor.”

“Oh, now that is a good idea,” said Fenn. She chuckled softly, then was silent for a bit. I let the
silence breathe and gave her time to collect her thoughts. “Elves,” she began, then stopped, frowning. “People say that elves stop aging when they reach maturity, but that’s not the half of it. When an elf hits about forty years old, that’s adulthood, and adulthood means that their physical form is set for life, unless someone cuts off their hand or brands them or -- you know, that sort of thing. Humans? They change all the time, put on muscle, put on fat, get skinny from malnourishment, they tan, they sunburn, all sorts of things. Elves can get stronger or whatever, they can die from not eating, it’s just that their body does not change, not ever.”

She let out a puff of air. “So anyway, scar magic. The short answer is that you get scars on your skin and they give you abilities. It’s a form of passive magic, a pretty powerful one. You go through the pain of this scarring in very specific patterns, and when you’re done and they’ve healed, you can put your fist through stone or leap up a few stories into the air. The problem with it, aside from the perfection of technique needed to do the scarring right, is that the scars themselves need to be positioned properly upon the skin, and if the skin changes too much, the magic gets lost.”

“So elves use it more than other races,” I said.

“I’m tempted to say that only elves use it, but I don’t really know,” said Fenn. She sat up some and took off her shirt, revealing her scarred arms in all their glory, their curving, organic looking patterns that must have taken a master to do properly. They were pretty, in their own way, but I wasn’t about to say that to her until after she’d finished her story. “The different types of elves have their own ways of doing things, but among the wood elves it’s a rite of passage. You get your magic scars when you come of age, to say that you’re now unchanging, and anyway, it plays into this cultural thing called ‘fäsh’ that -- well, it’s complicated, but the elves are really big on things staying the same.”

She frowned. “The elves hated me. A lot of my childhood was basically meant to torture me, and I guess that I can only be thankful that a lot of it washed over me because I didn’t fully understand elvish culture. The scars though … I knew that I wasn’t going to ever be perfect and unchanging like them, I had freckles, for fuck’s sake, I had to cut my hair every so often, like, duh, I’m not an idiot, the scars were just going to be scars on me. And I wasn’t even forty, I was seventeen, but they wanted to spit in my face so they decided that I would take the rite early. I refused. They drugged me and did it anyway.”

“I’m sorry,” I said.

“The worst part was that it worked, for the space of about a week,” Fenn continued. “I was so strong, so fast, and it felt so good. Then my skin changed, just a bit, and the scars lost their power, and I’ve been living with them as ornamental ever since. It’s a brand, basically, saying ‘this one, she’s not an elf’.”

“I’d say ‘fuck the elves’ but I worry that you’d take it the wrong way,” I replied.

“No, fuck the elves,” said Fenn. “Not that anyone else is that much better. I grew up getting lots of speeches from elves about how humans were terrible, and lots of demonstrations from humans determined to prove the elves right.” She stood up and stretched. “So that’s the deal with the scars, satisfied?”

“Yeah,” I said. “Thanks. It’s sometimes hard to … to know what you’re thinking, whether you’re just saying things for a joke.”

“Me?” asked Fenn. “Psh, no, never.” She paused slightly. “Did I get a loyalty bump?”

“No,” I replied. “Were you thinking about that?”
“Well, it crossed my mind,” said Fenn. “I never tell that to anyone, I usually say that I was mauled by a bear. I just thought, you know, embarrassing personal trauma, that’s gotta be worth at least a point, right?”

“I think my loyalty to you probably went up a few points,” I said. “But the game doesn’t track it going that direction.”

**Loyalty Increased: Fenn lvl 8!**

Fenn gave me a warm, genuine smile, which she hid by putting on her shirt. I declined to tell her about the loyalty increase, partly because I was worried that it would undercut what I had said. I wasn’t trying to game the system like she had been, but maybe she would see it like that.

I ended up building an entire second glider, work that went much faster than the first one, especially given that I now had what was basically a workshop full of tools and parts in the main dining hall of Caer Laga. It ate up more time, during which I was particularly worried that we’d hear the sound of a helicopter in the distance, or, since gold mages could use their telekinesis to fly, that we’d simply see Aumann walking down the halls. Neither of those things happened though, and I launched the first rocket-glider out the highest window we could find.

We watched as it shot off into the distance, using spyglasses (helpfully provided by the clonal kit) to track it. I was faintly surprised that I was able to judge how far away it was, but I had the Range Finder virtue, which apparently extended to looking at rockets. Eventually I lost track of it, when it became too small to see, but it had been going in a straight line even after the propellant was spent.

“Shit,” said Fenn. “Are we actually doing this then?”

“Yes,” I replied. I could feel my hands shaking. If I were DM, and my players tried something like this, I’d allow it, wouldn’t I?

“All we need is sunlight,” said Craig. “We have the linked portals, right? So we just hold onto one of them and get the other into direct sunlight.”

“Range is a mile,” said Reimer. “London is cloaked in fog out to much farther than that.”

“Okay, so we just send the portal up instead,” replied Craig.

“How?” asked Arthur. “We can’t fly. I know we talked about one of us becoming a vampire and infiltrating their side, but that doesn’t help us in this specific case because we’d have to fly into the sunlight.”

“Step one, steal a cannon,” said Craig. “Step two, point it straight up. Step three, fire one half the portal instead of a cannonball.”

“While we’re inside, fighting Dracula?” asked Arthur. “I guess we could get someone to do it for us, timed to the bells of St. Mary’s …”

“Joon, how high up does the magical fog go?” asked Reimer. “Also, how high up could we shoot a cannon?”

“Three hundred yards is maximum range for a Napoleonic 12-pounder, and the fog rises up to about 300 feet, meaning that St. Paul’s Cathedral just pokes out over it,” which is where I’d planned for the climax of the arc to take place, but I guess we’re not doing that.
“Okay, easy peasy,” said Craig.

“Except for the part where we’re basically subjecting a magic item to ballistic velocities,” said Reimer.

“What kind of a roll would I need to make to know whether the portal would survive?” asked Tom.

“Knowledge arcana,” I replied. He rolled and told me 19. “You think that it would probably survive the firing, especially if you take the time to magically reinforce it, but you have no way to control its descent or prevent it from landing in the Thames or similar.”

“Okay, so, we can’t test it and we have one shot, but it’s certain death if it works,” said Reimer, pinching the bridge of his nose. “And we’re also going to probably lose the portal rings, but that’s a price I’m willing to pay given their restrictions. By my calculations we’ll need some kind of parachute to slow it down once it’s at the apex ...”

They agreed on a plan, and moved on to the next things, which was getting a cannon from somewhere and finding out a way to sneak into Whitehall, where Dracula had set up shop. In the meantime, I was trying to figure out what to do about this cockamamie scheme of theirs. I couldn’t just say that it flat out worked, because then they’d only succeed by DM fiat, and I couldn’t have them fail either, for the same reason, but I’d never liked turning major moments on a roll of the dice, not when we were so far outside the bounds of the systems we were playing in.

So I decided to split the difference.

Fenn had sucked everything up into Sable, and we both wore our breathing gear, which we’d gotten from thinking “pearl diver” at the clonal kit. I touched the glove, which was set into rocket/glider, and Fenn closed her eyes in thought. Ten seconds later, I was in the void.

I don’t think I can properly describe how terrifying that was. Sable was invested in Fenn, not me, which meant that everything I had set up was going to have to be done by her. I trusted her, but I still would have preferred to have been the one to set everything in motion. I was properly equipped for the interior of the glove this time, and spent some time looking around, just to take my mind off of what was going on outside. I had a pocket watch, a flashlight, and the Anyblade, along with a small waterskin. Across my chest was a bandolier with five dead fairies in it. The flashlight was mostly so that I could see without using Aarde’s Touch; I wanted to be in peak condition when we got out of the glove.

We had independently tested everything that we could. I’d spent some time with the radio reflectors sweeping them back and forth across Barren Jewel, watching the rudder adjust itself in response. I had spent an hour inside the glove with the breathing equipment on, just to make sure that I wouldn’t suffocate or get the bends. That still left a lot of area uncovered. We didn’t know for certain that the glider would be able to make it to Barren Jewel. We didn’t know that the mechanisms I’d put in place would allow us to stop. We didn’t know what would happen if the glove were destroyed, but we couldn’t test that either.

A look at my watch showed that a minute had passed, which meant that we were probably off to the races, flying through the sky at ludicrous speeds as we burned through our propellant. I tried to stay calm as a feeling of claustrophobia came over me. Getting out now would mean plummeting down into the desert sand, which meant that the things I had with me were the totality of what was available to me until it was safe to get out of the glove -- and there was no information from outside coming in to us, so the only thing that we could do was time it.
Achievement Unlocked: Outside the Box

Achievement Unlocked: To Infinity and Beyond!

I stared at those two messages for a bit, trying to decipher them. The Buzz Lightyear one was probably because I was flying, though this was a world with planes, so that didn’t seem so exceptional to me, and I had already done a skydive right at the start of the game, which if you watched Toy Story was the kind of “falling with style” that they most often referenced.

“Outside the Box” worried me a bit. Was the game making a comment on my solution to escaping from Caer Laga to complete the Exit Strategy quest? And if it was, what was the “intended” solution, if there was one? How was “Outside the Box” being said? I didn’t have a firm enough grasp on the game’s sense of humor to know whether that was something it would say sarcastically.

So I spent some time thinking about that, then tried to let my mind wander when I wasn’t looking down at my pocket watch. We had agreed on an hour, by which time the glider should definitely have crashed, which meant that it would be safe to exit. In theory, the glider sitting on the desert dunes would be safe from everything but an errant thaum-seeker, so it didn’t matter too much if we left right after the crash or after half an hour. I was sitting in the void, breathing air from a metal cylinder, but I could still feel that opening waiting for me, and I wasn’t dead, so I at least had that going for me. It was claustrophobic, but it was also a little bit calm, right up until the half hour mark.

Quest Progress: Exit Strategy - Your homemade rocket glider has crashed five miles short of Barren Jewel, thanks to a bit of errant sand in the rudder. While the thaum-seekers haven’t been alerted to your presence yet, they’ll be coming for you as soon as you step out of Sable.

My heart started racing as soon as I saw that. It had an unusual amount of specificity, down to the name we’d given the magic glove. More than anything that had happened thus far, this felt like the hand of a Dungeon Master reaching down to set things up for me. Would I have allowed the rocket glider to work, if I were DM? Well, yes … but I would add in a complication. When Craig had wanted to shoot the portal ring up into the sky above the magical fog so that they could use the other end to shine sunlight at Dracula, I had decided that it would work … but not completely, not enough that the encounter itself was trivial.

Alvion’s Word was the name for the magic that protected all of Barren Jewel, and it projected a mile out past the city walls. That meant that we had roughly four miles to go, four miles across hot sand dunes, with thaum-seekers that would be on us as soon as we left the glove. How long had we had, from when Fenn had fired her artillery shot to the others showing? Long enough for me to heal Amaryllis, long enough for Fenn to climb up and keep watch, and it had felt short, but I was rushing and under pressure, so … a low single-digit of minutes?

I moved faster than Fenn when I used my blood to run, and she wouldn’t have any reason to come out of the glove for another half hour, since she wasn’t getting any messages directly from what I’d have to describe as being my own personal god. I could wait and exit the glove with her, but she would just have to go right back in for me to carry her, and if our timing was off, we’d burn valuable seconds when I could be running.

I shrunk the Anyblade down, small enough to once again fit in my mouth, its blade as small and blunt as it would allow. I unclipped the waterskin and unbuckled the tank of air. Was I really doing this? Trying to outrun a creature I knew could exceed a hundred miles an hour?

I stepped out from the extradimensional space of the glove, and the things I’d unstrapped came crashing down. The glider was half-buried in the sand, but the vantablack glove was sitting exposed,
and I pulled it from its casing in a single fluid motion, then put all the motion of my blood into my legs to climb the dunes and get my bearings.

As soon as I saw the smudge of Barren Jewel on the horizon, I leapt again, trying to get as much horizontal distance as possible. I landed on top of another dune and took a moment to get my footing, then jumped again, trying to get into a rhythm, but it was difficult, because the dunes were unevenly spaced. Three more jumps though and I was clear to run on a flatter stretch of sandy ground.

I was surprisingly fast, even given the experiments that I had done in Caer Laga. There I hadn’t had much room to get up to speed, but on the desert flats it was easy to add on more velocity. Before long, the biggest impediment wasn’t the way the sand stole the force of my feet, but instead the air resistance. I remembered reading that for cars at low speed the tires provided the majority of the friction, but that fell away at higher speeds, when it was all about trying to move air out of the way. Cars were designed with airflow in mind, and I was just a muscular teenager without the aid of modern airflow designs.

I looked behind me just in time to see a thaum-seeker racing after me, its clawed feet only briefly stepping on the tops of the dunes I’d left behind. I had no idea how fast I was going, but his relative speed made it seem like I was practically standing still. I pulled the Anyblade from my mouth as I ran and reshaped it so that it was a thin dagger in my hand, small enough that it had little weight to it. I was trying to increase my speed as well, but the air seemed too thick, and any effort was wasted on it. (So why wasn’t it a problem for the thaum-seekers? Magic, probably, those snaggle-tusked bastards.)

The big problem (aside from the thaum-seeker and all his buddies surely right behind him) was that I couldn’t watch him and keep my eyes on the ground ahead of me at the same time, and I was moving fast enough that I barely knew where I was going to step before I laid a foot there. I started bounding as the thaum-seeker got closer, using the brief time I was in the air to look back and judge his approach. On the last jump I landed just ahead of him and lunged with the full weight of my blood magic to the left --

**Critical success!**

-- just barely in time enough to Dodge him as his clawed hand swept past me, and like I’d seen at the cliffs, these things had little ability to control their monstrous momentum. He went skidding across the sand, out ahead of me, and tumbled across the ground as he tried to dig his claws into the sand.

But by now there were others visible, converging on the magic that I was putting out, and when I looked at Barren Jewel I could see that I was still two miles away, which meant a mile to safety, which meant … well, that I was going to be sliced to ribbons unless I did something drastic. They were moving too fast and just as I could get crit successes, there were crit failures too, the last one I’d gotten while running enough to twist my ankle.

I dug deep into a well of power I really hadn’t wanted to touch. There was magic in my blood, magic that lay latent until I tapped it, but I was already tapping it as hard as I could. I grit my teeth and focused on another source of latent magic: my bones.

I sucked power from my ribs one by one, tapping each of them for speed, and the burst of movement I got from them was intoxicating. It wasn’t just velocity though, it wasn’t speed, it was *SPD*, the governing attribute for dexterity, grace, and nimbleness. It wasn’t like time was slowing down, but instead like I had a better knowledge of how to use every second available to me. Each rib drained left me feeling slightly hollow, and each was accompanied by a message about an affliction, but I didn’t waste my time reading them because another stolen glance behind me showed that I still wasn’t safe, and just like that I ran out of ribs to pull dry. But *now* I was going too fast, tearing my
way through the air that was solid as a wall trying to stop me, and if I lost the SPD I was certain that I would tumble and fall, so I started pulling from the fingers of my left hand, extracting power from each knuckle in turn, and when those were done, the bones that lay under the palm.

I had finished the bones of my left hand just as I felt a cold pain on my back -- another message at that -- and I pitched forward, into the sand, scraping my face across it as I suffered the equivalent of a major motorcycle accident while going freeway speeds. When I came to a stop, my back was burning with pain and my face was thoroughly abraded, but a wild look toward the thaum-seekers showed that they weren’t after me anymore. I stopped to read the long message printed on my eyes.

*Quest Complete: Exit Strategy - Safely within the protection of Alvion’s Word and in no danger of starving, you’ve made your way back to Barren Jewel. If safety isn’t what waits for you there, then at least it’s a different, more human kind of danger.*

I slumped back onto the ground and with a weak hand reached into my bandolier to take out a fairy and eat it, then again, and again, until I had eaten all five, each one sealing wounds. My breathing slowly came back down to normal and my heart stopping threatening to explode in my chest, but I felt hollow inside. To my surprise, my hand and ribcage felt no worse the wear for having been drained with bone magic, but at the same time, I could feel that there was no longer any magic left there. I checked the glove to make sure that it was okay, then lengthened my Anyblade so it was usable, thankful that I hadn’t had to try fighting. After three seconds, I had my menu open to check on what had happened to my bones, but all that greeted me was this:

*Affliction: Drained Bone (x51)*

After some time had passed with me laying on the sand, I got to my feet and started walking toward Barren Jewel, which was still a mile away. The quest had triggered early, because I could very easily see myself dying out here, especially if I hadn’t had the fairies for some quick (if incomplete) healing. I had also lost a full six thousand drops of blood, some from running and some from the cut on my back, and the fairies hadn’t restored any of it.

What I really wanted was a level up, to feel that golden taste, to be refreshed in body and spirit. They didn’t remove every affliction, and I was skeptical that they would take care of something as drastic as using my own bones for fuel, but just to feel it again, if only for a moment … wasn’t this a major quest? Didn’t I deserve it?

I was a hundred steps from the walls of Barren Jewel when Fenn popped out of the glove, which I’d been carrying, and landed on her butt in the sand. She looked around for a moment, then took off her breathing mask and grabbed the glove from me, which she slipped on with a sigh of satisfaction.

“We did it!” she shouted. “What the hell happened to you?”
I ate from the fairy jar, squeezing their tiny bodies to crush their marzipan internal organs, until I was fully healed, back at 36/36 hit points. My health meter had increased in size when I’d put points into PHY, but I didn’t fully understand the pattern I was seeing, nor did I fully grasp what it meant to have health points, since I certainly didn’t feel like I had more survivability. That was a mystery for another time though, because Fenn and I went back over the wall (using the clonal kit to grab some clean robes) and into Barren Jewel. The warning on Sanguine Surge about sluggishness was definitely holding true, and that wasn’t just because of the blood loss I’d suffered from running four miles using it.

“We should find a different place to stay,” I told her. “Visit the old one, sure, check for messages there, but anything Amar - er, Mary knows, it’s got to be assumed compromised. I can see them asking her where she was staying, and her telling them because it was something that didn’t really matter.”

“We’re not going to stay at that hovel, thank you very much,” said Fenn. “No, you and I are going to live the good life. We’re stacked, remember?” She had her bow across her back and her full quiver, but the glove was too conspicuous, so had gone into her pocket. Within the glove was the box containing a fortune. We’d burned through a sizable amount of it paying the clonal kit to make various things for us, but that still left us flush with cash.

“I’m worried we’re going to need it to get Mary,” I said.

“You’re in no shape just now, you need rest,” said Fenn. “Why do you keep getting hurt so badly? Even with the fairies, you can’t keep from hurting yourself in ways that they can’t fix.”

“I saved both our lives,” I said. “I’d think that would get me a bit more credit.”

“I’m sure it was very heroic,” said Fenn. She frowned. “I was going to try being serious for a moment and thank you, but then it occurred to me that I could keep score instead. I saved your life, what, four times now? Against your -- I’m being very generous here -- one?”

“I am too tired to even think about it,” I said. “But I’m pretty sure that your count is off, because I should have two, including this one.”

“How so?” asked Fenn.

“Can we please find a place to stay first?” I asked.

Most of the temporary housing in Barren Jewel was for residents of the city. That made sense when I thought about the fact that teleportation cost the equivalent of $10,000 per passenger, which meant that it wasn’t a cost undertaken lightly. Barren Jewel wasn’t much of a tourist destination either, for obvious reasons, so most of the people who would have need of a hotel, motel, flophouse, or similar would be those who had been displaced for some reason or another and were in the process of finding a new place to live or waiting on construction or repairs. That was where we’d stayed on the first go-around, in a building with maybe twenty units whose owner probably prayed for calamities that would let him fill rooms.

But there were still people who teleported into this city, and those people didn’t always have the favor of someone with a great deal of power and a nicely furnished guest room, which meant that there was at least one place in Barren Jewel that catered to those of means. Fenn and I now counted
ourselves in that group.

The first thing I noticed were the plants in the lobby.

I wasn’t counting the days, but it had been maybe two and a half weeks since we’d left the hellscape that was Silmar City and come to the different hellscape that was Barren Jewel and its surrounding environs. Both were exclusion zones, but at least the Risen Lands had plants, trees, and grass, some of it working its way up through the cracks in the sidewalk of the city or creeping into buildings. In the Datura Desert, nothing grew, and the blight extended into Barren Jewel itself. So I hadn’t seen a plant in quite some time.

Fenn gripped my arm and gently guided me away when I went to go look at one of the palm fronds in the corner. “I’ll excuse it this once, since you’re in rough shape,” she said in a low voice. “Don’t go poking things.”

She paid for our room in cash -- well, she would have to, wouldn’t she, since Aerb didn’t have credit cards, because they were pre-computer? Except didn’t credit cards predate computers by a little bit, they used carbon paper and a machine that took impressions from the raised letters, or something like that. So it was entirely possible that there were credit cards in Aerb, I supposed. Even setting aside the plants, the lobby was stunningly presented, in a way that reminded me somewhat of the bathhouse. Was that a thing in Barren Jewel, to have ridiculously ugly exteriors hiding shining, clean scenes within them?

“We’ll be up in the room soon, darling,” said Fenn. “It’s been a long day,” she explained to the concierge. We had on fresh clothes, helpfully provided by the clonal kit, but we’d had nothing but sponge baths during our stay in Caer Laga. I’d never been big on baths, which felt too much like soaking in my own filth, but right now I would have given quite a lot to slip into a warm tub of water. The feeling of blood loss and overall sluggishness that was overcoming me were another reason not to invest too heavily into blood magic. I couldn’t spend my life like this.

Fenn led me to an elevator and we stood in silence next to an elevator attendant as we rose.

“Better than our last elevator ride by a fair sight,” said Fenn.

“Fewer deaths, certainly,” I replied.

The elevator attendant looked at me, but I hadn’t even managed to pique his curiosity enough for him to raise an eyebrow. Fenn rolled her eyes, but there was a slight smile on her face, and she slipped her arm into mine, though that might have been because I was swaying a bit.

When we got into the room, I flopped down onto the white cotton bed without bothering to change out of my robes. It wasn’t much past midday, but I felt like I could do with some sleep. It seemed like such a pleasant place for a nap too, with cream-colored walls, blue-colored trim, and smooth, slightly cool tiles. Instead of actually doing that, I pulled myself up into a rough approximation of sitting and looked at Fenn, who was undressing.

“Not wasting time now that we have a bed, are you?” I asked.

“This is not for you,” said Fenn as she stripped down to her underwear. “Unless …” she put her hand to her mouth and looked at me with wide eyes. She turned slightly away from me. “Are you propositioning me? Because I’m quite flattered, but --”

“Knock it off,” I muttered, looking away.

“Fine, fine,” she replied with a laugh. “I paid for hot, running water, and I’m going to take advantage
of it.” She removed her underwear and stepped into the private bathroom, which she absolutely could have done in the other order. I heard the sound of a shower not long after and slumped back onto the bed, where I closed my eyes.

I had been invested with the Anyblade, Fenn had been invested with Sable, and we had both been invested with the jar o’ fairies and the clonal kit. Investiture was a complicated thing that varied from heirloom to heirloom, but I had been assured that we had at least a month left before we risked losing any of those four, and most likely we would have them until either Amaryllis cut a magical mental tether or some while after she had died.

(Heirloom entads were inextricably tied to the people who had inherited them, and they couldn't be divested of them by anything short of death. This had all the obvious knock-on effects you would expect, like incentive to kill someone with a lot of heirlooms if you were the next in line, and a concentration of power in the hands of the few, and all kinds of other things like that. Worse, there was a grace period between when entads were created and when they became bound to a person or a line, which meant that entads concentrated in the hands of people with power and money, helping to create solid dynasties like the one that Amaryllis was a part of. In his lifetime, Uther Penndraig had amassed a huge quantity of them, one which the Lost King’s Court had been the beneficiaries of. Strangely, and as one of the grand and impossible things that Uther had made his stock and trade, he had untethered himself from his stockpile before his long trip, leaving everyone ever after wondering whether he had ever truly died, or whether he would return to Anglecynn in its time of need.)

I could take some solace in the fact that our four magic items continuing to function properly was very weak evidence that Amaryllis was still alive, somewhere in the city. The fact that we hadn’t been visited by a helicopter or gold mage also spoke in favor of her continued good health, because we were expendable if she were under pressure, especially given that our chances had looked grim. On the other hand, the fact that she hadn’t sent us rescue meant that she was still trapped.

We’d have to do some investigation on this gold mage Aumann, and figure out a way to either beat him or steal her away without him knowing, but we knew that he had a warder and a revisionist, probably some others as well, and that’s about where my chain of logic was when I drifted off to sleep.

I woke up from my cat nap when Fenn sat down on the bed beside me, still wet from her shower and with a towel wrapped around her. “Shower’s open for you, stinky hooman,” she said. “Get your rest after that’s done, so you don’t stink up the bed.”

“Don’t leave while I’m showering,” I said. “We have things we have to talk about.”

Fenn flopped down onto the bed. “I have bought this room with our hand-earned loot and intend to enjoy it, at least for a bit.”

I went into the bathroom, which was filled with the warm steam of Fenn’s shower, and turned the water on before closing the door and then stripping away my clothes. The robes were relatively clean, but the shirt was bloody and had gashes through it, and everything was soaked with sweat from the long run. The warm water of the hotel shower was the first time since the ill-fated bathhouse trip that I finally felt like I was actually getting clean, rather than just smearing sweat, dirt, and sand over my body. It was nothing like home, of course, since for one the water pressure wasn’t as good and for another the water had a faint smell to it that spoke of filtration systems that hadn’t gotten everything clear, but it was still a hot shower, taken in private. I rested my head against the tile of the wall and might possibly have fallen asleep like that, just for a few seconds.

When I came out, with a towel wrapped around my waist, Fenn was asleep on the bed, half-covered by a blanket but not enough to be modest, since she wasn’t wearing clothes. Beside her, on a small
table that hadn’t been there before, was a metal plate with two large metal domes, what I had to assume was room service. I opened both of them and took the thing that looked like a burger with too-red meat over the thing that looked like a curl of fried something sitting in soup. I demolished the maybe-burger in no time flat, since it was vastly better than the street food in our first hotel room, rations on the road, and whatever we could convince the clonal kit to make for us in Caer Laga. The thick-cut fried vegetable wafers next to the maybe-burger soon joined it in my stomach. I was eyeing the fried soup thing when Fenn woke up.

“There’s food,” she said as she yawned and arched her back.

I talk a lot about how pretty Amaryllis is, and not as much about how pretty Fenn is, and I would rather just not mention either because they’re people beyond how attractive I find them. Comparing them is unfair to Fenn, plainly, because Amaryllis is just complementary to my tastes in a way that goes beyond how pretty she is in general. I thought there was a good argument for the look of Amaryllis being designed, but how fucked up was that to say of a woman, “Oh, she was designed specifically for me”? So even if that were true, I wouldn’t have said it.

Fenn was slender bordering on skinny, somewhat flat-chested, and not very muscular at all, though you wouldn’t have known that if you’d taken a punch from her, because elves laughed in the face of muscle mass, and half-elves at least gave the concept a chuckle. I had thought her scarred arms were pretty, before she’d told me her story, and I still thought that they were pretty, beautiful even, but it was tinted with a sense of “fuck those elves for leaving their mark on you”, and I knew that neither part of that was something that she wanted to hear.

I liked the freckles on her face, more now after days in the desert than when we’d first met, clustered around her cheekbones and across the bridge of her nose. I liked the shape of her ears, her slightly crooked and inhumanly white teeth, and it was all more than the sum of its parts, especially in the way that she smiled and joked. She was pretty, and I don’t want to diminish that by comparing her to anyone.

And this is a really long way of explaining why I was, very briefly, staring at her tits, something that I would normally gloss over because you don’t need to know every little thing that goes through my mind, except that she caught me.

“Oh gods,” said Fenn, covering herself with an arm and laughing. “Were you actually propositioning me?”

I could feel myself blushing, not just because of the implication, but because I had gotten caught being unchivalrous. I turned away from her and looked at the food. “It’s not -- I’ve explained that things are different in my culture, I can’t -- you could be more accommodating to me.”

“Oh I bet you’d like me to be a lot more accommodating,” laughed Fenn. “If you catch my drift? That works as a human expression, for a woman to accommodate a man? As a sex thing?”

“You know damned well that it does,” I said. The flush in my face wasn’t going away. “Just eat your food.”

“On a scale from 0-9, how in love with me are you?” she asked. She leaned forward and grabbed her plate of food and some silverware, to eat on the bed, still without putting clothes on.

Where 0 is not at all in love, and 9 is eternally devoted, heart and soul …

“Are you actually thinking about the answer?” asked Fenn, her mouth half full of food.
“Do you have to undercut absolutely everything?” I asked. “Can’t we just have a serious conversation for once instead of making a joke out of everything?” I was unaccountably annoyed by her just then. I had enough insight now that I knew at least part of the answer, which was that if things were a joke, then they didn’t have to be serious. Her biography had said as much.

“Joon, we have had so, so many serious conversations,” she replied. “Even on the first day we met, when I told you that Quills and company were going to kill us all, do you remember that? I didn’t try to make a joke of it.” She was eating while she talked, speaking around the food in her cheeks.

“Yeah, but,” I started, then stopped, then, “Death shouldn’t have to be on the line for us to have a serious conversation.”

“About this?” asked Fenn. “Even if you’d started to form some pitiable attachment to me, and you could get over the elements of me that are more elf than human --”

I turned back to face her. She was still naked, with a blanket covering her lap and her meal sitting on top of it. She was holding a spoon in one hand, halfway to her mouth, and the fingers of her other hand had soup on them, so she was holding them slightly away from her to keep them from getting on anything. It was kind of ridiculous, and took the wind out of my sails. She watched me for a bit, then continued moving the soup to her mouth and slurped it loudly.

“I’ve explained that we have elves on Earth,” I said. “I’ve told you, elves are, as Tolkien conceived them, basically perfect beings, timeless, practically immortal, just a step removed from angels. Maybe everyone here hates the elves, because of war crimes or just the typical elvish snootiness taken up to 11, or they’re dicks here, but on Earth people like elves, they want to be elves, it’s so common for people to be attracted to elven features that there are whole groups of other people who take it upon themselves to argue that elves represent unrealistic beauty standards, and sure, all that is taking place on the internet … the, uh, global internet of connected electronic computers, sorry, I lost the thread.”

“You were saying that in your culture, being attracted to a half-elf would be a very natural thing, not a perversion,” said Fenn.

“Was that your problem in the past?” I asked. “People who chased after you because you were a half-elf, rather than who you were as a person?” That I could see some Earthian parallels to.

Fenn shrugged. “Maybe at loyalty level seven I’ll tell you,” she said. “And we’ve been ignoring the elephant who’s not in the room, who we’re still thinking we’ll rescue. That’s the real kicker there, the one that would make a true, serious conversation about ‘feelings’ painful for me and awkward for you, if we just laid everything out there like dwarves.”

“Is that a thing that dwarves do?” I asked, partly from curiosity and partly to change the subject. I couldn’t remember how the conversation had started, exactly, but I had lost my footing pretty badly somewhere along the way, and was feeling lucky that her loyalty to me hadn’t gone down.

“Oh yes,” said Fenn. “Dwarves are notoriously blunt about how they see the world.” She slurped some more soup. “I’m willing to make you a deal. I’ll try to respect the culture you come from and its standards of modesty, so long as it’s not too much trouble for me, which it shouldn’t be during the course of us trying to figure out how to help Amaryllis. I know, by now, what gets those particular gears turning in your head, so I will be a gentlewoman and avoid intentionally turning them. In return, I want a light and airy time from you, or as much of one as we can have when plotting against a gold mage and trying to rescue an ally who may or may not be under threat of unspecified tortures.” She paused. “Also you owe me a favor.”

“You just tacked that favor on at the end,” I replied.
“Well the deal seemed a bit too sweet otherwise,” replied Fenn. “I’m giving you one thing that you want and another that you should want.”

“You already owe me a favor,” I said.

“So?” asked Fenn. “We owe each other favors then, that’s fine, do favors cancel out in human culture?”

“No idea,” I said. “Okay, deal.” I stuck out my hand and she shook it, using her soup covered fingers and smiling, then with a pleasant smile lifted her blanket up to cover herself more completely.

None of that actually settled anything, but it did shelve it, at least for a bit.

Let’s talk comic books for a bit, shall we?

Superman created the flying brick archetype of superhero: fast, strong, nigh-invulnerable, and capable of flight. This was all well and good, but it wasn’t at all thematic, and Superman, as well as his successors, routinely defied physics in ways that their powers shouldn’t have allowed. There were geeks who shook their heads in frustration at Superman catching a woman falling from the sky, because obviously her back should have snapped from the force of stopping either way. Or Superman would catch a plane whose engines had catastrophically failed, and these geeks would make long comments about how the chassis of a plane was not at all capable of supporting the entire plane at a single point in its midsection.

The solution to both the thematic problems and the physics problems was to boil Superman and his ilk down to a single, unified power: tactile telekinesis. Superman wasn’t actually invulnerable, he just had a telekinetic force field that projected a few millimeters from his skin, which counteracted forces against him. Superman wasn’t actually powerful, he just subconsciously leveraged his extremely short-range telekinetic power to put force behind his punches. He flew by using telekinesis on himself. He could extend his telekinesis to cover people, applying force to their entire body in order to prevent their death by acceleration, and he could cover a plane to ensure its structural integrity.

Gold mages had tactile telekinesis, and when I’d heard that, Superman had been the first thing that I thought of. (It was Superboy, not Superman, who actually had tactile telekinesis, and there were lots of problems trying to apply it to Superman specifically, simply because of his other powers like laser eyes or cold breath, and the need for him to instinctively use it in certain ways without actually knowing what it was he was doing.)

The reason they were called gold mages is that this power of theirs was tied directly to the amount of gold they owned, where ownership was defined by a magical ritual performed on the gold once per month. Gold mages almost always had vaults that they could securely store their gold within, which they could return to on a monthly basis to re-up their claim of ownership.

This had all been explained to me by Amaryllis back during my weeklong crash course on Aerb.

“So what do we need for me to learn gold magic?” I’d asked.

“At minimum, you’d need a pound of gold,” Amaryllis had said. “The ritual to claim the gold isn’t exactly secret, but it would take some time, effort, and money in order to find a copy. After that, twenty minutes of your time to go through the motions, which would give you some small amount of power. But even if we had the amount of money necessary to induct you into the ranks of the gold mages, there’s a catch, which is that gold magic expects much from you, first and foremost that you maintain some level of gold within your vault, but with some other demands that you’d have to
meet.”

“And if I can’t or won’t?” I’d asked.

“You can get locked out of the magic forever,” Amaryllis had replied. “At this time, I don’t think pursuing that type of magic is a viable option, nor are we likely to tangle with one. Let’s move on to flower magic.”

“So, let’s say that I want to kill a gold mage,” I said to Fenn the next morning, after both of us got some much-needed sleep (in the same bed, but (somewhat) thankfully without contact). We had ordered room service again, and I’d managed to get a very normal-looking breakfast of bacon and eggs, even if the bacon was sliced half an inch thick.

“Hold onto your horses,” said Fenn. “Why do you want to kill a gold mage?”

“I … Amaryllis is being held by one,” I began, but I stopped when I saw her point. “You think that we should go in, get her, and then get out.”

“I think we need to listen to the word on the street,” said Fenn. “Killing that gold mage is not our end goal. I know that’s probably the best path for you to get another level up, and gods help us that might be necessary, but the thing we are actually trying to accomplish is getting Amaryllis back to us. Mostly to make sure that our shiny toys keep on working.”

“Hypothetically,” I said slowly. “If our goal were to kill Aumann, how would we do it? Enough bullets or arrows to overwhelm his power? Forcing water down his throat to choke him out? Poison? Something else?”

“Forcing water down his throat doesn’t work when he can just force it right back up,” said Fenn. “Hitting him hard enough would work, but we’ll have to get some measure of his power, which again, is the value of getting the word on the street. As for poison, he’d probably have found some solution to that.”

“Blood or bone magic?” I asked. Both seemed likely candidates.

“I can’t say for sure,” shrugged Fenn. “Most likely he’s got a few heirlooms at auction.”

“Shit,” I said slowly. “So it’s possible that he’s not only got a version of Superman’s powers, but he also has other magic that we don’t know about, some of which he would have bought specifically to counter plans intended to kill him, and which we wouldn’t necessarily know about until after we actually tried those plans.” I thought back to Count Gardner, my NPC who had failed to kill the party for a very similar reason.

“And, naturally, we don’t have to or particularly want to kill him,” said Fenn. “I mean, I wouldn’t mind it, and I’m sure that you want your points, but he’s probably going to be a bitch to kill, which means why risk it?”

“Levels are how I get better,” I replied. “Even with that aside … in a game, I wouldn’t expect to go in for a rescue mission and not face the named antagonist.”

“In a game, would Amaryllis have been taken from you?” asked Fenn.

“Maybe,” I replied. “It depends on the game. I’m not saying that we have to kill him, just that when we’re asking questions, it might be good to keep in mind that we might be forced to at some point. I would rather fight him on my own terms than see him show up right after we’ve unlocked her cell
door, or whatever.” I rubbed my chin. “Void weapons hurt him?”

Fenn sighed. “Yes. Anything that’s not directly counteracted by force. Or we could cut off his connection to his gold, though I’d think that’s the first thing anyone would try, so it’s what he’s most prepared for, especially if he’s got a pet warder of some skill to make his vault secure. And I hate to belabor this point, but you don’t seem to be getting it. We shouldn’t fight him. There’s a reason that we didn’t do it in Caer Laga. Joon, do you remember those ball bearings he held up to us? He could have shot those at the speed of a bullet. A bullet fired at him? That would just come to a stop against his skin.”

“Okay,” I said. “Point taken.”

“Finally,” Fenn huffed. “What you and I need to do is go out into the world and gather information. The radio says that peace and order has been restored to the city after the Risen Bile were put down, so we should be able to use a little less caution when moving about.”

“So, what, we need to know whether Amaryllis is alive, where she’s being held, what kind of forces or resources Aumann has at his disposal, anything else?” I asked.

“You’re forgetting one thing,” said Fenn. “A thing that I’d like us to do first, as it happens.” She cracked her knuckles and gave me an evil smile. “There’s a tattooist who has some explaining to do.”
My left hand felt slightly numb, but otherwise no worse the wear for having its bones sucked dry of their latent magic. I flexed it every now and then, still suspecting that I was waiting for the other shoe to drop on that score. Bormann would probably know, but I didn’t quite know how to start that conversation, since “actually, I picked up bone magic since I last met you” seemed like it would raise too many questions. I wasn’t sure exactly how much danger that would put me in, but I wasn’t eager to find out. Nevertheless, it seemed prudent to get some answers sooner rather than later. For now though, we had other business.

The tattooist was a skinny guy with exposed arms, each covered in tattoos. It wasn’t really a sleeve, because they were individual pieces, with thick borders of unblemished skin between them. His shirt showed more tattoos on his chest, stopping just above his shoulders. He was actually more or less what I would have expected from a tattoo shop on Earth, except that he didn’t have much in the way of piercings, and he would almost certainly have spent a few years at the Athenaeum of Steel and Sweat. I hadn’t paid him much attention the first time around, since my attention had been more on Amaryllis, and looking back, I had been more worried about the way he was looking at her than I was on him as a person.

(From what I’d learned, tattoo mages came the closest to being a traditional D&D wizard, at least in terms of mechanics. A D&D wizard prepared their spells at the beginning of the day from a set list of spells that they know, and uses them up for whatever purpose as the day goes on. The spells were all defined in the books, and did different things that didn’t always follow that much logic. There was a spell that could make an invisible hand of force, and a spell that could make spooky sounds, but you couldn’t combine the two into one effect, you had to just cast two spells. Tattoo mages were similar; a limited number of fixed spells, limited opportunity to mix and match effects, but a wide variety of spells with diverse effects. The biggest difference was that they scribed their spells on their skin instead of meditating over a spellbook; after a tattoo mage was spent, they’d still have to have a rest, just like a wizard would.)

The tattooist was in the middle of creating an elaborate piece on someone’s back when we walked in. He did a double take when he saw us.

“Busy right now,” he said. There was a slight unsteadiness in his voice. “Come back in a few hours.”

The large, bearded man turned his head toward us and frowned. His eyes were yellow and his nose had ridges on it, but he was close enough to human that I didn’t think it mattered. His ear was tattered, like part of it had been bitten off. I’m not sure it was our intrusion that he was frowning at, because his frown deepened from time to time as the needle moved across his back.

“I think every ‘naeum-trained mage here in Barren Jewel has a story,” said Fenn. Obviously we weren’t going to come back later to make things more convenient for him. “Barren Jewel is an expensive place to get to and an expensive place to leave, two hundred miles from anywhere, which means you probably had to pay into the key system, and I have to wonder why that is.”

“There are people willing to pay your way,” said the man on the table with a rumbling voice. “That’s a story all its own, I guess.”

“I said I’m busy now,” the tattoo mage said. “This takes concentration.”

“You were talking earlier,” said the man he was tattooing.
Fenn smiled. “Zeke, was it?”

“Yeah,” said the tattoo mage. He kept his focus on his work, or at least pretended to.

“Well, Zeke, you and I have a little bit of a problem, because I paid you for services rendered, and come to find out, it didn’t work,” said Fenn. “I’m a knowledgeable girl, studied in the ways of the world, and things like that aren’t supposed to happen. In fact, if I’d thought that was even a possibility, I probably wouldn’t have paid you.”

“I’d need to see the tattoo,” said Zeke. His voice trembled.

“Not an option right now, I’m afraid,” said Fenn. “Not an option specifically because you fucked us.”

“I didn’t,” said Zeke.

“If you’re gonna get the shake down, I’ll come back to have you finish this later,” said the man on the table with a glance backward. “Don’t fuck up the lines because you’re thinking too hard about covering your ass.”

Zeke breathed a frustrated sigh. “Okay, we’re done early then.”

He used a cloth to wipe down the man’s back, then put on some padding while we waited. The man threw on his shirt shortly afterward and strode to the door, stopping briefly by the window to turn the blinds, then flipping the sign on the door from Open to Closed.

“Don’t kill him,” the man said to Fenn. “Need him to finish the tiger.” Was that what that was supposed to be? Then he left us behind, alone with the tattoo mage.

“So,” said Fenn. She paused, then turned to me. “Did you want to give this a go?”

“Um,” I replied, then cleared my throat and looked at Zeke.

Intimidation was capped by INS; it was the only one of my social skills that was. I kind of understood the thought behind that; in D&D, Intimidation was Charisma based, but the game layer here divided out all the social skills in different directions. Intimidation wasn’t Charm, it was more the opposite of that, and it definitely wasn’t Poise, because it wasn’t much about keeping a straight face. There was some elements of those to intimidating a person, but mostly intimidation was about making credible threats that actually got to the heart of what a person feared.

And as Fenn pulled on her glove so black it ate all the light coming at it, reeking of magic, I realized that having me talk to Zeke was part of her intimidation strategy. She was essentially saying, “You’re such a small, insignificant piece of garbage that I’m handing this off to someone for practice.”

“You fucked us,” I said to Zeke. “You know that you fucked us. Now that we’re here, staring at you, it’s obvious to us that you fucked us.” I found myself actually getting mad at him, the more I thought about. “I almost died in the fucking desert because you decided to pull one over on us.”

Skill Increased: Intimidation lvl 7!

“Now hold on,” said Zeke. "It might be interference from --"

I moved forward and punched him square in the stomach, as hard as I could. He crumpled and coughed, gasping for air. I leaned down and gripped him by the neck. “She was my companion you little shit. She might be dead because --” I remembered that I wasn’t supposed to be beating the crap
out of this guy, I was supposed to be asking him for information, “Tell me what you did, and why you did it, and I will let you live.”

**Skill Increased: Intimidation lvl 8!**

Zeke kept coughing, but struggled to his feet. “It’s a variant,” he said, short of breath. I hadn’t realized that I could punch people that hard now. “Keyed to -- me.”

I grabbed his finger in my hand. “You paused,” I said. “Probably because you thought that I would kill you if I didn’t have an incentive to keep you alive, right?” I squeezed his fingers hard and he tried to pull them away from me. He had tattoo magic in his skin, so he wasn’t defenseless, which was part of why it was important to make him think an escalation would result in his death. “Unlike you, I stick by my word. I said that if you tell me how and why, I would let you live. You have exactly one more opportunity.”

**Skill Increased: Intimidation lvl 9!**

I was pleasantly surprised by how quickly the skill was increasing. Level 8 was where the slowdown began, and level 10 was where it became a grind. Maybe my increased Insight was helping, or maybe it was because I wasn’t trying to subvert the system by doing roleplay exercises with a party member, but either way, it was noticeably faster.

“Please,” he said, trying once again to pull his fingers from my grasp. “It’s a variant, keyed to a word. It’s new, discovered in the last few years, the athenaeum didn’t want it spreading because they thought it would weaken the trade, I wasn’t even supposed to know about it.”

“You thought that we were easy marks,” I said to Zeke, staring in his eyes. “We were young, not obviously affiliated with anyone, lightly armed, showing no magic, and we were spending a fair bit of money, so you thought … you thought that you could extort us.”

“Or he’d sell us a story about how he’d have to be paid some money to fix what went wrong,” said Fenn. "That's extortion of a different feather. Not a great strategy in the long term."

“I’ve been scraping together the money to leave,” said Zeke. He looked at his trapped fingers and winced. “You’re right that there’s a story, behind how I got here, it’s --”

“I don’t care,” I said. The last thing I wanted was for him to give me a quest. Gambling debts, a kidnapped sister, running from something … if it were me telling the story, he’d have some kind of humanizing backstory that made sense of his motivations and pointed the players toward something they could do besides just get revenge. I didn’t want to risk that though. “Tell me the word we need.”

“Azalea,” he said. I stared into his eyes, trying to figure out whether he was lying. What calculations were going on in his head? It had to be clear to him now that we outmatched him, even without him seeing the full extent of our abilities and possessions. That didn’t mean that he would tell us the truth though, not if he thought that was too big of an advantage to give up.

“Well, that’s good enough for me,” said Fenn. She moved over to his workbench and laid her gloved hand on a wooden box filled with supplies.

“What are you doing?” asked Zeke.

“I’ll be taking this,” said Fenn, as the box disappeared. “Now, I don’t want to put you out of business, because you’ve been very helpful to us.” She looked around the shop and spotted a second tattoo gun. She grabbed it, looked it over, and as she did, it disappeared into her glove. “And finally,
I think we’ll take half of your, what do you call it? Book of flash?” She looked around some more until she finally pulled a book from under the shelf, which she leafed through. It was a three-ring binder with a number of pages in it.

“No, I need those!” said Zeke, as Fenn opened the rings and took roughly half the pages.

“You need them?” I asked. I punched him in the throat and let go of him so he could topple to the floor. “That must suck to need something and have it held hostage,” I spat. “We’ll bring everything back, unless you lied to us. You still have half your things until then.” I paused for a moment, hand itching to draw the Anyblade from where it was concealed in my pocket. “Tell anyone that we were here and I’ll make sure your death is creative.”

**Skill Increased: Intimidation lvl 10!**

Zeke was on the floor, coughing and retching, so I’m not sure that he heard my message. Fenn slipped off Sable and returned it to her pocket, then went to the door with a cursory look back at me. I followed quickly, feeling awkward about just leaving him there. That hadn’t been part of the plan in my head.

“You went a little hard on him,” said Fenn as we made our way back into the crowded streets. “You also escalated too fast. Treat a man like that and he’ll think his life is on the line, and if he thinks that his life is on the line, sometimes he’ll unleash every scrap of magic at his fingertips. Shouldn’t have to tell you that, since you did the same yesterday.”

I flushed. “Sorry,” I said. “I’ll keep it in mind for next time.”

“Mind you, my experience has much more been one of being on the opposite end of such negotiations,” continued Fenn. “The guard always want you to know that they’ll break your fingers if you don’t cooperate with them. Not that the underworld is terribly kind to wily half-breeds with smart mouths either.” She whistled a few bars. “Would you have killed him?”

The streets were still filled with sights that grabbed my attention, but there was some repetition to it now, and the sense of the familiar was creeping in. The first time I had seen a dwarf, it had been a shock, but the second time, that shock was dulled.

“It wouldn’t have been smart,” I replied.

“Oh, well I can agree with that,” said Fenn. “But was there a chance that you’d do it anyway?”

“It was unfair,” I said. “If people run into problems, it shouldn’t be because of things they had no control over.”

“That is awfully high-minded from someone who punched a man in the throat,” said Fenn.

“He had that and more coming,” I replied. **Besides, that’s the sort of thing that the game seems intent on rewarding.** “But I’m talking about games. If there’s stupid RNG bullshit or whatever, fine, that you can plan around, but why build a thing that just fucks you over for going in blind? And this is the second goddamned time this has happened to us. Counterplots are fine, but not if the player isn’t aware of them.”

“Someone put a hornet in your hat,” said Fenn. “Also, you know me well enough to know that I don’t understand half of what you’re saying, right?”

“I know, just venting,” I replied.
“Besides,” said Fenn. “This is my third or fourth time being in this position within the last few weeks. Do you understand how Silmar City went down from my end? It was me, getting pulled from a jail cell and told that I would be working as a guide for some very dangerous people in a very dangerous place. Once we get there, the information that was supposed to be collected concurrently never came, and other plots going on elsewhere in the world basically left us stranded, except on top of that there was also this missing girl that they wanted to get, whose very identity was a threat to my life, because they couldn’t let me live if I knew they’d killed her. Do you get how many fucking plots must have piled up on top of each other? To be expected from the Lost King’s Court, but please, don’t complain about getting blindsided by plans, not after you lucked your way through Silmar.”

“You’re being very charitable to my luck,” I said.

“I don’t think I am,” said Fenn. “Can you imagine if you ran into Fireteam Blackheart as it normally is, without me in the mix? They’d have extracted their use from you, then ground you into a fine paste. Hell, the elevator ride was elf luck, through and through.”

“What?” I asked. “Are you … that was me! Have you gone this whole time thinking that I did nothing?”

“More or less, yes,” said Fenn. “What do you mean ‘it was you’?”

“I snapped the rope,” I said. “I burnt my hand nearly through doing it.”

We were moving in the direction of Bormann, to have a conversation that I wasn’t really looking forward to. My hand hadn’t gotten better, it still felt numb, and I could feel something similar in my chest. I was also still suffering from blood loss, even if eating my way through high-class room service had done wonders for my constitution.

“Well how was I supposed to know that?” asked Fenn. “Oh, is that why you think that you saved my life twice? I guess I’ll give you that one. You still have some catching up to do.”

“You said four to one before?” I asked. I rubbed my left hand, trying to bring some feeling back into it. “What are the four?”

“Well, number one was the very first moment we met,” said Fenn. “Number two —”

“I would have outrun them, I wasn’t in any danger,” I said.

“Number two,” continued Fenn. “That was me murdering Leonold before he could use the Fool’s Choker against you. Fatal flaw of that particular tattoo is that it makes people really want to kill you to get rid of it.”

“I moved the tattoo,” I said. “And it went off, despite your best effort to kill him quickly.” I was aware that we were being somewhat indiscreet, since we were having this conversation in the middle of a busy street as we walked, but I could barely hear her, and we didn’t technically have enemies right now, since I was fairly sure that after five days Aumann would have written us off, if he hadn’t done so the moment his helicopter flew away.

“Oh?” asked Fenn. “Oh, right, the healing thing,” she said. “That saved you from having your flesh cut up?”

“Yes, it did,” I said. “No thanks to you.”

“And what exactly was the trigger for you leveling up?” asked Fenn. She was looking ahead, not at
me, which made her smile all the more irritating.

“Fine, that one I’ll give you,” I said.

“And of course the other two aren’t at all in contention,” said Fenn. “I shot a porcupine and a thaum-seeker, both just for you.”

“Fine,” I said. “That makes it three to two though, I only need one more to catch up, and I’m sorry to say it, but I’m getting better faster than you are.”

“You don’t hate to say that at all,” laughed Fenn.

It felt good to have her back in a joking mood, after our conversation in the hotel room about what my brain was flagging as high school level relationship drama. Of course, if this place was a reflection of me, or my thoughts, or whatever, then high school level relationship drama was probably to be expected. The “Aerb is all me” hypothesis had more than a few kinks in it though, with the “Coward” brand being one of them.

We arrived at the Kindly Bones and found Bormann sitting behind her desk, putting away a pulp novel that she must have been reading right before we came in. She looked at us in surprise.

“More amateur archery gone awry?” she asked with a faint smile.

“We had a drunken bet that we’d like to settle,” said Fenn.

“You don’t look drunk,” said Bormann.

“Well, you have to honor your bets, even if they were lubricated with liquor,” smiled Fenn. “I’d be more than willing to pay you for your time and expertise, if you’d oblige us.”

Bormann smiled. “I don’t recall whether either of you were mages of any sort, but there are certain secrets we agree not to share when we conclude our training. Now, the law in Barren Jewel isn’t so tight as in other places, but I’ve found that keeping a closed mouth is a valuable skill in my line of occupation, and prefer to do so wherever possible.”

“We’re not looking for secrets, per se,” replied Fenn. “We’re more looking for … well, corner cases, things that a bone mage would know, but which wouldn’t come up for those of us who are only loyal customers.”

“I see,” nodded Bormann. “Well, I’d be happy to answer your questions, but I hope you understand that there are some things I cannot answer, whether because of bonds I still honor, for your safety, or for my own. And obviously discussions of previous patients would be off the table.”

Fenn nodded, then looked to me. I cleared my throat. “Alright, hypothetically, could a bone mage draw power from their own bones?” I already knew that they could, because I’d done it, but I wanted to see her reaction to that before I asked my actual question.

“It’s possible,” said Bormann. Her lips were drawn tight. “It happens, on occasion, if a bone mage is in such a dire situation that cannibalizing their own body for a brief burst of power seems wise.” She looked at Fenn and her eyes widened slightly. “No offense.”

“None taken,” said Fenn. She must have caught my look. “Elves practice ritual cannibalism, mostly on the worst of the worst. It’s the second highest insult an elf can express, the first being to make someone eat themselves.”
“Okay,” I said, blanching at that. “So what happens to the bones, if the power is sucked from them when they’re still inside the body?” Please, please don’t say that it necrotizes.

“It’s nothing you would notice much from the outside,” said Bormann. “The bones become more brittle after the fact, and the marrow within them doesn’t function as it should, which can lead to problems of the blood like anemia, fever, risk of infections, or things like that.” Fuck. “The most interesting change is within bone magic itself. The body will compensate for the loss, given a few months, and strengthen the remaining bones, and to some extent the flesh around them.” She gestured to a few of the larger bones hanging from her shop. “There are specialized farms that perform the procedure on their animals, empowering the others, which are then shipped to people like me once the animal has been brought to slaughter.”

“So,” I said slowly. “A person who had burned through the magic of their rib cage would have a weak point there?” I asked. “But it would be made up for in other ways, given time?”

“You’re speaking of the extreme end,” said Bormann. She was watching me. “It’s not just that bones have a magic to themselves, they’re steeped in, and provide for, the raw essence of a creature. I’m obviously speculating, but if it were the entire rib cage, all twenty-four bones, there would be little way for the other bones to compensate. Weakness of the lungs, heart, the entire digestive system … it would depend specifically on the person in question, their vitality in particular, but I would predict an appreciable decrease in quality of life.” Fuck, fuck. “Perhaps if I knew the nature of this bet, I could help to arbitrate?” She was humoring us, I was sure of it.

“Joon heard this story,” said Fenn. “I can’t remember the details exactly, but the guy burned through fifty-odd bones, all his ribs and every bone in his hand. I said that a bone mage couldn’t do that, and even if they could, they would die soon after that. But you’re saying that he would have been fine, just a little sick from it?”

“Sick for the rest of his life,” nodded Bormann. “The ribs in particular are vital to the production of blood. But I wouldn’t think fatal, not necessarily.”

“How would you fix it?” I asked. I was feeling weak again, not just from the blood loss but from the bad news I’d been delivered. “Are there … bone transplants?”

“You’re well beyond my level of expertise,” said Bormann. “I would imagine that there’d be some solution, in this wide world, but gaining access to it would be another issue.”

**Quest Accepted: Boneitis - You used up the power in your bones and it’s not going to come back without some serious magic applied to it.**

Fuck, fuck, fuck. That quest pop-up meant that this probably wasn’t going away just by waiting it out or leveling up. And not only was I probably going to have a weak spot until the issue was resolved, not only was I going to get sick, but it was also going to screw with my ability to effectively use blood magic.

Fenn clasped me on the shoulder. “Don’t look so glum, you won both halves of the bet, that’s twenty thousand tcher from my coffers to your own.” She turned to Bormann. “And for you, because I like you, and because I admire both your candor and discretion, and because we might have use of you in the next few days, amateur archery being such a dangerous but alluring sport and all, fifty thousand tcher.” Fenn reached into her robes and handed over some money.

“That’s quite generous,” said Bormann, but it wasn’t so generous that she had to refuse.

“What are we going to do?” I asked as we left the Kindly Bones.
“We’re going to find Mary,” said Fenn. “What was the count she gave, something like two hundred that might be given out? I’m sure somewhere in there a solution awaits.” She turned slightly and pointed at a tall cylindrical building, matte grey with windows placed in a miserly way. “That’s Aumann’s place. I was half-hoping that retracing our steps through Barren Jewel would turn up a message left for us, but we haven’t been so lucky thus far. So, we’ll visit our old hotel yet, but that phallic building is probably the place we’re going to try to get inside.”
The Impish Inn

We sat at a small table in the back of the Impish Inn, each with our own glass of something called kefir, a thin, alcoholic yogurt that I occasionally took sips of to try acquiring the taste, a process that wasn’t moving along terribly well. That was okay though, because the Impish Inn was my first real fantasy tavern, and I was trying not to miss anything. There were supposedly around 200 “mortal species” on Aer, but humans dominated Barren Jewel, and they were in the majority worldwide. That meant that I was still seeing new ones all the time, some of which I recognized and some I didn’t, plus the Animalia, which were the anthropomorphic animals. Their forms, like Quills, usually had the bare minimum done in order to get them upright - they were all pretty damned far from human.

The Impish Inn (probably called that for the alliteration, since as far as I could tell it didn’t have rooms for rent at all) had an actual, honest-to-god imp sitting in a cage near the front of the bar. It was a pathetic creature, with a body that came to a point at every opportunity, from his ears, to his nose, to his joints. He reached out with his little hands through the bars and pleaded with people for food or drink, and though I saw a few people indulge it, it never stopped its begging. Fenn had explained to me that creatures came up from the hells from time to time, but that it apparently “wasn’t a real problem worth thinking about”. Apparently not, if someone could keep one of those things as an attraction in a run-down tavern and not have people get up in arms about it.

People mostly stuck to their kind, I noticed. There was a table of hobbits, all of them sitting on booster seats and clustered close together as they shared miniscule drinks. Three bald women with blue hands, vitrics, shared drinks and spoke in low voices, leaning in toward one another to be heard over the din. A pair of large creatures with green-striped snouts sat in specially reinforced seats - after watching them for a moment I concluded that they were on a date, assuming that body language translated properly.

“Not all places are so accommodating as this one,” said Fenn as she watched my gaze. “It’s one of the reasons that people typically gather in ghettos. Special diets, special seats, special washrooms, special everything, it all gets to be a bit much, so most places will simply build for their most common customer, the human, and that’s that. Works for me, but I imagine it’s a bit of a pain if your tail keeps getting in the way everywhere you go. Of course, Barren Jewel is also somewhat unique, because it’s more a place where people end up, rather than a place people go. So far as I understand it, the variety here has been slowly whittled down as the years have worn on.”

I nodded at that. Fenn herself was in robes, which were pulled up like a hijab to frame her face and hide her ears. It wasn’t that I minded her ears, but I thought she looked prettier dressed that way; it drew all the attention to her facial features, her dark green eyes, the way she pursed her lips when she was scanning the crowds, and the constellations of freckles. Obviously I didn’t say any of that.

We were at the Impish Inn to covertly gather information, which we had started on by talking to the bartender and telling him to send people our way. The story we were going with was that we were from out of town and looking to go into business with Aumann, but needed to know more about him and his dealings. The bartender knew who Aumann was and not much more than that, but he’d smiled when Fenn had given him a generous tip and we’d heard him making inquiries on our behalf, not mentioning us by name. As yet, he hadn’t sent anyone over to us.

(This plan was not without its risks; the other plan that Fenn had put forth was that she would skulk outside the building, wait for someone to leave, tail them, and then strike up a conversation with them which would eventually lead back around to Aumann. I hadn’t liked that plan, mostly because
it meant her going off on her own for indeterminate periods of time, and she’d relented without a
fight. We still held the element of surprise, and Aumann was the only one who had seen our faces at
Caer Laga, so I thought meeting people in a tavern was more or less safe.)

“So,” said Fenn, “While we wait, tell me an Earth story. I’ve never heard one before.”

I looked around us. No one was really close enough to listen in. “I’ve told you lots of stories from
Earth,” I said. “Besides, you don’t believe that Earth is a real place.”

“You’ve told me about games that you and your friends played,” said Fenn. “And you’ve gone on
and on about the rules for these games, and the settings, and conceits, and whatever else. But if
Earth is a real place, or at least a fully-realized fiction, then it should have its own stories, shouldn’t it? Tell
me one of those. A story of your people.”

I paused and thought about that for a moment, then launched into one of the stories I thought I was
most likely to get correct, as well as having the least background that would need explaining. Fenn
listened for awhile as we watched the people, sipping on her kefir, but when I got to a certain point
she started paying more attention, furrowing her brow and frowning in concentration.

“And then,” I continued, “Standing over the pit, with his hand cut off, Luke Skywalker says, ‘You
killed my father!’; and the Dark Lord Vader replies, ‘No, I am your father’.”

“Can I stop you there, for a moment?” she asked.

“Sure,” I said. “We’re like, two-thirds through, sorry, I should have picked something shorter.”
Really, I could have stopped at the end of *A New Hope*, but I was having fun, and for the first time
she’d seemed interested in ‘Earth stuff’.

“You haven’t read any books on Aerb?” she asked.

“Just a few paragraphs out of one,” I said. “I’d like to change that.”

“And I would guess that Amaryllis hasn’t been telling you any stories from Aerb?” asked Fenn.

“I’d like to know where you’re going with this,” I said.

“Your story,” said Fenn. “It’s cribbing from *The Star War*. Not just in terms of the plot, but it’s got
some of the names too, and the *lines*, at least all the famous ones, are taken straight from the play.”

I sat back in my chair. “Huh,” I said. I drank more of my kefir and grimaced at the taste, which was
slow to acquire. “Okay, so there are a few explanations for that.”

“Number one,” said Fenn. “Incomplete skewer, changed your remembering of the play into a story
from the place you only think you’re from.”

“Or,” I said. “It could be an easter egg placed by the developers, something that I would notice,
chuckle at, and then look by.”

“If the world entire was made for you,” said Fenn. “You understand why I’m not willing to credit
that utterly narcissistic fantasy, right?”

“I do,” I said. “Wait, there are other dream-skewered, it’s a, a medical condition here, right? The
story could have just come from one of them.” That didn’t seem entirely out of the question, and it
could give a plausible explanation to the mechanism by which the easter egg had been hidden, so
that it wasn’t just developers being cheeky and breaking the world to add in modern day references
… but they hadn’t been all that concerned about that in any other way before now.

“One problem with that,” said Fenn. “The play’s author is famous, and he predates you by hundreds of years. He wrote a large number of plays, as it happens.”

“So?” I asked. “That’s all consistent with the dream-skewer hypothesis.”

“He wasn’t just a playwright,” said Fenn. “He was a ruler, a king. They called him the Warrior Poet, before his heritage was uncovered, and then they called him the Poet King.” She was watching me. I got the sense that I was being tested, but I didn’t know the question, let alone the answer. “Of course, that was before he left on some great quest and never returned. Now, he’s usually called the Lost King. The man who wrote *The Star War*, *The Redemption of Shawkshank*, and *The Ozian Wizard*, among dozens if not hundreds of others? That man was Uther Penndraig, great-great-great-whatever-grandfather to,” she stopped and looked around, “To the nobility of Anglecynn.”

“Holy shit,” I said with wide eyes. “He was dream-skewered.”

“What? No!” said Fenn. “How is that the conclusion that you come to? I’m telling you that the man couldn’t have just been some nut from another world, no offense, --”

“Taken,” I said. “Just for my sake, pretend that Earth is a real place, even if there’s no way to prove that.”

“Fine, I’ll do that, as a favor to you,” said Fenn.

“No,” I said. “You’ll do it because I’ve been very kind in trying not to suggest that Aerb is artifice, and we don’t want to both be pissed off about it.”

“Grumble grumble,” said Fenn, waving her hand. “Anyway. Uther Penndraig was the best swordsman who ever lived. He founded the First Empire. If you were ever to meet one of his spawn they’d be dripping in magic items, and that would be just a fraction of what he gathered in his lifetime. He founded two of the Athenaeums and was a master of eight different kinds of magic. Being dream-skewered might explain him being a poet, playwright, singer, and painter, but he was far, far more than that. Also, if our friend Mary ever asks, pretend that I don’t think he’s that great. Seems like the kind of thing that would really get her goat.”

“So what you’re saying,” I said, rubbing my chin, “Is that Uther Penndraig was the lever that moved the world?”

Fenn sighed. “Ugh. Point in your favor.” She took a swig of her kefir and winced as it went down.

I was thinking about Arthur. I hadn’t told Fenn or Amaryllis about him. When Amaryllis had first told me about Uther, I was sure that my reaction had been noticeable, but she had never asked me about it, instead electing for us to go to sleep. Had that fallen through the cracks, because that was the night I had neglected my watch to go train? Had she misjudged my reaction? Or … or more likely, more in keeping with how she moved through the world, had she made the connection herself and thought it best to leave that card unplayed?

(It maybe says something about how I thought of Amaryllis that I could picture us getting in a fight, and just as I was about to storm away angry or call it quits between us, she would blurt out that her great-great-whatever-grandfather had been a man like me. And she probably knew more about Uther than anyone else I was likely to meet, which meant that she could rebind herself to me, or use her ancestor as a way to bring context to what she had done, if it was necessary, or maybe just throw me off my balance. That imagining of Amaryllis was awfully uncharitable, but she’d left me to die twice
now, and when I pictured her, it was with helmet on, armed and armored, ready to murder without remorse, if she deemed it was necessary.)

But my mind kept going to Arthur. If he had landed in this world, like I had, what would he have done? He’d have sunk into a role, like he always did at the table. He usually played a knight or a fighter, but on occasion he dipped into being a bard. D&D had always been about the worlds for me, the inner workings of the places and people, but for Arthur it had been about the stories. It would be just like him to borrow from the Western cultural canon and leave his mark on this place, to sing the songs he’d heard on the radio growing up, and while no, Katy Perry’s California Gurls would probably not resonate with anyone on Aerb, there were others that would, especially once he was a king and he had a whole court following his every whim. And what would Arthur have named himself in this new world? Why, he would have picked the name of his favorite character, Uther Penndraig.

The dizzying sense of hope was returning to me. That quest, The Lost King, Found? raced to the very top of my priorities. I would need to dig into books, to read up on his life to see what he had been like, to confirm my suspicion that he wasn’t just a king, not just dream-skewered, but a player in this game, that he was Arthur, who I had last seen in a coma, both eyes blackened, with medical wrap over him and cuts on his face. Arthur, who had been my best friend, Arthur, who died too young.

“Whatcha thinkin’ about?” asked Fenn.

“I need a library,” I croaked out. “Or a bookstore.”

“Because of Uther Penndraig?” asked Fenn.

“Yeah,” I replied.

“I already gave you a point, you don’t have to gloat over it -- but we can discuss that later, because we’ve got company,” said Fenn, switching gears smoothly. She waved a hand at a pretty young woman with two small horns on her head. I was fairly sure that she was what D&D would call a tiefling, someone who was at least partially demonblooded. The way she looked at the caged imp with pity made that all the more likely. She was wearing white robes, which were somewhat stained at the hem, and walked to us hesitantly.

“Quinten says that you’re … inquiring? Into Aumann, that is,” she said. She remained standing beside our table.

“That’s us,” said Fenn, “Don’t you worry, we’re just doing our due diligence before we try to arrange a meeting with him,” she said smoothly. “We won’t ask you anything that would risk your job, and you’d be free to leave if you felt that we were crossing a line best left uncrossed.” She pulled a note from her robes and laid it on the table, one marked as worth five thousand tcher.

Obviously we would compensate you for your time, and you’d be free to tell your employer after the fact, though we’d prefer a little more time to gather information before we make our pitch.”

She wavered for a second, looked me over, then took the note and sat down, folding it away. “What would you like to know?” she asked. “I’m only a maid, I don’t know how much I can help you.”

“I’m Emily,” said Fenn, “And this is Sam.”

(I had to talk Fenn out of clever anagrams, puns, or coded messages, opting instead for boring, human names that no one would look twice at. She had eventually agreed that giving away anything
would be stupid. The cleverest pseudonym was the one that said absolutely nothing about the true identity behind it, not even to reveal that there was a pseudonym.)

“Vanity,” she said, doing a good job of ignoring how I looked at her.

“Trifles Tower,” said Fenn. “That’s his?”

Vanity nodded. When Fenn let the silence stretch, Vanity spoke, “He renamed it, it used to be the Clocksmen Tower, until about ten years ago when Aumann took hold of it.”

“Has he been a gold mage long then?” asked Fenn.

“No,” said Vanity. “Twelve years, or thereabouts.” More silence, which again compelled her to continue. “Before that, there were three gold mages in Barren Jewel, always fighting one another, sometimes being replaced. Aumann came in and took over their vaults, one by one. But that was before my time.”

“Any idea how he managed it?” asked Fenn.

“His friends say that he was more cunning and his enemies say that he was more treacherous,” shrugged Vanity. “I know that none of those victories were through direct combat. He seems to take some pride in that.”

Fenn winced. Right, because that means he’s probably smarter than previously thought, and at the very least, someone who studied how to defeat a gold mage. “I’m slightly hazy on ‘the call of the gold’, but it’s my understanding that there is, in some sense, a constant need for accumulation. Do you know how Aumann is handling that need?”

“I think he gets it shipped in,” said Vanity. “But I’m not entirely sure. There’s some talk of it among the staff.” She shifted in her seat. “There is worry that he can’t keep it up forever.”

“And you said that he has enemies?” asked Fenn. “People that might complicate a business arrangement?” I probably wouldn’t have thought to include that last bit.

“The Risen Bile,” said Vanity, spitting to the side. “Others, that are lesser, business rivals, politicians -- I believe the mayor is none too fond. Enemy might be putting it too harshly.”

Fenn frowned at that. “And what do you know of his business holdings?” she asked. “Just in general, we’ll get the full overview from the man himself, I’m sure.”

“He has his thumbs in many pies,” said Vanity. “Two of the cheese factories are his, I know. He won the bid on the bathhouse, so that will be his too, soon. He’s got a fair number of people, a warder of some talent among them, and he himself makes use of his power, helping out when there’s need for muscle.” She looked between the two of us. “But none of that you wouldn’t know from talking to anyone else who works for him.” And in fact, most of that we’d already known.

“The Risen Bile,” said Fenn. “It was my understanding that they were all dead.”

“Mostly dead,” shrugged Vanity.

“So there’s some cleanup still going on,” said Fenn. “And why are moral crusaders so against him? He wouldn’t have acquired the bathhouse until after that attack, right?”

“He tore into them,” said Vanity. “He offered his services to the city guard, free of charge, and made short work of them whenever another group were found.”
Fenn tapped her fingers against the table, frowning. “One last question then, I think. Have there been others, possibly like us? Newcomers from out of town, here trying to make a deal or otherwise bring themselves into his sphere of influence?”

Vanity looked between the two of us. She touched her horns, one then the other in quick succession, then tapped her chest where her heart was. “Twenty thousand tcher,” she said in a low voice. Fenn calmly pulled the money from her pocket and discreetly slipped it across to Vanity, who furtively stuck it in her robes. “He left in his helicopters, five days ago,” she said, leaning forward, voice low. “When he came back, there was a woman with him. Red hair, very pretty. I didn’t see her myself. Whoever she was, the tower started buzzing with activity and hasn’t stopped. People are being moved around, some of them going on trips.” She stood up from her chair. “That’s all I know.”

“Thank you,” said Fenn with a nod. “I think it goes without saying that this conversation won’t come up in the course of our business dealings with your employer, and as you said, it could conceivably have come from anyone in the tower.”

Vanity nodded and then left, hurrying out the door.

“So,” said Fenn. “I’m tempted to call that a whole lot of nothing.”

“She’s alive,” I said. “That’s not nothing.”

“Was alive, five days ago,” replied Fenn. “And we'd figured that she would be anyway. Though 'activity' could indicate that Aumann is going after the buried treasure, and our mutual friend probably gave him the maps, which … I guess we can count in our favor, if we really need a win that badly.”

“So what’s the plan?” I asked. “I’d still like to go to a bookstore, now that the city has settled and we have the funds for it. We can create the gems for gem magic, the only gate left should be an understanding of how to activate them, which I’m hoping that I can get from a book.” Plus, I really wanted a detailed biography of Uther Penndraig.

“We’re not just going to talk to one person and then leave,” said Fenn. “Sam, you and I are going to be staked out here all night. We’re going to use the information we just gained to pry our fingers into other cracks. We can change our story now, say something like, ‘We know that Trifles Tower has had many people coming and going of late and we would like where and why before we go to your master with a proposition.’”

“Too obvious,” I replied. “Even I could see through that.”

“You haven’t even heard my proposition,” Fenn smiled. “I was going to offer a vast reduction in travel costs.”

I narrowed my eyes at her. “How, exactly?”

“I can get around the restriction on the teleportation keys,” she said. “It’s supposed to hold five, no more, but I can move dozens on a single ticket.” She mimed putting on a glove.

“Huh,” I said. “Would that actually work?”

“Well I have no idea, but it sounds like it would, doesn’t it?” asked Fenn. “We obviously can’t actually meet with Aumann, and obviously he might know about the glove, but it’s plausible to other parties, which means that it works as a story. Hopefully they just accept the money and don’t pry too deep.”
I frowned. “Wait, is that kind of thing done often?” I asked. “That glove can’t be the only magic item that uses extradimensional space.”

“What kind of life do you think I lived, Joon?” asked Fenn. “I’ve traveled by key four times in my life, you were there for one of them. It’s expensive. No, after my father was killed, I did some wandering, but I spent most of my time traveling back and forth across the Risen Lands, finding things to loot and then selling them in civilization.”

“Huh,” I said. “I guess I just assumed …”

“What, that I had been back and forth across the empire, seeing its sights?” she asked. She shook her head. “I wish that were true, for my own sake, because it might mean a better life led. Now, I was trained by the elves, who hated me but wholly believe in the value of doing a good job, and I have met my fair share of dangerous people, but no, this whole experience is quite novel. Mostly in a good way, though I could do with a few less threats to my life.”

“You and me both,” I said. I touched my chest briefly. I wasn’t feeling too bad, but I was sitting down, and worried that I might get dizzy when I stood up. It was, I was fairly sure, a symptom of blood loss, rather than fucking up my chakra or whatever it was I had done to my skeletal system.

“Do you mind handling this alone for a bit?”

“And where would you be going, my young companion?” asked Fenn with a raised eyebrow. “Little boy’s room?”

“Bookstore,” I said. “No sense in both of us sitting here all night. We’re on more of a time limit than we were this morning.”

“You’ve tired of my companionship already?” asked Fenn with a smile, but it wasn’t a very funny joke, and there was an edge of sadness there so faint that I might have been imagining it.

“You’re my best friend in the world,” I said, which was the truth. “I’ll be back before you know I’m gone.”

Fenn reached into her robe and withdrew a few thousand tcher, which she passed to me. “I’m not going to be your mother hen like our Mary would, but … tread carefully out there. You won’t have me to back you up.”

“I won’t get into any fights that I can’t handle by myself,” I smiled, then left before she could object. She’d have preferred I stayed, clearly, but spending our entire night waiting around for people to come in so we could have brief, coded conversations with them … that didn’t exactly sound like my idea of a good time, especially not if we were going to be drinking kefir, which I was pretty sure was made from Barren milk.

I wandered, trying to keep track of landmarks. The streets in Barren Jewel were haphazard, same as they’d been in Silmar City, following organic, branching paths instead of a nice, American grid. That marked this city as predated automobiles, or maybe just meant that its original construction predated urban planning. There were almost no cars in Barren Jewel, though I had seen a small, three-wheeled, motorized vehicle I recalled as having a ridiculous name. Tuk-tuk, maybe? There were animals as well, rideable birds and once a lizard, though those were rare too, and from what I had seen, more of a status symbol than practical transport.

I found an old, worn bookshop called Another Chapter, with a warren of books and a shopkeeper at the front with a cash box nestled beside him and his attention on a worn paperback. The books showed only faint organization, but what they lacked in order, they made up for in volume, with
narrow aisles so that there could be more books. I was halfway down one of them, reading titles, when the shopkeeper realized that someone had gone past him. He called down the aisle to me.

“Can I help you?” he asked. I saw his thumb was stuck in his book.

“I have a list,” I said. “It starts with a biography on Uther Penndraig.”

An hour later, I had fourteen books piled high in my arms:

- **From Farmer to Founder** - A biography of Uther Penndraig, written a few decades after he had become the Lost King, though the copy I was getting had the language updated to be “more modern”. (Fun fact, apparently Aerb had linguistic drift, which was confusing given that people were clearly speaking English.)
- **The Complete Works of Uther Penndraig** - A book that collected everything that Uther had written in his life, including poetry and songs. It was about a thousand pages thick, and a quick look at the index showed that there were numerous adaptations of Earth works, as well as a few original pieces, mostly related to military, magic, or politics.
- **The Dream that Skewers** - You can probably guess the subject of that one. Reading the first page was enough for me to get a sense of the book as Gladwell-style popular science, but it was the only book on the subject.
- **Portrait of the Many Hells** - A book with black and white illustrations taken from infernoscopes, though most of the book was actually consumed with text descriptions.
- Seven books from **The Commoner’s Guide** series, which Yasin, the shopkeeper, told me were more about demystifying magic than actually teaching magic, which was by and large only done at the athenaeums.
- **The Book of Blood** - A guide to the varied races of Aerb, their relationships between one another, and then the bulk of the book, which covered interbreeding, an apparently quite complex issue. (Sadly, it had nothing to do with blood magic.)
- **The Exclusionary Principle, Seventh Edition** - Partly a catalog of the exclusion zones, including a map splayed across the inside of the front cover, and partly a (quite old) treatise on what exclusion was.
- **Fingers of the Celestial Hand** - This was described to me as being five dossiers on the gods, and I checked through it to make sure that it contained relatively little in the way of biography. It was more about the five gods as forces within the world, which I was much more interested in.

None of these were immediately useful, save perhaps for **The Commoner’s Guide** books, of which Warding Magic and Revision Magic seemed germane.

“Quite eclectic,” said Yasin. “No fiction in there, save for Penndraig’s works?” He clucked his tongue. “I can understand the need to study, but surely some escape from the real world would be welcome, so long as you’re in my shop?”

I laughed at that. “I have to imagine that this is already a bigger sale than you normally get,” I said.

“True, true,” smiled Yasin. “But it’s not just about the sale, it’s for your own fulfillment.” He reached over to his stool and picked the paperback up off it, adding it to my pile. “Free, for you.”

I looked down at the title, **The Prince and the Handmaid**. “You were still working on it,” I said.

“I know how it ends,” said Yasin with a smile.

While I counted out what I owed him, he packaged my books, wrapping them first in paper and then some clever knotwork. When I went to grab it, I saw a little card for **Another Chapter** sitting on top
of the bundle, with a note from Yasin saying that he had been happy to help me.

I was feeling pretty pleased with myself as I walked down the streets back to the Impish Inn. I had completed a task, by myself, without getting into trouble or taking direction from anyone. I knew enough about the world to not raise any red flags during a trip to the store. It was a small victory, but a pleasant one. I kept expecting a complication of some sort, an altercation in an alley that I would have to stop or risk another level of Cowardice, or someone recognizing me, or a thief trying to steal my books, but my paranoia was not rewarded.

When I went back into the Impish Inn, Fenn was deep in conversation with a dwarf, who was jabbing the table with a finger. I approached them slowly, not wanting to interrupt, and Fenn gave a subtle shake of her head to warn me off when she spotted me. I was more than fine with that; I unpacked the books and pulled out the biography of Uther Penndraig, which I began to read.
There are many places that one might start the story of Uther Penndraig, but to understand the man he became, it is best to go through his life as he did, one year at a time.

He was born Isiah of Colm, in a farming village so small that last names were not yet in general use. His mother died in childbirth, leaving him to be raised by his father, who remarried when Isiah was two years old. His father was a farmer, and Isiah, along with his six half-brothers and two half-sisters, worked the fields every summer. There is very little written about this time in Uther Penndraig’s life, and he rarely, if ever, spoke of it.

When Isiah of Colm was sixteen years old, the Dark King’s campaign of conquest spilled into Anglecynn. The dark army, composed largely of goblins, orcs, and dwarves, passed through Colm, taking whatever food there was to take from storehouses and killing or conscripting any fighting-age men they came across. Isiah of Colm was in the woods near the family farm when the army came through and returned just in time to see the fresh carnage that had been visited against his father, step-mother, and half-siblings.

In many tellings, this is when Isiah of Colm picked up his sword and began the fight, and while the image is perfectly compelling, with a strong narrative logic to it, historical research does not bear it out. Leaving eyewitness accounts aside, there are exactly two contemporaneous sources by which to trace the arc of Uther’s life. The first are the many grave markers which still stand in Colm, relics of the dark army’s movements, each giving the year of death as 1138 (ed. 9 BE). The second is in 1142 (ed. 5 BE) when Uther Penndraig entered into Greychapel and attempted to pull Avengion from the stone it was lodged in. Aside from those two sources, and a number of eyewitness accounts made years if not decades after the fact, there is no record of Isiah of Colm or Uther Penndraig for that roughly four year period, not within the records left behind by the Dark King, nor in the contemporaneous letters sent to and from the Anglecynn resistance.

This four year gap is something of a mystery. Certainly it would take some time for a sixteen-year-old farmer’s son to properly train with a sword, but proper training would require someone with skill, and the only mentor Uther spoke of having during this time was the flower mage Vervain, who certainly would not have been able to teach him as much as he appeared to know during that first visit to Greychapel, not even with Uther’s relentless quest for excellence, his natural athletic talents, and his inborn skill with a sword.

There is a third contemporaneous record, which I am hesitant to bring up. Several years ago, a number of scripts written by an unknown playwright were unearthed in Anglecynn, all written in the same hand and performed by The Erstwhile Players, a troupe that was active during the time of the Dark King’s conquest and later occupation of Anglecynn. So long after the fact, it is nearly impossible to track the movements of the troupe, and they were hanged, to a member, in 1141 (ed. 6 BE) for subversion of the Dark King’s will, specifically for the performance of a play called *The Fellowship of the Ring*, of which no written copies exist. The other scripts from this troupe, however, do share a passing resemblance to the other, later works of Uther Penndraig, and the handwriting is a close approximation.
It is impossible to say with certitude whether Uther Penndraig was ever a member of The Erstwhile Players, or whether it was he who authored the scripts that have been uncovered. If he was, this paints a very different picture of his path toward taking up arms against the Dark King. A theater troupe during the era of Anglecynn’s occupation would have not been neutral toward the Dark King, they would have been actively paid by him as part of general morale improving efforts, one of the investments the Dark King made into captured territories. Perhaps Isiah of Colm was simply biding his time, spending his evenings drilling with wooden swords and plotting his revenge upon those that killed his family.

Yet in Uther’s own plays, and the commentaries he has written, he focuses on the Call to Adventure of a young hero, and often on the Refusal of the Call, both phrases always capitalized.

I set the book down to think about this. Arthur, if it was Arthur, had been dropped into the world with a family, a father and some siblings, and then the most stereotypical possible thing had happened: the Dark Lord had shown up and murdered his family. That was where the traditional, so-cliche-no-one-uses-it hero’s journey began, with some horrible thing happening that set the hero down the path to righting wrong.

And Arthur (if it was Arthur) had said “fuck that” and gone to seek his fortune in a theater troupe, using his natural affinity for acting, along with his wide knowledge of pop culture ... For three years? Maybe, if he had been smart and avoided encounters, if he’d kept his head down, if, if, if. Or maybe he had been getting stronger in the safest ways he could think of. All I really had to go on was a few lines of guesswork in a biography written long after any of it had happened. But either way, no hero can refuse the call to adventure for long, because at some point they’ll get pushed violently back onto the railroad of destiny.

In the story of Uther Penndraig, that would be the end of the first act, and in the second act he would meet his Merlin.

I looked over at Fenn to see her still deep in a protracted conversation with the dwarf. She was smiling, somewhat ferally, and I hoped that meant that she was getting something good out of him. I went back to my book, still looking for answers, something that would confirm beyond a doubt that it was actually him.

Uther Penndraig arrived in Caledwich, fully formed. Whatever had happened to him in the four years between the death of his family and his first time through the gates of the then-capital, he had become a skilled swordsman and a polished speaker with a stolid determination and a devotion to good. He had met and gained the loyalty of two of his eventual seven companions, those who would later become his Knights of the Square Table. He had Vervain, the flower mage, and Forty-Two, a changeling of ill repute and recent friend. Both of them were, by that point, already sworn to him, heart and soul.

Forty-Two was one of Reimer’s characters, a fairly forgettable shapeshifting assassin loner. His name was part of a boring, tragic, backstory that I won’t get into here. The thing was, this threw a wrench into my “Uther is Arthur” calculus. I really wanted Arthur to have come through a portal five hundred years ago and recreated one of his characters, because that would mean that he was alive. But if there were other characters from our games, then what did that mean? How many of Reimer’s characters had been in Aerb at any point? Had any of them been dream-skewered, or actual people I knew put in the shoes of their characters?

The fact that Forty-Two was a historical figure really made me start to have doubts; that was another
biography I was going to have to pick up, if there wasn’t enough information about him in this one. If he was just Forty-Two, not Reimer-as-Forty-Two, then that was weak evidence against Uther being Arthur-as-Uther. It was also the case that Uther Penndraig was, on both counts, a family name predating him, not one that a maybe-Arthur had picked out for himself, which meant that the world was waiting for him with a backstory already set up.

I kept reading. It was interesting stuff, not just because of the story, but because of the small details that weren’t fully spelled out, things I was supposed to pick up from context. I kept trying to find some definitive proof that it was Arthur in there, that I wasn’t just reading about a preternaturally gifted king going on adventures, but the only threads of that were in the form of the stories and plays he had written. What I wanted to come across was a line where Uther spoke about his best friend Juniper Smith, but I never found it.

I got about a quarter of the way through the book before Fenn came over to me, partly because she was taking forever to wrap things up with the dwarf, and partly because I’m a fast reader. I can give you the Cliff Notes version:

The Penndraig line had been wiped out, down to the last child, when the Dark King had taken Caledwich. The last thing that Constantine Penndraig had done, when the invader was knocking on his door, was to have an enormous rock brought into Greychapel, which he embedded his sword in. The unique magic of the sword made both sword and rock completely invincible, for all practical purposes, and the sword could not be removed except for by the hand of someone in the Penndraig line. Constantine had intended this as a big fuck you to the Dark King, who would have had to spend time and effort removing the affront to his rule, but the Dark King turned it around and said, “Hey, the old king is dead, his line is dead, and here’s definitive proof, if anyone wants to pull the sword from the stone, be my guest, but everyone else, this is your reminder that there’s no royal line left”.

So of course Isiah of Colm was actually the son of a secret princess, and he rolled into Caledwich with a plan, which was to take the sword out of the stone, giving him both claim to Anglecynn and a sweet sword in the process, as well as signaling to everyone the start of a proper resistance movement against the Dark King. As I was reading this, I was thinking that it was pretty fricking dumb of the Dark King to not just take the rock out of Greychapel, for exactly that reason … but then I got to the part where Uther tried to pull the sword from the stone, and failed, whereupon he was ambushed and had to fight his way out with his allies in tow.

As it turns out, the Dark King was at least a little bit genre savvy, and he’d taken the impenetrable rock with Avengion out under the cover of darkness, then brought in a new, specially made, identical rock, with a replica sword stuck in it. It wasn’t just that the sword in the stone was proof that there wasn’t any living Penndraig, so long as people accepted that the sword in the stone was authentic, it served as proof against any potential claimant, as well as a honeypot for would-be heroes. So that was Uther Penndraig’s introduction to the world, which took about two chapters to tell, half of it concerning his parentage, which I wasn’t really that interested in -- all I really needed to know was that he was a secret heir to the throne.

After that, Uther spent about a year recovering from his fight, gathering more powerful allies, including two more of his Knights of the Square Table (one a skin mage, who was named after a bumbling wizard Tom used to play but didn’t seem to share all that much in common with the character, and the other a cleric, though Aerbian clerics were a lot different than in traditional D&D). After that, he went after Avengion again, which he’d discovered the location of. The Dark King had stuck the giant, invincible rock into a lake, and Uther had needed to enlist the help of a magical mermaid to retrieve it. The biographer didn’t call her the Lady of the Lakes, but I could read between the lines; whoever was writing the story, they were cribbing a bit from Arthurian legend.
At that point, Uther was twenty-one years old. The First Empire was founded in 1147 (0 FE), which was only another four years, and a quick look at the index showed that covered about another quarter of the biography. His two sons were born very shortly after the formation of the First Empire, and then he disappeared from the face of Aerb on a quest at the age of fifty-five. I was trying my best not to skip around in the book, especially because there wasn’t likely to be any answers found at the back of it, but I was already itching with questions I didn’t think would be answered. If it was Arthur, then what kind of person would he be after forty years in this place, most of it spent with him as an ultra-powerful king?

I wished that Amaryllis were sitting with me, not just so that we wouldn’t have to go on this dangerous quest to save her, not just because she was pretty, but because I thought she would indulge me in a conversation. I hadn’t asked her about Uther when we were together, and I regretted that now, but I hadn’t thought that he was Arthur, and it was all ancient history, as far away in time as Martin Luther nailing up his 95 Theses.

Fenn sauntered over while I took another break from the book, dwarf in tow. He was about four feet tall, but with a wide frame and what looked like plenty of muscle beneath his fur cloak. He had an axe by his side, which was decorated with swirls that it took me a moment to recognize as hair. His thick beard had braids that were dyed grey, his nose was crooked, and his eyes were wary, moving around to take in the tavern.

I’ll give you a brief primer on Aerb’s dwarves, but you’re probably fine if you just think of them as bog-standard fantasy dwarves. They were the second most populous species on Aerb, after humans, with there being about a billion of them in total, though you wouldn’t have known it to look at a map or take a walk through most major cities. The dwarves were a combination of farmers and miners, thanks to a doughy fungus they spread on their walls which ate away at the rock and turned it into something that was, at least for the dwarves, enough to sustain them. Being able to convert rock to food meant that they never needed to return to the surface, so many of them didn’t; there were about a thousand dwarven city-states of varying size, some of them without any entrance short of that provided by teleportation, and some warded against even that.

Oh, and one other thing about dwarves; they didn’t have women, just men. Supposedly there was a time when dwarves carved their next of kin out of stone, but a grand racial curse was bestowed upon them that forced them to become a biologically reproducing race, which they could either do with each other, or by themselves. They weren’t actually all men, because that would imply that dwarves had a gender distinction, but they did have male secondary sex characteristics, and I’ll refer to them as ‘he’ and ‘him’ from here on out.

(Incidentally, I remembered making dwarves like that. It had come from a time after Tiff had joined our group, when her own interest in the role of sex and gender in society had led me down some interesting paths in worldbuilding. The dwarves-who-sculpt-their-children and dwarves-who-have-one-gender actually came from two different campaigns, but on Aerb they were just merged together.)

“Juniper, while you have had your nose buried in a book, I have acquired a friend,” said Fenn. I looked at the dwarf, who didn’t seem like a friend. “His name is Grak, and he’s going to help us with our heist.”

The tavern had gotten noisier as it had slipped toward evening, as the tables began filling up, but it still made me wince to hear her use my real name. I also hadn’t been informed that we were even doing a heist, unless this was part of some con on this dwarf. I wasn’t entirely clear on the relationship between dwarves and elves, but didn’t figure that it would matter to Fenn much either way, not unless the dwarves were total dicks to one another.
“The name is Grakuil Leadbraids,” Grak corrected. He sniffed, flaring his wide nostrils as he looked at me. “Your companion has already given the terms.”

“The terms,” I nodded. “Fenn … good work.”

Fenn gave me a short bow. “You are most welcome.” She stretched out. “The hour has grown late and we have other business, but we’ll meet here again early tomorrow morning,” she said to Grak. “There are preparations we’ll need to make in the meantime, over the course of the next few days. We can discuss specifics tomorrow.”

Grak nodded to both of us, then walked away.

“Care to keep me in the loop?” I asked Fenn.

“Turns out that Aumann has some enemies,” she said. “I’ll tell you more while we eat over room service.”

Fenn frowned when I ordered the same pseudo-burger I’d had before. “Where’s your sense of adventure?” she asked. “When we rescue Amaryllis and she reclaims her place on the throne of Anglecyan, she’s going to take you to all sorts of fancy society dinners where you’ll be expected to eat all manner of things. Better to expand your horizons now.”

I frowned at that. “My horizons are plenty expanded,” I said. “But fine, I’ll get the … elk strips. Are there domesticated elk?”

“Why would you need to domesticate them?” asked Fenn.

“Nevermind,” I replied. “So tell me about this dwarf.”

“Just a moment, I need to call the order in,” she said. She hopped off the bed where we were sitting together and made for the phone, which had a rotary dial and hung on the wall. The mixing of technology into Aerb still tripped me up sometimes, because it was hard for my brain to switch from ‘I am talking to an actual dwarf now, dwarves are a thing here’ to thinking about things like power lines, elevators, and radio. I wondered whether it was any different in Uther’s day, whether it would have felt like high fantasy to Arthur back then.

“Alright,” said Fenn once she was off the phone. “Our dwarven friend -- is he a companion, by the way?”

I closed my eyes for three seconds and navigated the menus, trying not to pay attention to the words that showed up when I passed by the Afflictions screen. I wasn’t feeling well, but I thought most of that was still just weakness from the blood loss. At any rate, the Companions screen still just showed Fenn and Amaryllis, both with the same descriptions they’d had before.

“Nope,” I said. “Still the same.”

“Well, shit,” said Fenn. “I’d been hoping. Our dwarven friend-but-not-companion Grak is on a mission from his homeland to steal a bunch of gold, and he can’t return until he does.”

I frowned at that. “You said that he was Aumann’s enemy,” I said.

“Do you want the long version or the short version?” asked Fenn. “Because the short version is that he wants to steal some gold.”
“I’ll take the long version then,” I said. “The bartender sent him over to you?”

“Ayup,” said Fenn. “Plus two others, though they were less helpful, mostly looking to drain our coin, I think. But Grak, he was the prize. The long version is that dwarves have a complicated cultural history with gold and gold mages. To hear Grak tell it, the dwarves understood gold as a sacred metal from early in their cultural history, something to be revered and respected. Then one day, hundreds if not thousands of years ago, they found out that the other mortal species on the surface liked gold too, and the dwarves were tempted into parting with their gold for creature comforts in those pits they like to live in. It was only later that the dwarves discovered the curse laid upon the gold, which they felt some responsibility for, and which has impacted them through a series of endless wars.”

“Hrm,” I said. “I was under the impression that dwarves had city-states, not an actual nation? Does it make sense to say ‘the dwarves’?”

“It’s complicated,” said Fenn. “Dwarves feel a racial unity more than other races, I guess. They’re not part of the Empire of Common Cause directly, they’ve got their own loose governing body which in turn deals with the empire, as a kind of buffer.” She shifted. “Really makes me wish that Amaryllis was here, because I feel like I’m going to make a hash of it.”

“So … Grak is here to reclaim some gold to prevent some curse?” I asked.

“Guess what the curse is,” said Fenn, smiling and biting her lip in a way that I found quite pretty on her.

“When you put it like that,” I said, “The answer has to be gold mages.”

“Got it in one,” said Fenn. “Grak, and apparently some of the other dwarves, enough that he was given funding, believe that it was dwarves who caused gold mages to come about by releasing their stockpiles of gold into the world.”

I frowned at that. “I’m not actually sure how that’s a curse, in the conventional sense of the word.”

“I think they mean the call of the gold,” said Fenn. “Gold mages are powerful, but they’re mightily constricted in what they can do with that power, because if they don’t devote themselves to the call of the gold, they’ll fall behind. It’s not just adding a pound of gold to the vault every month, it’s adding a pound the first month, then two pounds the second month, then four pounds the third month, and so on.”

“The curve can’t be that extreme,” I said. “Aumann has been a gold mage for twelve years now, if the requirements were doubling every month that would be … um, more pounds of gold than there are grains of sand in Aerb. Which is probably not the case. The exponent has to be a little more gentle than that.”

“Whatever,” said Fenn, waving her hand. “You get what I’m saying. Anyway, the gold mages start really feeling the pressure after a while, so historically, at least to hear Grak tell it, they had two main options, one of which was to go steal some gold from someone else, and the other of which was to start up or capture a gold mine. And given that dwarves had already been mining gold since time immemorial, an enterprising gold mage could kill two birds with one stone and go after one of the dwarfholds. Steal all the gold, then enslave the dwarves and make them dig up more gold for you.”

“Okay … so the dwarves think that gold magic is their fault,” I said. “They sold the other mortal species gold and were punished by the existence of gold mages.” I had no idea how plausible that
actually was, but it didn’t seem, prima facie, to be very plausible.

“Well, it’s not actually all dwarves, anymore than you would say all humans,” said Fenn. “Grak’s clan was hit especially hard by a gold mage a few centuries back, until the gold veins were stripped clean. Anyway, that’s his mission, and why he’s willing to work with us.”

“Oh,” I said slowly. “And what does he bring to the table?”

“You’ll like this,” said Fenn, with a twinkle in her eyes. “He’s a ward breaker.”

“Huh,” I said. “I’d guess because gold mages and warders go together, so if you had a quest to take back the gold, you’d take an interest in breaking wards. That works for me … but you kept telling me that our goal was to get Amaryllis back, not to kill or disable Aumann. That changes, with Grak in play?”

“Er,” said Fenn. “I may have indicated to Grak that I knew where Aumann’s cache of gold was, and I might have said that I had concrete information that it was in the same location where Amaryllis is being held. Which, mind, isn’t a terribly bad guess.”

“We know where Amaryllis is being held?” I asked. My heart started beating a little quicker; Schrödinger's Princess had been weighing on me, even if it was reasonable to assume that she was imprisoned but mostly fine. “We know that she’s alive?”

“Oh, right,” said Fenn. “Buried the lede there, did I? She’s a floor below the penthouse, behind some heavy wards, unhurt but unhappy, at least as far as the servants know. Aumann and his inner circle are the only ones who know her true identity, but he’s not made a secret of the fact that he’s got a guest.”

“So the plan is to use Grak to get up to the top floors of Trifles Tower, use him to break the wards on Amaryllis, and then bust out?” I asked. “And hope that he’s not really pissed off at us when he realizes that the gold isn’t actually there? Did you tell him about Amaryllis?”

“Not as such,” said Fenn. “But he knows that we’re not just after the gold, and the gold might be there after all, so it’s not like we’re hornswoggling him. Not much, anyway.”

“And if the gold isn’t there?” I asked.

“Are you going to be a moral crusader about this?” asked Fenn. “Because it was, oh, earlier this morning that you were beating up a guy for information and I was stealing his stuff.”

“He deserved it,” I said. “I’d really rather not trick people into becoming our allies.”

“Okay,” said Fenn. “Then tomorrow morning I’ll go to the Impish Inn and say to him, ‘sorry, but you have no actual incentive to help us’, shall I?”

I could feel myself getting angry. As little as a few months ago, I probably would have responded to her with righteous fury, telling her that yes, she should go tell him the truth, even if it cost us. It wasn’t even that I was particularly inclined toward being a staunchly moral person, it would have just been that we were on opposite sides. So I took a step back and tried to think things through.

Yes, it was a decent guess that Aumann would keep all his valuables, people and gold alike, in one location, because there was a limit to the number of secure locations you could realistically hold at any given time, especially if you constantly needed money to pour into your ultimate source of power. The personal repercussions for us were unlikely to be all that bad, since warding magic had very little in the way of offense and it wasn’t like we would suffer from a reputation hit. The biggest
issue was that it was a crappy thing to do.

“You’re right,” I said with a sigh. “I’d rather we not do it this way, but if a resource is going to fall into our lap like this, then our actual objective is important enough that I’ll bend a little bit.” *It’s what Amaryllis would do.*

**Loyalty Increased: Fenn lvl 9!**

“Oh,” said Fenn.

“I mean, we can fight about it if you want to,” I said. “It certainly *seemed* like you wanted to fight. But I’ve been trying my best not to get into arguments with people just because I found a solidly fortified position to fight from.”

“Huh,” said Fenn. “Is that a human thing, wanting a fight with someone but not because there was anything all that important on the line?”

“Yup,” I said. “And you’re half human, so you tell me. Any particular *reason* that you’d be spoiling for a fight?”

Fenn frowned. “Nope, I said light and airy, so light and airy is what we’re going to do.”

“There’s part of you that’s worried about what happens if we actually get her back,” I said.

“And what makes you think that, little hooman?” asked Fenn.

“First off, I’m bigger than you,” I said. “Second, when we were ordering food you were snotty about it, talking about how ‘I’ not ‘we’ would have to go to society dinners. You told me before that you were worried about Amaryllis edging you out, it’s reasonable that you would still be worried about it now, maybe even moreso given that she’s got leverage over both of us with her heirlooms. You don’t want to be left behind.” *And you were basically cast out by both sides of your family, which is why you always had more acquaintances than friends. Now that you consider me an actual friend to you, you’re worried about losing me, because you aren’t going to be able to just brush me off by pretending that you never actually cared.* But those were guesses on my part, and I didn’t know how to say them so that they would come out positive and empathic rather than cuttingly clinical.

Fenn winced. “Okay, a little bit I’m worried, I guess. But pretend that I didn’t just say that.”

I looked her in the eyes. “Fenn, you’re my companion. It’s written on my character sheet. If there are fancy society dinners that either circumstance or Amaryllis forces me to go to, you’ll be coming with, dressed to the nines.”

“To the nines?” asked Fenn.

“It’s … actually I don’t know,” I replied. “And anyway, you still owe me a favor, remember?” I smiled at her. “Couldn’t let you off the hook without getting my value from that one, could I?”

Fenn opened her mouth to say something, but there was a knock on the door, and by the time she’d brought the tray of food back in, she had either gotten distracted or decided against continuing that line of conversation.

“So,” she said as she began eating some kind of noodle dish with a wide variety of colored vegetables, “Any interesting books?”

“Kind of,” I said. “Books on magic should be useful. I’m hoping that the clonal kit and The
Commoner’s Guide to Gem Magic together will be enough to let me figure that stuff out. I’m about a quarter of the way through a biography of Uther, which … is less helpful than I had thought it would be, at least as far as forming a hypothesis. The others are mostly books that I can use for reference, or that I hope will let me get a better picture of the world.”

Fenn picked up The Prince and the Handmaid from the pile. “And this one?” she asked.

“A gift, for being a good customer,” I said. “You can read it if you’d like, I doubt I’ll have the time for leisure, and I’m pretty sure that you’ll be sitting around waiting for me to finish up with things.”

“Speaking of which,” said Fenn, as she slipped Sable out from her pocket and stuck it on her hand. “The time will soon come for you to learn how to make a tattoo.” She began dumping things onto the bed, first the gun, then the box of inks, then the book of illustrations. “If you ask me, we should have robbed the guy blind from the get-go.”

“Easy to say in hindsight,” I replied. “Also, not something that you put forth when it was an option.”

“Bah,” said Fenn. “Let me have my retrospective victories.”

I ate a few pieces of the elk, which was similar enough to venison, cooked rare and seasoned heavily, but I didn’t have much in the way of appetite. Instead, I set my plate aside and picked up the tattoo gun. It was time to learn some spells.
Plot Relevant

**Skill Unlocked: Art!**

**Skill Increased: Art lvl 6!** (Skill capped at triple the value of primary stat CHA.)

**Skill Increased: Skin Magic lvl 10!**

**New Virtue: Shifting Skin!**

**Skill Increased: Skin Magic lvl 12!** (Skill capped at triple the value of primary stat KNO.)

**Icy Devil:** Wreaths your hand in ice, imbuing it with the ability to chill anything you touch for the next three minutes. Single use. Self only. Required size is roughly 1 square foot.

**Liar's Cup:** Allows you to drain minor toxins from your body, such as boscleaf, alcohol, caffeine, terrablend, nicotine, or granchar, and stealthily deliver them by touch. Infinite use. Self only. Required size is roughly 2 square feet.

**Lecher's Vine:** Produces a small, thin vine that can surround any standing entrance such as a door or window for a period of twenty-four hours. You will be alerted any time something passes through the ring of vines. Single use. Self only. Required size is roughly half a square foot.

**Surface Sheath:** An object pressed against the tattoo will skin into and become part of the magic of the skin, allowing it to be retrieved later by pulling at the edge of the tattoo. Object must be inserted within thirty minutes of tattoo completion. Required size depends upon the size of the object to be stored.

**Snake:** A non-poisonous snake comes to life and slides from your skin. It has normal intelligence for a snake and holds no particular affection for you. Single use. Self only. Tattoo size determines size of the resulting snake. Taking care of a snake is a big responsibility!

There was a hidden cap to tattoo magic, which was that it seemed to depend on my Art skill, something I hadn't known existed until I'd tried to draw something with the tattoo gun. I wasn't using my own skin, and instead spent some time mucking about with the clonal kit until it gave me a piece of fresh skin to work with (profession, "tanner"). The tattoos themselves were very tightly specified in terms of angles, arcs, inks, and relative size of individual pieces. It called to mind an assignment we'd had in art class to make a vector logo; logos needed to be scalable and consistent, so each part of them had to be defined in mathematical terms, allowing infinite, varied reproduction. A tattoo mage wasn't just drawing a devil on the skin that came to life and gripped his hand, he was drawing a very specific devil.

And as it turned out, I just didn't have the skill with a tattoo gun to complete all but the five most simple tattoos, of about thirty in the half book that Fenn had grabbed. Still, a few hours of practicing had allowed me to put a number of tattoos onto my skin, and the new virtue I'd gotten made moving them across my skin to other areas as easy as directing a thought at them, which meant that I could do all my tattooing on the relatively large expanse of skin on my thigh, moving the tattoos elsewhere when I was finished.

All thing considered, it was more or less a bust, which was why I moved on to gem magic.

According to *The Commoner’s Guide to Gem Magic*, gem magic didn’t have analogies at all.
Instead, gem magic had three different axes of effect, and each gem could be assigned a numerical value for each of those axes on the basis of its color. The book didn’t call it the RGB color model, but it kept using the words red, green, and blue.

(It goes without saying that this made no sense. I mean first of all, the entire reason that RGB was a valid model for color at all was that human eyes only had three color-sensing cells that responded to those wavelengths. It would be entirely possible to make an organism that had different spikes at different wavelengths, or one that had another color-sensing cell. There were creatures on Earth that had four color-sensing cells, and it probably went without saying that with 200 mortal species on Aerb there were some that didn’t sense colors like humans did, a fact specifically mentioned by one of the appendices of the book. But apparently, gem magic was implemented in the world in accordance with human color definitions.)

All of the colors were offensive, all projecting force onto the world, with variance in terms of number of projectiles, spread, speed, refresh, and what seemed like a dozen other things. It wasn’t until the book laid it out in an example that I really got it (though that did make me feel like a commoner).

- A pure red gem will fire a constant projection of force, half of which will be directed back at the user. This beam will have 0 spread.
- A pure blue gem will fire once every eight seconds, emitting fifty projectiles at a spread of 180 degrees, which will alter course toward user-intuited targets up to 90 degrees.
- A pure magenta gem will fire once every four seconds, emitting twenty-five projectiles at a spread of 90 degrees, which will alter course toward user-intuited targets up to 45 degrees. One-quarter of projectile force will be directed back at the user.

**Skill unlocked: Gem Magic!**

**Achievement Unlocked: By Your Powers Combined**

I was a little bit annoyed when thinking about light going through the gems allowed me to gain access to the magic within them, because that was the second thing I had tried. Sure, I understood more about gem magic now than I had then, including some knowledge about what effect the crude gems made by the clonal kit would actually do, but I’d already gotten the analogy down, hadn’t I? The gems had to be about light, if the output was light and the underpinning was RGB values. Maybe the analogy didn’t matter, in this case, and it was the knowledge that counted, but it really did seem like the sort of thing that I should have been able to get on my own.

I got another little bar, which popped up right beside the bar measuring blood. This one was a cerulean blue and throbbed with a faint light. A quick look showed its label as “Mental Exhaustion”. It had a value of 9/12, which was equal to three times any of my mental stats aside from MEN itself. If I could knock over four end tables before draining myself of mental energy, ho boy, look out world, here I come. (Yes, I was disappointed in the ability to shoot magic lasers out of my hands, because I had become spoiled.)

The hotel room wasn’t actually a great place to practice gem magic, which I learned with the first blast of red light, which knocked over the end table. Fenn had applauded that, but she was making her way through *The Prince and the Handmaid*, and returned to her book after it was clear that I wasn’t going to start knocking other things over.

I set up a target area with a few pillows from our bed and a thick-skinned citrus fruit we’d gotten with dinner, then started using the red gem to knock it over. The gem wasn’t quite pure, and it became clear to me that it was really, really important for gems to be, if not of a pure color, then at least with a favorable combination of effects. It reminded me a lot of finding a randomly generated
gun in Borderlands and hoping that it was more than the sum of its parts.

And it wasn’t just that I had to worry about color, because there were so many aspects to the gems which altered their behaviors in different ways, ways which depended on each other. A larger gem had more power than a smaller gem, but a lack of clarity increased the mental exhaustion of using a gem in relation to its size. Facets could have different types and levels of symmetry, which changed the metrics involved, some flatly negative, a few flatly positive, and most with some tradeoffs involved.

And all that was fucking useless because the clonal kit refused to provide me with any more than the eight gems it had provided for me the first time I’d tried, no matter how many permutations I tried on the basic premise. From what the book had said, gem mages all carried unique loadouts, so maybe the clonal kit was confused by trying to create what “a gem mage” would carry, which was why it kept creating the same thing.

I fired off a few blasts of red at the fruit, going over to set it back up each time. I was relieved to see that the gem wasn’t actually costing me three mental exhaustion each time, but that meant that mental exhaustion in the game sense was a numerical representation of my actual mental exhaustion, and that was what gem magic was draining. I wasn’t sure how I felt about that, especially because I was pretty sure that I would need my mental acuity tomorrow, and as was typical, the game wasn’t giving me any hints on how quickly I would recover from mental exhaustion.

Firing off enough red blasts to get Gem Magic up to level 5 took me down to 6/12, which was low enough that I decided to stop there. I tried all eight of the gems, which had their different (but more similar than unique) effects. It was only black and clear that I couldn’t get to work; going on the basis of RGB, white would be all values set to 255 and black would be all values set to 0, but apparently those two were “special”, and beyond my ability; the black one was countermagic for gems, capable of negating an assault to within limits defined by the gem’s characteristics. Diamond had no offensive capabilities at all, and was instead used to boost gem magic, though The Commoner’s Guide to Gem Magic was silent on exactly how that was supposed to work, given that you could only use one gem at a time. Working in pairs, maybe?

It would suffice to say that gem magic was also kind of a bust. I was glad to have it, rather than not have it, but it seemed like a pistol would clearly outmatch it, at least given the gems and ability I had. And worse, the gems were quite expensive, probably beyond our ability to pay with the clonal kit’s high prices, which meant that if I was going to have them on hand, I was going to have to forgo the use of the clonal kit.

“You didn’t eat all your elk,” said Fenn, when she noticed me staring at the gems in my hand.

“Yeah, not that hungry,” I said. I’d had one of the three thick strips, then set it down.

“You had some street food during your sojourn to the bookstore?” asked Fenn.

“No,” I replied.

“Well, you’ve got to eat,” said Fenn. “Especially if you’re sick. You fucked up your bones and you’re low on blood, elk is good for you, it’s got iron.”

“Yeah,” I said. I’d lost fifteen pounds after Arthur had died, but then the lack of appetite was caused by depression, not whatever was going on with my guts as a result of not having a magically functional rib cage, or whatever it was. I’d had similar talks, about how I had to eat, from my mom, my dad, and Tiff. Eventually I was just shoveling food into my mouth, trying to ignore the fact that it didn’t really have a taste. So I decided that Fenn was probably right, and cut up four room
temperature pieces of elk, chewing them quickly and swallowing them down.

“You okay?” asked Fenn.

“Sooner is probably better than later, when it comes to the rescue plan,” I said. I rubbed my hand. It did feel a bit weaker than before, but it was hard to tell, because it was my left hand, and I’d only had a short time of experiencing ambidexterity.

“Grak is ready to jump the gun too,” said Fenn. “He’s been in town a month trying to crack this thing. I’ve given him some hints as to our resources, which has made him quite eager.” She watched me eating the cold elk. “I can get different food for you, if you’d like,” she said.

“No, it’s fine,” I replied. I glanced at the book she’d been reading. “Anything good in there? Or … plot relevant?”

“Bad guy wins,” Fenn replied with a shrug. She paused. “Plot relevant in the sense of?”

“In the sense of … I don’t know, was there a clue? Or something like that?” I asked.

“How did you get this book?” asked Fenn with a raised eyebrow.

“The shopkeep was reading it when I came to the store,” I said. “When I left, he said something about me needing leisure reading too, and then added it to the pile, free of charge.”

“And you think that it has some … relevance?” asked Fenn. “You think that the shopkeeper was reading that specific book because the universe meant for you to have it, because it has a cosmic connection to some unspecified thing?”

“It might,” I said. “I mean, it’s not out of the question. That’s the kind of thing that elf luck would do, isn’t it?”

“Not really,” said Fenn. “It’s more a feeling of going with the flow, moving along a certain path, weal and woe kind of thing. Not random guys giving you books that turn out to have hints. You’re saying that’s how games work?”

“It’s how narratives work,” I replied. “Anton Chekhov was this playwright in the 1800’s who posited that, basically, every element in a play needs to be there for a reason. If you have a gun placed on the mantle in the first act, it has to be fired by the end of the third act, because otherwise you screwed up by putting a gun there in the first place. Ernest Hemingway was the same way, I think.” I flexed the fingers in my left hand, which didn’t feel quite right, and which flexing didn’t quite fix.

“Games are different though, because you can’t guarantee that the setups are going to have payoffs unless you take away all elements of player choice, or plan multiple payoffs for each setup. I mean, in a tabletop game, you place a gun on the mantle at the start of the session and then maybe the action moves somewhere else without the GM being able to do anything about it. My own personal strategy was to just lay down as many details as possible and then wrap them back in whenever I could.”

Fenn sat patiently through all that. “You really like your games, don’t you?” she asked. “We should play sometime.”

“Seriously?” I asked. “I mean yeah, I would probably like that, if we ever got a decent stretch of time where we weren’t running out of food or money, or where people weren’t trying to kill or torture us, or … you know, the kind of garbage we’ve been dealing with.” And then I can get sent from Aerb to
a different fantasy world I made for the game-within-a-game. Yay! “But what I’m trying to get to, at least a little, is that some amount of game logic might apply, because of my own particular brand of something like luck, so if The Prince and the Handmaid is a clue, what kind of clue is it?”

Fenn picked up the book and flipped through the pages until she reached the very end. “What’s your last name?” she asked.

“Do you honestly not know it?” I asked. “I can’t tell whether you’re joking or not.”

“Alright,” said Fenn. “You tell me your last name, and I’ll tell you whether or not I was joking.”

“Fenn, we’ve been together for almost three weeks now, how is it possible that you don’t know my last name?” I asked.

“It never came up!” said Fenn. “Do you know my last name?”

“Greenglass,” I replied almost immediately.

“You’re a filthy cheater, that’s written on your eyes,” replied Fenn, nearly as quickly. She laughed at that. “But seriously, what is it?”

“Smith,” I said.

Fenn nodded, then sat next to me and pointed out a line in the book.

The wedding took place in the gardens of Castel Chernwith, one of the old holdings of Uther Penndraig with plants yet living that were planted by his firm hand. The largest of these was a juniper tree, which had grown to shade a large bronze statue of the great smith Merschen Edel. It was here that Uther was said to come from time to time, and so in the same shade his magnificent ancestor had stood under, steeped in the ancient history of Anglecynn and promising himself and his bride to its legacy, did the Prince and his Handmaid finally marry, sealing their vows with a kiss.

“Like I said, bad guy wins, the prince is a total dick that poisons the guy the handmaid is in love with, and she’s a bit of a cunt because as soon as that guy gets weak from the poison she loses interest and goes back to the prince.” Fenn pointed to the line again. “But there, juniper and smith, seems like the kind of thing that might be a clue.”

“It’s proof,” I said slowly. “Proof that he knew me.”

“Uther Penndraig knew you?” asked Fenn. I could hear the skepticism in her voice, but she wasn’t being dismissive, like I thought she would be, like she normally was when the topic of Earth came up.

I hadn’t told her about Arthur. I hadn’t said his name out loud yet, not since I’d arrived here. I didn’t like saying his name, because it brought a lump to my throat and tears to my eyes. And maybe there was a part of me that thought it was sacred, and that any hope I’d had about him still being alive somewhere in this fantasy world would be washed away as soon as I admitted he had ever existed at all. But that was all stupid stuff my brain was doing that didn’t make sense, I could see that, and now it was at the point where it needed to be said, because I was going to need help, if I was going to find the Lost King.

So I told her about Arthur.
Fenn was a good listener. I mean, she wasn’t a good listener in general, she was actually kind of terrible at it, even setting aside that some of that was an act or her sense of humor, but while I was telling her about Arthur, she sat beside me and listened to what I said, nodding along when I needed encouragement and then slipping her hand into mine when my voice went hollow.

“I’m sorry,” said Fenn.

“Yeah,” I replied. I was silent for a bit. “Anyway, that was him. Uther was his character, the Best King Ever. I have a quest to find the Lost King. And he … he planted a juniper tree beside a statue of a smith, and that was where he went when he wanted to think about me. I know that’s all just my version of things, that it might just be the dream-skewer talking --”

“No,” said Fenn. “I believe you.”

“You do?” I asked. “All of it?”

Fenn had been holding my hand, but now she unlaced our fingers. “All is a strong word,” she said. “I think there’s a place called Earth, and your soul, with all its experiences, is from there. Maybe that’s what the dream that skewers is, one personality writing itself over the other like a palimpsest.” She hesitated. “But there are so many things that you say are from your games, or taken from your world in some way, and … I don’t see how that makes sense, because it would mean that this entire world is about you and only you. That would mean that not only am I your actual, factual companion, I only exist to be your companion.” She clenched a fist. “Sorry, really don’t want to be talking about existential stuff right now, but … it’s kind of doing my head in.”

“It’s okay,” I said. “The whole thing has been kind of a head trip for me too.”

“Yeah,” said Fenn, “I guess so.” She looked down at the copy of *The Prince and the Handmaid*, which was sitting on the floor. “So that was the book’s purpose? To spur on this conversation? Or … to give you some concrete detail about Uther?”

“I’ll need to follow up on it,” I said. “Maybe it’s just me trying to connect the dots.”

“Well, fuck,” said Fenn. “It’s not like I was planning on doing anything better with the rest of my life. When we find the Lost King, he better have some well-oiled, muscular men waiting for me.”
Grakhuil Leadbraids was at the Impish Inn before us, and when we arrived he led us into a back room with a nod to the barkeep and a grimace at the caged imp that served as the tavern mascot.

“I sold my profession for this room,” said Grak with a sniff as he sat down in one of three chairs arranged around a table. I noticed, but didn’t comment on, the booster seat that gave him an extra few inches. There wasn’t much room to move inside the room, but it was enough for us. Grak had papers spread out on the table, most of them with drawings on them. “We should be safe here, as safe as a warder can make any place on short notice. No sound will leave these walls.”

I had stayed up late reading The Commoner’s Guide to Warding Magic, enough to get some sense of the boundaries a warder had to work with. There were lots of different types of magic in Aerb, and since warding was counter-magic at its heart, warding against “latent magic” meant that wards could extend into other areas that didn’t seem, on the face of it, to be magical. There were velocity mages, water mages, wind mages, vibrational mages, steel mages, flower mages, revision mages, the list ran on and on, and on top of that, there were individual “spells” that were independent of any school, plus magic inherent to exclusion zones, plus magic only available to monsters, plus unique magics inherent in magic items. The block against sound was, I figured, some kind of barrier against latent vibrational magic.

“I have seen as much of Trifles Tower as I could from the outside,” said Grak. Warders had warder monocles, which let them physically see the wards. “Sheriot placed strong wards on all entrances. There is a way for servants to get in which has weaker, sloppy wards I have already probed and can easily subvert. We are going to use the servants’ entrance without breaking the wards there. I will deal with any wards as we go up the tower. The two of you will kill anyone who gets in our way.”

Fenn cast me a look at the word kill. I’m sure the words ‘moral crusader’ were going through her head, but I wasn’t about to say anything that would get Grak in a huff. We needed him, and if he asked us to do something utterly immoral, like murder a maid who saw us, we could just refuse. Guards were a more morally grey issue; they wouldn’t even necessarily know that Aumann had Amaryllis, they might just be men doing their jobs … and I was pretty sure that I would hesitate before striking them down, but I would strike them down, non-lethally if at all possible. Even as the thought crossed my mind, ‘non-lethally’ seemed like a pipe dream.

“What about Aumann?” asked Fenn.

“We will wait until he’s away,” said Grak. “He always travels with his revision mage to cover for gaps in his gold magic. His warder will not be a problem if she is there.”

“And the others?” asked Fenn. “Word on the street is that he’s got a few other heavy hitters under his employ, still mage and velocity mage among them. The velocity mage, if he exists, would be quick to respond if they know we’re there. And I have to say I don’t like the idea that we’re just waiting for Aumann to leave.”

“Echert is his still mage,” said Grak. “He spends his days at the cheese factory. Lida is his velocity mage. She never goes inside Trifles Tower because of the existing wards against velocity there.”

Fenn grumbled in acknowledgement of Grak’s superior intelligence gathering.

“We should still get Aumann away ourselves,” I said. “I think we have the resources to set up a diversion for him, something that will pull him from the tower for a set amount of time. Gold mages
love gold, right?"

Grak raised a thick eyebrow. “You have gold?” he asked. He looked to Fenn. “You have gold?”

Fenn sighed, making it sound more like a hiss of pain. “We’ve got three pounds,” she said. “For emergencies only.”

Grak ground his big, flat teeth, tensing. “He will sense it,” he finally said. “He will be drawn to it, if it’s close enough, long enough. Forced to it. Where is the gold now?”

Fenn dipped her hand down her shirt and pulled up the black glove, which she laid on the table. “There, for me to call out as needed. This is the item I told you about.”

Grak relaxed marginally, from high alert to just looking like he had a stick up his butt. “Can I test it?” he asked.

I wanted to give him a flat no, because Sable was not just a very useful magic item but contained the bulk of our current party loot, but Fenn tossed the glove over to him. Grak pulled a wand from beneath his furs and drew a single line across the table, then waved the glove back and forth across it.

(The wand was of a very elaborate make, and a staple of the warders; from what I had gathered, it was equivalent to a Jedi building their own lightsaber, except that warders were functionally useless without theirs, at least until they engaged in a complicated, months-long process to build a new one that was uniquely keyed to their soul. The other bit of warder kit was a monocle, which was a similarly involved process to build and let the warder see wards.)

When Grak was finished, he tapped the place in the table where he’d drawn the line, then tossed Sable back to Fenn, who slipped it on. “And?” she asked.

“The glove blocks the gold,” said Grak. *Meaning that line was a weak ward against latent gold magic. Neat. “You’re right. We can set a trap to lure Aumann.”*

“That’s like sixty thousand obols worth of gold that we’re basically giving away to the enemy,” said Fenn. “Am I the only one that has a problem with that?”

“We’re dead if this plan fails,” I said. Grak nodded. “No,” replied Fenn. “You’re not thinking about failure the right way, there are lots of ways that the plan could end without us so much as having exposed ourselves. *If* we were to set up a distraction using our literally sixty thousand obols worth of gold, then we’re fully committed before we even get through the doors, which means that we can’t back out, not without blowing our funds.”

“You’re right,” I said with a frown. I looked to Grak. “It’s something about the call of the gold that will tell him where the gold is, right?” I asked. “Can you block that?”

Grak looked between the two of us and sniffed, then tugged on one of the braids of his beard. “You want to collapse the ward at a distance,” he said. “Clever.”

*Loyalty Increased: Grak lvl -1!*

I blinked at that. I needed a discreet way to close my eyes for a few seconds and check my character sheet. If Grak was a companion now -- wait, if Grak had *negative loyalty*, then -- I wasn’t actually sure what negative loyalty meant, but it didn’t seem like it was good. In the end, I decided that Fenn would just cover for me.
“Is he well?” asked Grak.

“He’s thinking,” replied Fenn. “He trained with the Elon Gar, but only for a fortnight before he was kicked out. The only real trick he learned was to think a little bit better by shutting out the world for a moment. No doubt when he opens his eyes back up, he’ll have something clever for us.”

Grakhuil Leadbraids was, indeed, listed under “Companions”, with a greyed out box where his biography should have been, and a -1 for loyalty. That was the first time that the game had given me a negative number, so hooray for firsts, except that Grak was **actively** disloyal to us, if I was reading the negative right. (Or he was **so** loyal that it had caused an integer overflow, but that didn’t seem likely.)

“We have three pounds,” I said. “We can set up three different locations around the city to distract Aumann with. Depending on how much he’s drawn to the gold, how well he can sense it, we should do some work beforehand, pulling gold in and out of the glove for brief periods of time and then moving on so that he gets used to the idea.” I turned to Fenn. “Have we pulled the gold out yet since … our arrival?”

“No,” said Fenn, rubbing her chin. “I’d imagine that there was a ward against gold in the place we picked it up then, to hide it from his senses?”

“You stole this gold,” said Grak with a nod. “Most would hide it so, if they had the resources.”

Neither Fenn or I particularly wanted to discuss our time at Caer Laga with the dwarf, for obvious reasons. I decided that I was going to pick up warding as soon as I had a month to devote to making the relevant equipment, because tripping over mostly invisible wards or dealing with ones that I had never seen before was not my idea of a good time. Of course, if Grak was a companion, then the rules I set down as DM long ago meant that he would have to have some way of actually having his character work with the party, instead of being doomed to a role as adversary.

“So we go around Barren Jewel, pulling gold out for long enough that he senses blood in the water, then putting it back,” said Fenn. “Then on the day of, Grak sets up wards around as many distinct piles of gold as possible, wards that will need a gold mage to break, and we send him on a scavenger hunt across the city while we climb the tower and go for the prize.”

“How much can the glove carry?” asked Grak.

“It has no known upper limit,” said Fenn with a satisfied smile.

“We’ll put all of the gold into it,” said Grak. “He will either degenerate or lose power completely. We can leave without ever having seen him.”

“He’ll know,” said Fenn. “First bar that leaves his vault, he’ll know, and that’s assuming his warder doesn’t trip you up and get the message that we’re in there, taking his stuff.”

“We could leave out a window,” I replied. “I know travel by glove is no one’s favorite, but … it’s doable. We could just flutter down to the ground and pop back out, no need for gas masks.”

“We don’t know who is going to be in the tower,” said Fenn, “Even if the big guy himself is out in the world, away from us, and his most powerful minions are gone, we don’t know what we’re going to find.”

“What do you suggest?” asked Grak.

“More time,” said Fenn. “Time to talk to people, time to get some intel, maybe, I don’t know, go to
city hall and get some old permits that show the floor plans or something.”

“This is Barren Jewel,” said Grak. “Such things are not done here.”

Fenn deflated somewhat. “Why are people always suggesting that I come up with alternate plans?” she asked. “Doesn’t seem fair to me. I mean, I would suggest that we apply for jobs at Trifles Tower, but Aumann has already seen our faces, which means that we’d be banking on him either not recognizing us or just not showing up to vet a low level position, and odds are that wouldn’t even get us into the upper levels.” She looked at Grak. “And I doubt that he would allow a dwarf in his employ at all.”

Grak nodded. “Where exactly is the vault?”

“We lied,” I said.

“Joon, for the love of --” Fenn began.

“He’s flagged as companion,” I replied.

“You lied,” said Grak, prompting me to go on.

“Aumann is holding our friend, Princess Amaryllis Penndraig of Anglecynn, hostage,” I said. “He’s going to use his resources and her information to collect more money and more gold. We know where she is and we assume that his stash of gold will be near where she’s kept, and besides that, the top of his tower is the most likely place.” I was banking a lot on the fact that dwarves valued being forthright. “We need your help because we can’t do this without you. I think you need our help too, if you’ve been here for a month.”

Grak grumbled at that, thinking, while Fenn looked daggers at me. But it wasn’t exactly like I could duck out of our conversation with him in order to talk about whether or not we should bring him in, not just because it would be awkward but because having a private conversation would undermine the trust I was placing in him. What I really wanted, more than anything, was to get his loyalty up.

Loyalty increased: Grak lvl 0!

“I was right not to trust you,” he said, which was basically the opposite of what the game was saying. I kept waiting for a ‘but’, and it never came, because that was apparently all Grak had to say, except …

“Yet you’re still sitting at this table,” said Fenn.

“Your quest was to bring gold back?” I asked. “Was it any gold, or Aumann’s gold in particular?”

Grak shifted in his seat. “One thousand pounds is my penance to the clan,” he replied.

“Or about twenty million obols,” I said. “Alright, if you help us to rescue Amaryllis, we can provide that, if it turns out that there isn’t any gold in the upper levels of the tower. Obviously if the gold is there, you’ll break down the wards and we’ll rob him blind, but if it’s not, then Amaryllis Penndraig will have the ability to pay for your services.”

Fenn was still glaring at me, but Grak was looking a little more relaxed now. “You intended to deceive me,” he said. “We can work with each other, so long as we’re working in the same direction.”

Fenn raised an eyebrow at him. “Water over the bridge, just like that?”
Grak shifted in his seat. “It’s different, in dwarven culture,” he said. “Most of the other mortal species allow bad blood to perpetuate through retribution and mistrust.” He looked me in the eyes. “It marks us as naive to others.”

“Because it doesn’t scale well,” I said. I remembered that cultural trait; I’d given it to hobbits, not dwarves. “It works in smaller settings, where it’s important that you not have constant feuds and escalations, but in a city of a million people, you run into too many people that you can only ever expect to see once. The counterpoint to forgiving first offenses is that you judge second offenses harshly, but in the city that’s just not an option, because there’s no second offense for you to levy against.”

“Are you a student of dwarven culture?” asked Grak.

“No,” I replied. “Just a student of cultures generally.”

Loyalty increased: Grak lvl 1!

And I would like to be a student of dwarf culture, especially to understand how they resolve the inherent contradiction in a tit-for-tat-with-forgiveness strategy with sending people out to steal gold. “Dwarves have always interested me though.” I turned to Fenn. “I’m sorry I didn’t consult you first, but you have to understand how it would have looked if I had tried to have a private conversation with you before telling him the truth, right? It would have seemed like we were getting our stories straight.”

Fenn pinched the bridge of her nose. “All’s well that ends well. Are we still going ahead with the plan of hiking our way up the tower and spending our gold on distractions?”

“I’m open to better offers,” I replied. “We still have some time. We’ll want to watch Aumann to see how quickly he responds to the presence of gold in the city, do a few dry runs mapping out his movements.”

Fenn was pissed at me, as might have been expected. She didn’t bring it up when we finally left the back room at the Impish Inn, and I was content to let her stew about it while I tried to think about how the fight would go. She would call me a traitor, maybe, or say that I was naive, or … something like that, maybe, given what she’d said before. She hadn’t brought up the fact that Grak might be only pretending to work with us in order to sell us out, but I’d seen his loyalty go up twice, and that seemed proof enough against nefarious intent. His loyalty meter wouldn’t be rising while he was plotting against us, would it? (Would it?)

We moved through the city together, passing by people, shops, ugly buildings, and haphazard wires. We didn’t say anything to each other as we walked through the hotel lobby, and the only thing Fenn said in the elevator was our floor number. I sat in one of the room’s chairs while Fenn flopped out onto the bed, and I waited for her to raise her objections, which I was sure were going to be personal rather than professional. It was about the fact that I hadn’t consulted her, that was the source of her anger, this feeling of being unappreciated, certainly not the outcomes of the meeting, and only maybe some piece of ‘the ends were good but the risk was unacceptable’.

“How many companions are you going to have?” Fenn asked the ceiling.

“Uh,” I replied, because that wasn’t where I saw the conversation going at all. “Uther Penndraig had seven, so that’s not a bad guess.”

“So there are, maybe, four others left to find,” Fenn said to the ceiling. “Crap, I’m going to have to
read that biography of Uther Penndraig, aren’t I? I’m going to have to figure out how they dealt with it.”

“With what?” I asked.

“With being caught up in your wake,” said Fenn. She sat up and looked at me. “You turned on a dime, because the game said so, and that means that we turned on a dime.” She sighed. “I’ve got whiplash, that’s all.”

“You wanted him to be a companion,” I replied. “You said that, when you first introduced him to me.”

“Sure,” said Fenn. “But I thought it would be us bringing him into the fold, not … this. Not you making a unilateral decision, and yes, I understand why you made that choice, why you thought it was important not to loop me in, and I have a good enough read on Grak that I think he’s actually pretty happy, but … I feel like I’m a side character.”

“You’re … worried about your place in the narrative?” I asked.

“Does loyalty ever go down?” asked Fenn.

“I haven’t seen it happen, no,” I replied. “Generally speaking … it depends, but generally speaking most games like to satisfy the need to see numbers get bigger, so no, generally loyalty goes up and not down.”

“Do you understand why, if I accept your version of reality, that might be terrifying?” asked Fenn.

“Because it’s not how people work,” I replied. “Yeah, I get it.”

“I think I should be more angry with you than I am,” said Fenn. “We talked about what our story was going to be with Grak and then you decided, in the moment, that you were going to tell him anyway, despite us having a whole conversation about how we weren’t going to do that. I was upset by that, but I could feel that anger fade, and by the time we left the tavern I was over it.”

I stared at her. “Wait, you’re mad at me because you’re not mad at me?”

“Ugh, it sounds so dumb when you put it like that,” said Fenn. She flopped back down on the bed.

“I get it,” I replied. “You know that there are changes in how I’m thinking, right? I put points into the mental stats and now I’m left second-guessing myself about what’s me and what’s been modified by the game. When I was putting that rocket together in the desert, I was trying my hardest not to think about how I knew how to do all these things, how much was pulled in from my experiences on Earth and how much was just inserted as-needed by the game itself. I doubled my insight and now when I think things about people, there’s always this temptation for me to think, oh, that’s the game feeding me information, screwing with my head. And if it’s not, then I was fundamentally, irreversibly changed on a core level.”

“And how do you deal with it?” asked Fenn, looking at the ceiling again.

“Mostly I don’t,” I shrugged. “I push forward, try not to think about it, focus on other things, do what needs doing. I don’t think it’s a question that has an answer, so … ignore it, I guess.”

From the angle I was looking at her, I could just barely see her smile at that. “It’s brilliant,” she said. “Ignore the problems, make jokes about them … a task I was purpose-built for.” Her smile faded. “I really hope that I wasn’t purpose-built for it.”
“Yeah, me too,” I replied.

*Loyalty increased: Fenn lvl 10!*

*Companion Passive Unlocked: Twinned Souls (Fenn)!*

I resisted the urge to say “fuck” and instead closed my eyes to look through the screens to figure out what that actually did. It was listed under “Companions”, just below Fenn’s biography.

**Twinned Souls**: Fenn is a loyal companion, now formally part of your kharass, and will never lag behind you in relative power, so long as she is a member of your party.

Huh. That … was actually pretty good. I was a generalist, with a generalist’s build, but so long as I kept gaining levels (which I fully intended to do) it had seemed like I was destined to make Fenn largely irrelevant, at least in terms of combat ability, since I was already a better swordfighter than her, and the last few levels of Dodge and Parry had been difficult because there wasn’t actually that much challenge in it. That left the question of whether to tell her, which was hardly a question at all.

“You just hit loyalty level 10,” I said. “The game says you have a thing where you’ll match power with me as I level up.”

Fenn was quiet for a moment. “Neat!” she finally said. She sat up again and then closed her eyes. It took me a moment to realize what she was doing. “Aw, no stats screen for the half-elf,” she said as she opened her eyes and looked at me. “So if you’re on the path to becoming the next Uther Penndraig, then I’m on the path to becoming, what, the greatest archer the world has ever known? The most charming half-elf in the land? The word power is a bit ambiguous, tell your game that I’d like more, please.”

And with that the tension was broken, at least a little bit, which I was happy for. I had suggestions about how to gauge power, which mostly revolved around doing simple, repetitive tasks that had a chance of failure we could assign a metric to, but Fenn thought that was the most boring thing in the world. We descended into other topics from there, stories of Earth and Aerb, tales from Fenn of stalking the Risen Lands for treasure, and for the most part, we went back to normal.
We went into Trifles Tower through the service entrance two days later, with only minor deterioration to my condition, after Grak spent ten tense minutes with his wand against the wards, subverting or changing them somehow. We’d watched the outside for long enough to get a sense of what people wore; the bottom two thirds of Trifles Tower was an eclectic mix of residences, office spaces, and stores, which meant that there wasn’t much need for us to wear disguises as we made our way up the stairs. Most of the traffic in the building would be through the central elevator, meaning that we’d have the stairs to ourselves anyway, if luck was on our side. After we were in the stairwell we’d taken out the equipment it wasn’t wise to show off on the street, like the bandoliers of dead fairies and a second bandolier of bones.

When we got up to the seventh floor, Grak stopped us. “Ward,” he said. He squinted against his monocle, looking at something that was invisible to us. He crept closer and stuck out his wand, prodding at something. He grinned and sheathed his wand. “It’s nothing,” he said. “Basic detection ward against a variety of magics, intended as warning if any of the big guns come knocking. We’re the wrong kind of big guns.”

I winced at that. Grak had not been appraised of my unique situation. “Do you have specifics?” I asked. “Would it tell her about skin magic? Gem magic?”

“Are you curious or cautious?” he asked.

“I have tricks up my sleeve,” I said. I shifted one of the snake tattoos down my arm until the head poked down from my long sleeves. When Grak had seen it, I lifted my hand and lit the tip of my finger on fire with a pulse of my blood. “Nothing earthshaking.”

Grak looked me over. “This ward will alert her to high velocities consistent with either gunfire or a velocity mage,” he said. He moved his wand marginally, though neither of us could see what it was pointing at because his monocle was at his side. “It will detect against the latent magic in any gems, gold, carapaces, flowers, fires, crystals, pustules, devils, or demons, as well as the passive or active magic of a blood, bone, skin, wood, or gold mage. Which of those apply?”

I hesitated. “Is it just at the barrier here, or will it apply throughout the building?”

“Which, of those, apply?” said Grak with gritted teeth.

“We have gems in the glove,” I said. “I have a single tattoo that’s passive in nature,” which I don’t actually know how to remove, come to think of it “but I’d like to know whether we can get around that by me entering the glove, having Fenn cross through the ward, and then me exiting the glove.”

Grak sniffed, which I’d come to think of as one of his nervous tics, like he thought that he could learn more about a situation by smelling. “Should work,” he said. “The glove can make a fool of many wards. You should have told me.”

He was right, but I’d been trusting The Commoner’s Guide to Warding Magic when it had said that skin wards were used almost exclusively to prevent physical intrusion.

“You’re more well-trained than I gave you credit for,” said Grak.

“Yeah,” I replied. “Usually keeping that under wraps works to my advantage.”

“You’re more well-trained than should be possible, given your age,” said Grak, still watching me.
“We don’t have time for this conversation,” I replied. “I give you my word that after we’ve finished getting Amaryllis back, I’ll tell you everything.” I tried not to put too much stress on the word ‘my’ there; Grak liked me more than he liked Fenn, and he certainly trusted me more than her, for obvious reasons.

“Fine,” said Grak. “You heard what I said about demons and devils?”

Grak grunted, which he sometimes did by way of assent. I felt a hand on my shoulder, and saw pitch black in my peripheral vision, and started on the controlled breathing that I’d been practicing, mixed in with all of the reading and other practice, plus scoping out Trifles Towers, plus finding locations for our distractions and helping to set them up, plus the bouts of feeling sick. (I would probably have listened to Fenn about us going too fast with this plan, but I’d broken two fingers in my left hand the day before while trying to open a jar. I murdered and ate some fairies to fix them, but it was a grim reminder that I was getting less useful as the days went on.)

I spent no more than ten seconds in the void of Sable before being spat back out onto the stairs. We went a little more slowly up the stairs now, with Grak being even more cautious than he had been before. The stairway wasn’t quite an institutional fire escape, but it had some similarities, mostly in the sparsity of furnishings and bare bulbs that provided illumination. I was still well enough to not feel winded from the climb, but it was a strain nonetheless, and I could tell that Grak was feeling it. Some of his stops with his monocle out were, I was pretty sure, because he wanted to catch his breath a bit.

“Contact, site A,” said Grak when we reached the thirteenth floor.

That meant that active gold magic had passed through a ward he’d placed in a room we’d rented on the north side of the city. Once Aumann was there, it would take him an estimated fifteen to twenty minutes to use physical force to break the wards around the gold, maybe a bit more, and then he’d either be heading back to the tower or off to one of the other sites.

The problem was, the plan had been for us to spend some time waiting at the top of the stairs until he got to one of the sites; he had moved a lot faster than we’d thought he would, or maybe we had moved a lot slower. We had another seven floors to the top.

We booked it up the stairs, straining hard, Grak more than me or Fenn. We hadn’t seen anyone using the stairs yet, nor had we heard anyone using them, which meant that the stealth aspect of the plan was going fairly well, and we could use that in order to make up for the timing aspect going decidedly poorly.

We reached the top of the stairs and took a moment to catch our breath.

“Shit,” whispered Fenn. “This is the nineteenth floor. Trifles is supposed to have twenty floors, right?”

Of course we all knew that it was, because we’d been over the details, such as we had them, backward and forward. Supposedly, Aumann’s guest was being held in the top floor, next to where Aumann himself slept, but the full layout of the building wasn’t known to us. Being short a floor meant trouble for us.

“Wards on the door,” said Grak in a low voice, looking through his monocle. He winced. “Three varieties of vaporization, none affecting us, but it says unpleasant things about Sheriot’s skill. She’s better than I thought she was.”
“Any detection?” asked Fenn. “Or are we good to breach?”

Grak hesitated, then unhooked his axe and pulled back the leather sheath that covered the head. Warders were, as a general rule, useless in any combat scenario where they couldn’t dictate the terrain ahead of time. I wasn’t quite sure what Grak was capable of, but I was hopeful that since he was my companion he’d be capable of something.

“We’re going in hot then,” I said. “Assume that we’re compromised from the word go.” I hesitated and looked at the door. It swung outward, toward the stairwell landing, “Just a sec.” The Anyblade was a small dagger in a hidden sheath beneath my shirt, but when I pulled it out I made it into a thin, hard knife with a blunted point, thin enough that I was able to use it to pop up the pins that held the hinges in place. With those gone, there was nothing holding the door in place by the pressure of the hinge pieces against each other. “Fenn?” I asked.

She held Sable forward and pressed the glove against the door. Ten seconds passed by, and I tried not to hold my breath, because there was a good chance I was going to need all available oxygen to deal with whatever was on the other side of that door.

When the door disappeared, we were greeted by two people in a small, unadorned hallway. The woman was leaning up against the wall, facing us, one leg propped up and her hand on the man’s shoulder, beside his breastplate. He was leaning into her, away from us, with very little room between their faces. There was just enough time for the smile on the woman’s face to fall before Grak’s axe flew through the air at them, cleaving straight through the woman’s skull. The man turned to look at us in shock and horror, blood covering his face, and an arrow caught him point-blank in the eye, driving him back against the wall.

Collateral damage. My dad had always hated that word, the way it shirked responsibility from the people killed for no goddamned reason except that they were in the way of the objective. I’d known that it might come to this, but I hadn’t thought it would be so soon. This had been the sort of morally grey situation that I always forced my players into, it shouldn’t have been surprising to find one here.

“That’s the warder down,” said Grak in his low voice. He held his hand out and the axe flew backward, spinning dangerously fast, to land in his grasp. I stared at him. “Sheriot,” he said, pointing his axe at the woman whose face had been nearly cleaved in half. And he was right, of course, if I had only been focused on the words the game had written.

Sheriot Trosty defeated!

Trifles Tower guard defeated!

“No one coming,” said Fenn at a whisper. She pulled a metal nail with runes on it from Sable and briefly placed it first in Sheriot’s brain, and then in the guard’s, pulling both their souls out and putting them into a small glass bottle. As a seeming afterthought, she touched both bodies for the required ten seconds and put them into Sable. “We should move.”

I kept my objections to myself as I tried to work through the wave of dissonance. No, that hadn’t been some random maid or receptionist flirting with a guard in a back hallway, it had been the woman that had helped Aumann kidnap Amaryllis, and wasn’t that just fucking convenient, enough that I felt my anger growing at the way the game was jerking me around. It wasn’t just that happenstance had led us to an unreasonably good ambush, but the moral convenience of killing someone who deserved it.

We moved down the hallway with Grak in the lead, his monocle occasionally going up to his eye to look for more wards. There were occasional rooms that we looked in on, Fenn with her bow at the
ready, and me with the void rifle behind her, but they were bedrooms or sitting rooms, and one was a
kitchen. This floor, then, was the place probably where Aumann kept his closest staff, most of them
either gone to oversee his businesses or temporarily teleported away from Barren Jewel to seek out
whatever buried treasures Amaryllis had told him about. I was pretty sure Aumann being stretched
thin was one of the reasons that Fenn hadn’t pressed too hard about the speed we were putting this
into place; it was another way in which time was not on our side.

The hallway we’d been following eventually turned a corner and opened up into a large room with a
wide staircase leading up. It was beautiful and detailed in a way that I hadn’t expected; the call of the
gold was supposed to be a constant pressure on a gold mage, something that pressed on them, which
I had thought would lead to miserly behavior. Here, instead of that, there was a tastefulness and
delicacy that spoke to incredible amounts of money, the kind of money that allowed you to have
things be simple because you knew that they were perfect.

There was a single guard standing next to the staircase, idly reading a paperback book and turned
slightly away from us. Fenn raised her bow, popped an arrow out of Sable, and silently nocked it.
The arrow punctured a hole in his head before he could react to the sound of the bowstring. This kill
wasn’t quite so clean; he turned around, dazed, and when he spotted us something like a word came
out of his mouth. He was clutching at where the arrow had gone through his head when Fenn
followed it up with a second one, and this one made him crumple to the ground.

Trifles Tower guard defeated!

We hesitated, waiting for someone to come running, or some kind of reaction, but there was none. I
had a bad feeling about this, not just the revulsion at the fact that we were killing guards who were
just collecting a paycheck, but this was seeming entirely too easy. In the real world, sometimes things
were easy, but in a game, ‘too easy’ meant that the tone was just being set for a major fight.

We had a brief, quiet conversation about what our plan was. The grand staircase leading up was the
logical path to take, but there was another hallway on this level. The elevator that most people would
have taken up to get to the nineteenth floor was opposite the stairs, and I was just thinking that I
should deploy my Lecher’s Vine around the elevator door to warn against intruders when we heard
the ding of an arriving elevator.

Fenn was the first to react; she sprinted toward the stairs, then turned around and loosed an arrow just
as the doors opened up. The arrow split itself, so there were more than two hundred by the time they
reached the elevator itself. The elevator operator, a boy with a wolf’s ears who looked to be in his
early teens, was partially shielded by where he was standing, and he twirled to the side as he was hit
by a few of them in his arm and leg. The elevator’s other occupant was a man in a business suit and
spectacles, and he was hit by at least a hundred of them. Where the points of the arrows hit him, they
stopped completely, and for just a second he was standing there looking like a pin cushion, arrows
touching him but not actually piercing him or his clothing.

Then the arrows all fell to the ground, and him without a scratch to show for it. That was when he
pulled out a handgun and started firing on us.

We scrambled for cover. The still mage, Echert, was shooting at Fenn, since she was the clear and
present threat, his shots deafening, but she was either lucky or fast enough that three shots managed
to miss her before she was hidden behind a couch. Grak pushed over a table for cover and began
using his wand to create a ward, but I couldn’t fathom what that would be given how long wards
took to make.

I raised up the void rifle and took my shot with a loud thunk, which opened up a hole in his left arm
that was mostly visible by the blood that pooled from it. That unfortunately got his attention focused
on me. I got three fairies out of my belt and stuffed them in my mouth just as the first bullet hit me in the chest. Maybe I was imagining things, but I had the distinct sensation of blood being pushed through my veins the wrong way. I definitely wasn’t imagining the pain of a broken rib. I chewed and swallowed the fairies, trying to move enough that his next shot wouldn’t also hit me, but we weren’t far enough away from each other, and the void rifle had a four second cooldown. I put the pulse of my blood into a Sanguine Surge that allowed me to dodge another shot and begin moving toward cover, but the still mage was moving on his own now, trying to close the distance between us.

Grak’s axe came sailing through the air and struck the still mage in the neck. I thought it was more for a distraction than anything else, because still magic’s whole deal was bringing things to a halt, but though the axe was stopped, it still had an effect; Echert suddenly had an extra foot of hair getting in his eyes.

I shot him again, this time hitting him in the stomach, which was not at all where I’d intended to put the hole. He grunted in pain and raced toward me, heedless of the wound, trying to get me within reach. I wasn’t sure how many bullets he had left in his gun, but I knew he was trying to get a grip on me so he could stop me in place and then kill me at his leisure. I threw the void rifle to the side, because I knew I wasn’t going to get another shot with it, and then raced toward him, which gave him pause. When I grabbed him around the neck he stared at me in confusion. I was stopped in place, naturally, that was the nature of his magic, it was practically instinctive on his part. That didn’t stop me from using my tattoo, the Icy Devil, which sheathed my hand in ice.

He got the brain freeze a moment later and released his stilling grip on me, but that did nothing for the fact that I was still clutching him tightly. He tried to bring his gun up, and I moved my other hand to block him; he shot me just above the hip, and that hurt, like being smacked by a baseball bat that left a burning pain inside me, but it didn’t actually help his situation any. He stopped me in place again, fighting against the cold going straight to his brain, and lifted his gun higher, trying to get it pointed at my head. I could feel something else, a killing intent from him that was striking at my chest. One of the ways that a still mage could kill was to stop your heart for long enough, but some people could shrug it off, and so far it seemed like I was passing that Save or Die check.

Echart Halderson defeated!

The grip of stillness was lifted with a thunk that came to my right. I grabbed all the remaining fairies from my bandolier and stuffed them in my mouth as I sank to the ground. I really, really needed to stop getting shot, and I hadn’t had a level up in what felt like far too long. The fairy magic went about magically healing my wounds, and I looked around for the others, only to find that they were both by the elevator; Fenn had taken a fairy from its storage space within Sable and shoved it into the kid’s mouth, but he was limp and breathing shallowly. She was trying to get him to chew, trying to work his jaw around the marzipan, but it wasn’t working. I limped my way over as my wounds started closing, keeping an eye on the bar that showed my hit points, which had dipped down to 5/36 but was now steadily rising.

I took bones from my bandolier and applied healing, but he was badly injured and I was mediocre at bone magic, which meant that the work I was doing wasn’t enough. I hadn’t brought them with for the healing, that was what we had fairies for. I’d brought them for a burst of speed or power. It wasn’t long before I’d emptied all ten bones, casting them aside one by one as I’d drained them.

“Give me a corpse,” I said.

Fenn gestured toward me with Sable and the body of the warder, Sheriot, materialized in thin air and fell to the floor. I grimaced and stuck my fingers in her brutalized face, feeling the ragged ridge
where her skull had split, then reached out to the boy with the furry ears and rested my hand on his. Grak cottoned on to what I was doing fast enough and started hacking at Sheriot with his ax, biting down to the bone so I could leech END from her and put it into the kid. Each time he hit her corpse, her hair grew out a foot, until it was a tangled mass on the ground.

“Contact, site B,” said Grak, right as I was finishing up the final touches. I’d drained eight of the bones from Sheriot’s corpse, one after the other, and the bleeding had mostly stopped. Fenn looked pallid, maybe because she hadn’t wanted to kill this kid, or maybe because of the copious amounts of blood.

“Let’s fuck off out of here then,” said Fenn. “He’s stable?”

“Yeah,” I said, though I wasn’t sure that I wasn’t just giving her a polite lie. The game had not informed me that we’d defeated a random teenaged elevator operator, at least, and he was still breathing with a weak pulse.

As we went up the stairs to the twentieth level, I was pretty confident that at the very least, there probably weren’t more people coming for us. The handgun had been loud enough to be heard on the floors below, and if someone was coming, then they would have probably come by now. I had refilled my bandolier just in case, but Aumann was at the second lure, presumably with his revision mage in tow, and that only left the velocity mage, who supposedly never went into Trifles Tower. Of course, if she were to get a phone call, she could arrive in a flash ...

The top floor of Trifles Tower was a single wide, open room with a large bed, doors leading to a porch, a kitchen area, shelving, and various curios lining the walls, which went up nearly thirty feet before coming to a sharp point where they converged. I didn’t really have time to look at any of that though, because Amaryllis was standing at the doorway of a small room that seemed to have been partitioned off from the rest of the place.

The intervening days since we’d last seen each other had not been kind to her. Her right arm was too skinny and horribly yellow, withered like it had aged a hundred years. The nails on that hand were no longer there, leaving only red divots at the end of her fingers. She had dark bags under her eyes and her hair was stringy. She was wearing only a plain shift that left her looking shapeless.

*Loyalty increased: Amaryllis lvl 8!*

Her mouth moved, but we could hear no words.

“Wards,” said Grak as he moved forward with his monocle up. He turned to look at us. “Look for the gold. Sheriot on her own wouldn’t be enough to put up vaporization wards against blood, bone, or skin, you won’t run straight into death without me.” He tapped his wand against the wards around the doorway and frowned.

“We’re getting out of here,” said Fenn. She slipped Sable partly off so her fingers were holding onto the edge of it, and swung the empty parts across the ward, where Amaryllis caught them. Ten seconds later, Amaryllis had disappeared, and a second after that she was standing on the other side of the ward.

“He has the key,” said Amaryllis, without so much as a thank you, a glance in Grak’s direction, or any acknowledgment of the absurdity of us being there with her. “The tattoo is still sealed, but it’s on his body. He doesn’t know what’s inside it.”
“Nice to see you too,” said Fenn. “You’re welcome.”

Grak dropped to one knee. “Princess Amaryllis, I am honored to make your acquaintance.”

“We need to go,” I said. “No telling how long until he gets back.” I turned to Fenn. “I’m a fan of glove-out-the-window.”

“My things are in his vault,” said Amaryllis. “It’s down on the floor below. Ten seconds each for the blade and the armor, once we break past the wards.”

“Forgive me, princess,” said Grak as he rose to his feet, “But I don’t think that it will be so easy as with the ones that caged you. An absolute ward against velocity would prevent that trick from working.”

“Then we’ll figure something out,” said Amaryllis.

“Here,” said Fenn, taking out a fairy from Sable and handing it to Amaryllis. “You’re not looking too hot.”

“If we have limited time, we should go down to his vault now while we can,” said Amaryllis. She bit the head off the fairy and swallowed it without stopping to chew.

“No, we should leave,” said Fenn. “We can’t beat him and having your stuff won’t help you if you’re dead.”

“Agreed,” I said. “I have a quest to save you, it’s not complete yet, that means that it’s not a foregone conclusion that we can leave.” Grak gave me a funny look at that, but he’d have to have been an idiot to see everything I’d done and not have his questions. I was more focused on getting all of us out of there, because if I were running this game, I would be sorely tempted to force a final confrontation with the primary antagonist if it was at all plausible for that to happen.

“Contact, site C,” said Grak. “He was a lot faster the second time.”

Fenn held out Sable and grabbed an oxygen tank (with a mask) that materialized out of it. “Now.”

“His gold is in that vault,” said Amaryllis. “We can end him.”

I could see by Grak’s face set, and Fenn’s eyes roll. We weren’t exactly set up as a democracy in this party, and we didn’t have the conflict-resolution channels that it would have been nice to have, which meant that this was either going to be solved by debate or by seeing who could dig their heels in furthest, and we didn’t have time for either of those.

“We’ll go to the vault,” I said. Better that we do something than nothing.

Loyalty increased: Grak lvl 2!

I could see by the set of Fenn’s teeth that she was pissed off, but she started toward the stairs all the same, and the breathing apparatus vanished back into the glove as we moved.

We went down the other wing this time, past more rooms until we got to a solid iron door. Grak immediately ran his wand across the ground back the way we came and spent a valuable minute of
our time on erecting a ward against high velocities before turning back to the door we’d been staring at. With his monocle out, he looked at the door and grimaced.

“Wards are heavy, absolute velocity, blood and bone to stop us, but all three breakable in five minutes. A few more are there too, which don’t matter. The physical door is a problem.” Grak reached forward and touched the heavy lock, which looked like it was going to require a key, the kind that Aumann was sure to keep on him at all times.

I stepped forward and drew the Anyblade, shifting the hilt around until it was roughly key-shaped, then stuck it in the keyhole. The Anyblade wasn’t meant for this work, I knew it, but I also knew that this was something that Reimer had done time and time again, until I started having every villain in the land use two-factor. It wasn’t terribly much work to feel the resistance of the springs and wiggle the blade-hilt around, though it probably would have gone a lot faster if that had been one of the things that I had practiced. Eventually I got it, turned the blade, and opened up the vault.

Inside were three suits of armor, five weapons, a handful of other things I assumed had to be magical if they were sitting there waiting for us (among them a pile of rope and an armchair), and there, right in the middle, a pile of gold. I was pretty sure that the entire thing could fit into a few cubic feet, maybe even a single cubic foot. It was far from being a dragon’s hoard (though those were always far too big to make any sense), but it was definitely worth millions of dollars. Call of the gold aside, it made it almost tempting to become a gold mage, if you could get so much power from such a (visually) small amount. There were a few gold coins and pieces of jewelry, but most of it was just in the form of stamped gold bars.

Grak began work on breaking the wards, while Fenn began probing at the wards using her fingers. I wasn’t quite sure why she was doing that, because she knew as well as I did that an absolute ward against velocity meant that you couldn’t do things like poke the finger of a glove across, because it would stop any and all movement at its border. A void rifle could get past it, because the void went through things without any velocity (bullshit, if you asked me, but the void was also “not magic”), and light was apparently not included as a thing that had velocity (because otherwise the room would have been completely dark), but there was very little else that would get past it.

Amaryllis had taken the void rifle and was sitting prone on the hallway floor sighting down it, applying pressure to the trigger with the index finger of her withered yellow arm. The red pit where her fingernail had been was weeping a clear fluid.

“Are you okay?” I asked.

“No,” said Amaryllis. “When this is over we’re going to need to seek out some very expensive healing. ‘Rat rot’ is progressive.”

“I meant more … whatever you went through,” I said.

“Not the time, Joon,” said Amaryllis. She hesitated, as if remembering how to be a person. There was no way she had missed the copious amounts of blood on the floor by the elevator. “Thank you.”

Fenn laughed at that. “I’d say don’t mention it, but you almost didn’t.”

I wanted to say something then, to express how much trouble we’d gone through, or how much I’d been thinking about her, or even to ask her whether she had known or suspected that Uther Penndraig was dream-skewered, but Grak finished his work.

“Wards are down, spoofed my way past them,” he said with a feral smile that didn’t look quite right on a dwarf’s flat, wide teeth.
Fenn moved in at once, going straight for the armor, which I thought was weird until I realized that they were probably going to be the hardest things to move. As Sable started sucking them up one by one, I pulled out a folded up sack out of a tattoo on my arm and started loading the gold into it, one bar at a time. The gold bars were incredibly heavy, even with me knowing beforehand that gold is very dense and hard to move. A solid cubic foot of gold weighed something like 1200 pounds. Grak began helping me and we’d moved over about half of it, one twenty-pound bar at a time, when Fenn came over and grabbed the sack with her black glove. Sable took about ten seconds to suck up something, and it couldn’t do multiple things at once, but ‘thing’ was a loose definition as shown by the fact that it didn’t strip us of clothing when we went inside it. That was one of the reasons that I’d used a few applications of the Surface Sheath to put folded up sacks on my skin. While our sack of gold was counting down to vanish into the glove, I pulled out a second one, which Grak and I kept filling.

Thunk.

At the sound of the void rifle I abandoned my task and ran out of the vault to the hallway, drawing the AnyBlade and extending it to dagger length. I was just in time to see Aumann fall over with a hole in the middle of his forehead, his bracelet and necklace of ball bearings falling apart and scattering to the floor, the muscles under his red and white mottled skin going slack.

And then I was treated to the sight of those ball bearings reversing their motion and coming back to him as he rose up from the ground, with movements that made no sense unless physics were running in reverse. I dashed forward, sword drawn, none too hopeful about my chances, and brought the Anyblade down in the form of a two-handed greatsword that nearly clipped the ceiling, right as I saw the hole in Aumann’s forehead fill in with flesh.

The Anyblade hit him in the head and clanged off him, twisting in my hands. Aumann stared at me in confusion for just a second, then brushed the Anyblade with the back of his hand, sending it flying from my grip and through the wall, breaking several bones in my hand. Then he touched me and the world lurched sideways.

**Affliction: Cowardice Removed!**

When I came to I was in abject pain. My left arm wasn’t broken, so I used that to reach into my bandolier with a shaking, bloody hand and pull out more fairies, which I shoved into my thankfully also-unbroken jaw. Chewing was still a pain though, and swallowing was downright excruciating, because I had only a single hit point left, and the state of my body reflected that. Reimer had always said that health didn’t matter until you lost your last point, and that was manifestly not true in my case, but at the very least, everything else was recoverable.

I got to my feet with a gob of too-sweet marzipan in my mouth, grunting at the feeling of pressure on my newly healed legs. I was in an office of some kind, with books and papers scattered all around and a hole in the wall that was just about my size. I had no idea how much time had passed during my blackout, but it couldn’t have been that long, since my blood was still wet and not at all crusted. I limped forward as I kept on swallowing down fairies, running through my entire bandolier for the second time that day.

I was nearly to the hole in the wall when I saw metal balls zip past, fast as bullets, then a man’s voice, Aumann’s, say “There are wards”.

That was the first thing to give me hope. Aumann was powerful, powerful enough to flick metal balls away from him as fast as bullets, powerful enough that his telekinesis hit me as hard as a car, and he had a revision mage who was presumably going to stay close to him, but he couldn’t see wards, and a warder was at their most dangerous when they’d had time to prepare the battlefield. Of
course, Grak hadn’t prepared the battlefield, but Aumann didn’t know that, and he would have seen his bullets slow down to non-lethal speeds.

Barrier wards were the easiest, most common type of ward, but there were area wards too, like the ones that they used to stop teleportation, and if I were Aumann, I would be extremely worried about gold magic denial that would keep me from being Superman, or something that would stop revision magic from healing me up from another void rifle shot. And if I were Grak, I would be putting up those wards as quickly as possible at the border of the vault they were all presumably hiding in.

Sable wasn’t cutting Aumann’s ‘connection’ to the gold, but I was pretty sure that our side would win any war of attrition, because even if Sable didn’t count as taking the gold out of his control, then surely directly destroying the gold would. And Aumann knew that we had the void rifle, and he had to be able to model us well enough to know that we were willing to give up a little bit of gold in order to depower him, which meant that he knew he was on a time limit.

Which left me, standing in a ruined office, with no weapons to speak of save for the tattoos that laced my skin, and no real plan. The Anyblade had been flung somewhere, I assumed that Amaryllis, Fenn, and Grak were hiding in the vault, maybe even with the door closed, and Aumann … if it were a game I were running, and anyone even moderately cautious was playing Aumann, this was right around the time that they would bust out the 11-foot pole.

Another metal ball went zipping by, but a few moments later I saw it flying back through the air the other direction. Revision magic, testing for invisible wards, which meant that the revision mage now had line of sight down the corridor. So long as the revision mage was there, Aumann could be more bold in moving forward, and he could test for wards against gold magic, and when he found none there was pretty much nothing stopping him from tearing his way into the vault and killing everyone inside it.

I looked around for a weapon and found a heavy metal paperweight on the desk, which I picked up and hefted. Against the gold mage, it would be useless, but against the revision mage … well, they had the truly absurd ability to revise themselves in the event of their death, injury, or incapacitation, which meant that he was basically unkillable (with a few asterisks, but not ones that applied to a guy holding a paperweight).

So I sat there, positioning myself next to the hole in the wall, trying to get as good a view toward the vault as I could, hiding so that if (when) Aumann walked by I wouldn’t be in his direct line of sight. I had the paperweight hoisted like I thought it would do something.

My breath caught in my throat as I saw Aumann walking closer. He held a cane in his outstretched hand, which he was swinging from side to side like a blind man. As I looked closer I saw that he wasn’t actually holding the cane, it was telekinetically stuck to his palm. If my guess was right, he was wrapping the cane in his tactile telekinetic field, which meant that as soon as he hit a ward against gold magic he’d be able to feel it and stop there.

Through the hole in the wall I saw the revision mage follow behind. He was a slightly overweight man with a ponytail, wearing a brown, buttoned-up jacket and khakis. We had staked out Trifles Tower a few times when testing how fast Aumann’s response to gold was, and I had seen the revision mage, Colwin, a few times, flying away with Aumann. I could just barely see everything from my position, Colwin following Aumann, and the vault door that was only partially closed.

When I saw a small hint of pure black come out from behind the vault door, I sprang into action, and a number of things seemed to happen all at once, some of which I would only learn about later.

Amaryllis popped out of Sable, materializing from the extradimensional space with her void rifle up
at her shoulder and a fair amount of pressure already on the trigger. She fired off her shot a fraction
of a second after appearing, putting a hole into Aumann’s head for the second time that day. Colwin
put out a hand to start reversing that the moment it happened, but that was just about the time I came
out through the hole in the wall and bashed him in the side of the head with a blood-magic-assisted
paperweight.

It cracked his skull and left him falling to the ground, but then the both of us were moving backward
in time, erasing my memories of any of that happening, and the second time around he ducked
beneath my wild swing. I came at him a second time, reversing my swing to hit him with a
backhand, once again fueled by my blood, and hit him full on in the base of his neck, and then we
were going back through time again, erasing my memory again, and the thing was I knew this was
happening, I had read all about it in the Commoner’s Guide, I knew that single combat with a
revision mage was essentially pointless, I knew that I must have been landing those hits because
there was no way that he was dodging from blows he couldn’t even see coming.

But I also saw Amaryllis, who to my fractured perception was teleporting down the hallway towards
us, holding a sword hilt in her hand, and after the third time I hit Colwin, I stopped just shy, because
Amaryllis was right next to him and he had a sword sticking straight through his head. I saw him
move back and forth along it,

I was wrapped in a golden glow, tinged with red this time, and it was like a goddess had taken my
brain out of my skull, trailing every yellow-white nerve from it, then stuck it into her mouth and ran
her warm, sucking tongue along the tip of every nerve ending. It was bliss, pure and yet still
unrefined, and once it was done I was left looking at my fingers in wonder, like someone had put me
back together wrong. I still floated in the air and sent out a gust of wind, but I wasn’t even aware of it
until afterward, as I was coming to.

And yet the bones of my ribs and my left hand were still devoid of their energy, and the quest to fix
them hadn’t gone away, because no, the game hated me, it had the capacity to give me limitless
pleasure and locked it away behind the all-too-brief moments when it decided that I had done a good
job, it had the ability to heal me completely but for whatever bullshit reason it had decided that me
doing the clever thing and using my own bones as fuel was too clever and had to be cured because
life couldn’t ever be fucking fair, it was a constant march of brutality and pain with --

“Stop,” said Fenn. She was standing beside me with a hand on my shoulder, looking me in the eyes.
My foot stopped whatever it had been doing, which, when I looked down, was apparently kicking
the revision mage’s face into a bloody pulp. I looked back to Fenn, who was staring at me with wet,
worried eyes. She stepped closer and shifted her hand, so she was grabbing my neck, then gave me a
quick kiss on the lips. “I thought you were dead,” she said as she backed away from me. “If you do something that dumb again I am going to kill and eat you, do you understand?”

I wasn’t sure whether she was referring to me fighting the gold mage or me fighting the revision mage, but either way she was probably right. I looked over to Aumann’s corpse, which Amaryllis was squatted over. She had stripped off his clothing and was bringing a knife to bear against his rib cage, making a careful cut to his still-warm skin next to a tattoo.

“Wait,” I said, moving forward. “Azalea.” The tattoo glowed for a second, giving off light blue sparks around the outline of the wrapped package, and when I stepped down to grab it, it came off the skin easily, the two-dimensional image expanding to three dimensions in my fingertips. I pulled off the twine and unwrapped the cloth, then looked down at the teleportation key.

“Why that word?” asked Amaryllis. She had looked exhausted from the moment we first rescued her, but now there was no longer a fire in her; whatever thoughts had been sustaining her, they were gone, leaving her vacant.

“Tattooist picked it,” said Fenn. “He probably saw the family resemblance.”

Amaryllis closed her eyes and nodded at some piece of cultural knowledge that had apparently passed me by. Vervain the flower mage had been Uther Penndraig’s equivalent to Merlin, and flower names were common among the Penndraig lines, but I had no idea who Azalea was and it seemed like the furthest thing from important at the moment.

“We should clear the rest of this,” said Grak from beside the vault door. “I see we’ve got a teleportation key, that should make the getaway a mite easier.”

The rest was cleanup, the kind of thing that you never want to deal with when you’re in the middle of coming down from having finished something hard. Fenn took the corpses of first Colwin, then Aumann, and after that we stole everything else that was left in the vault, putting it all into the glove, and even then we weren’t done, because there were, predictably, wards against teleportation within Trifles Tower, which Grak finally identified a gap in back on the top floor patio.

We left, with Amaryllis again operating the teleportation key, and after a painful moment -- a pain that caught me by surprise, because I had forgotten -- we were standing in a forest of trees so tall they would give redwoods a run for their money, standing at least a mile from a large house in a clearing, with a roof of grass and wildflowers.

“Check for wards,” said Amaryllis after she spent a moment looking around. Grak paused for a moment, and I didn’t know him well enough to make an accurate prediction about what he was thinking, but my best guess was that he was wondering whether this was his life now, going around with clearly insane people with mysterious powers who had stolen millions of dollars worth of gold and magic items and casually used a billion dollar piece of magic to move across the world. But he didn’t say anything about any of that, and instead pulled out his monocle to look around.

“Some around the house,” he said. “Built into the stones, at a guess, but we’ll know more when we get there.”

Amaryllis nodded, then just stood there for a moment, swaying, and I managed to catch her as she collapsed.

END BOOK II
“So, we have a teleportation key,” said Grak in a conversational tone as we walked across the forest floor with trees towering above us and blocking a fair amount of the light. The dwarf tugged on the dyed-grey braids of his beard as we walked and occasionally moved his warder’s monocle to his eye to peer at the house we were walking toward.

I was carrying Amaryllis, who was out cold, cradling her in my arms. Her yellow, withered arm and the red marks where her nails had once been were painful to look at, so I mostly kept my eyes forward instead of looking down at her. She tensed in my arms occasionally, fluttering her eyes open for long enough to make sure that I was still carrying her and then falling back into something like sleep.

“The first thing I learned when I joined this crew,” said Fenn, “Is that you can’t expect to get answers to your questions right away, and you can’t expect that people will tell you things that it might have been good to know.” She held up a finger. “For example, it was only three days ago that I learned our pal Juniper was friends with Uther Penndraig.”

Grak sniffed. “I don’t like elf jokes,” he said.

“They’re half-elf jokes,” said Fenn, twitching her pointed ears. “And I do have to say that they’re an acquired taste. So far Juniper is the only one to have acquired them, and it took him quite a while.”

“Nah,” I replied. “I liked you from the start.” Carrying Amaryllis was less of a strain than I thought it would be, but then again, I was fresh off a level up and she had lost weight while she’d been locked up in the castle. I didn’t like seeing her so frail.

“Aw, I liked you too, little hooman,” said Fenn.

Grak coughed into his fist. “It isn’t in dwarf nature to be roundabout,” he said. “I was trying to do you the courtesy of allowing you to give an explanation for the teleportation key of your own accord. Tell me where it came from.”

“It belonged to Anglecynn,” I replied. “They were using it to … violate imperial laws regarding exclusion zones, I guess, or something like that, and they were trying to keep the fact that they’d lost it quiet. We grabbed it out of the Risen Lands exclusion zone.” I was skipping a few bits in there, not because they weren’t important, and not because I was actively trying to keep anything from Grak,
but because it seemed like it was going to take forever to explain. That was the same reason that I said ‘nevermind’ when Fenn asked me what a Rickroll was.

“And what is this warded place we’re going to?” asked Grak.

I looked down at Amaryllis sleeping in my arms. “Fenn?” I asked.

“No clue,” she replied cheerfully. “When we left the lands of the undead, the place Amaryllis chose to take us was Barren Jewel, where we had a delightful misadventure in the desert.”

“In the desert?” asked Grak with a raised eyebrow.

“She picked Barren Jewel because it was a place where we could acquire a safe spot to use the teleportation key, where we could get some healing, where no one would be looking for us, and close by to a supposedly-secure location where we could acquire lots of valuables,” I said. “So working from that, I would guess that she chose this place under similar criteria, though,” I looked around, trying to see some hint of what lay beyond the forest but finding only trees, “I don’t think we’re terribly close to civilization here, unless I’m missing something obvious, and my guess is that we’re probably short on some other relevant criteria as well.”

“Hence checking for wards,” nodded Fenn. “Might be this was one of the places that Princess Amaryllis was expected to go, one that they’d have sent people to once they figure out she was alive, or at least once they knew that she wasn’t dead, if they do know that. I guess all they know is that they don’t have a confirmed kill.”

“How long was she captured?” asked Grak, who was taking all this in remarkable stride.

“Seven days total,” I replied.

“Aumann would have interrogated her,” he said. “He would have broken her bones and peeled off her skin until she told him everything that she knew. He had a revision mage to undo the damage and wipe her memories. He was sending people out to locations that she named.”

“And he’s dead now, so that’s,” I stopped. “Moot. Except it’s not, because if he was sending out people, he might have sent them here, except … the keys only go to touchstones or places you’ve been before, which means that they would have had to set down wherever the closest one of those is and would be making their way here right now.” I cursed under my breath. “And unless Aumann was running really tight infosec, which we know he wasn’t, then information about Amaryllis might have leaked back to her so-called family.”

“That’s if Aumann didn’t tell them directly,” said Fenn. “I mean if you’ve got a belligerent princess you know would gut you at a moment’s notice, are you really going to keep her around like a caged tiger waiting to attack? I wouldn’t, but that’s partly because I know her. She’d figure out a way to slip poison into my cup halfway through the first day.”

“He was sending people out to hit all the supply caches,” I replied. “He wouldn’t do that if he was planning to sell her to the highest bidder.”

“Of course he would,” said Fenn. “You remember what he said to us, the value of a thing is in what people will pay, it wouldn’t be enough for him to sell Amaryllis to the people that want to kill her, he would do that and then go to the next-closest descendant of Uther Penndraig and say, ‘Hey, how much you want to give me for this magic rope I stole?’”

I grimaced at that, because she was right, that was exactly what he would do.
Up close, it looked like someone had built an estate house and then picked up the grassland like a blanket to tuck the house in for the night. I wasn’t entirely sure whether the house had been built on flat land and then earth had been filled in after it with new grass put down, or if the house had been carved into an existing hill. The terrain around us was mostly flat though, so I thought it was probably the former. Either way, it was a pretty, picturesque place in a clearing, with wildflowers all around it and a shaft of sunlight coming down that couldn’t have been more perfect if it had tried. There was furniture outside the house, most of it looking like highly polished driftwood, a long table with eight chairs arranged around it, a pair of benches set beside a fire pit, a swirling garden, and rocks placed in a decorative ways that made them seem as though they’d been found there.

“We get it,” said Fenn, “You’re rich.”

And yeah, this place was like a giant finger to the proletariat, not just because it must have cost an enormous amount to build and maintain, not just because there were no roads that I could see which meant that goods and people would have to be teleported in at outrageous expense, but because the place was cozy, Hobbiton cozy, rich-people rustic, and we were in the middle of an immense forest, but the word ‘gentrification’ did enter my mind.

“Nothing suspicious about the wards,” said Grak when he finished lifting the monocle to his eye. “No detection wards that I can find at a distance, and only the usual wards you’d find on a high-value building, proof against teleportation magics and unreasonably high velocities. Expensive wards, the work of multiple warders, a few of them ornamental.” He pointed to the rocks, then just above the large table. “Wards against water, so a dinner party doesn’t get rained out.”

“You think we’re safe to go inside?” I asked. Amaryllis had started getting heavy a quarter mile ago and though it wasn’t at all chivalrous, I really did want to put her down.

Grak nodded. “That means that anyone else would be too.”

We made our way slowly and carefully, looking at the windows. Fenn offered to slip a mask and tank on Amaryllis and put her in the glove so I could walk easier, but I vetoed that idea for obvious reasons. I was hoping that it wouldn’t come to that; there was a reason that Amaryllis had taken us to this place, and I was hoping that it was because she thought it would be safe but useless, a place for us to recuperate and plan our next move.

The front door wasn’t just unlocked, it didn’t have a lock. We moved inside to see a place that was much like the outside, making pretenses towards an organic, rustic feeling. An enormous fireplace dominated the living room, surrounded by plush furniture trimmed with polished branches. Based on the size of the hill the house was nestled in, the twenty-foot ceiling made this the largest room in the house, with doors leading in all sorts of different directions.

I set Amaryllis down on the couch and lightly touched her face, brushing aside stringy hair.

“We’re here,” I whispered.

She opened her eyes and looked at me. “Safe?” she asked, shivering somewhat.

“Probably,” I replied. “Get some rest. We’ll have some questions when you wake up.”

The three of us moved through the house one room at a time, looking in on each of them, Grak doing so with his monocle to search for any wards. Most of what we found wouldn’t have been too out of place back on Earth; they were bedrooms, bathrooms, a large kitchen and a dining table there, a small library with a desk that I was definitely going to check out later, but certainly nothing that seemed all that Aerbian to me. Sure, the construction was obviously not drywall and two-by-fours,
and the pictures on the walls were of fantastical scenes and mysterious beasts, but there was nothing that screamed magic or parallel universe, at least not until we went down into the basement and found the souls.

There was a big glass barrel half-full of those little balls of light, jostling gently against each other on the bottom. Beside this was an engine of some kind, which was putting out a faint hum that had been blocked by the heavy door to the basement. It took my mind a moment to realize that what I was looking at; it was a generator, the reason that this place had power was because on Aerb they just casually used some kind of mad science process to make embryos bud off and create more souls, whose decay was used as a power source, and they kept it right next to the hot water heater like it was nothing.

Fenn went over to the barrel, pulled a glass plug from the top, and then pulled her own glass bottle from Sable, her magical glove. She emptied six souls into the barrel with hundreds of others, then put the plug back in place.

“That’s my good deed for the day,” said Fenn. “Takes a special kind of shitty person to send someone to the hells, no matter how much of an ass they are.” I agreed with that, I suppose, but there was a probably-not-morally-justified part of me that thought Aumann deserved worse than he got.

The only other room of note was a storage area in the basement, a huge place where the aesthetic of the above rooms had been mostly forgotten. Instead of wood floors, there was concrete, scuffed with use and with an open area that had careful marks painted onto the floor. I had seen something similar when we had gone to Caer Laga. This was where anything they were in dire need of could be teleported in, something that was usually done in bulk. What this place had, which Caer Laga didn’t, was a stockpile of dried foods and a walk-in freezer, ensuring that we wouldn’t have to resort to magic in order to stay fed. A cistern beside that was full of fresh, clean water as well.

When we went back into the main room, Amaryllis was up and had just finished starting a fire in the fireplace.

“This place is Weik Handum,” she said as she poked at a log. “It’s known to many. We might have to leave in a hurry.” She turned toward us, finally locking eyes with Grak. “I’m sorry for my curtiness earlier.”

“It’s fine,” said Grak. “A dwarf understands.” He stepped forward and held out his hand. “Grakhuil Leadbraids, of the clan Ligoda.”

Amaryllis gave him a curtsy, using her withered yellow hand to pull her shift slightly to the side. “Amaryllis Penndraig, tenth of her name, of the Kingdom of Anglecynn, long may it stand.”

I could practically hear Fenn rolling her eyes. “We need to get you healed up,” said Fenn. “The boy too.”

“What’s wrong with Joon?” asked Amaryllis, snapping her attention to me. “He leveled up just before we came here.”

“Bone magic,” I said. I rubbed the back of my neck. “Apparently it’s a bad idea to drain your own bones for their magic.” I could feel Grak and Amaryllis looking at me. “It wasn’t really like I had a choice, I was running for my life and needed the burst of speed, I’m pretty sure that I would have died otherwise.”

“And fairies don’t help,” said Amaryllis, more as a statement than a question, because she didn’t think so little of Fenn and I that she thought we wouldn’t think of doing the obvious thing.
“Symptoms?”

“Um,” I said. “Loss of appetite, anemia, and I’ve been breaking the bones a little too easily.” I had gained ambidexterity by raising my Dual Wield skill high enough, but now I hardly used my left hand for anything if there was any way that I could help it. There were other changes, I was sure, but it was hard to tell what they were, because I knew that paranoia was overtaking me. Was that twinge in my stomach the first sign of major organ failure? Was the hitch in my breathing coming on too fast because my lungs had been thrown out of balance? That was impossible to say without a doctor, and probably even then it would take a specialist.

“Okay,” said Amaryllis, rubbing her forehead. I noticed that she was favoring her left hand, even though she was right-handed. “Then we need a plan.”

“We’ve got nearly a thousand pounds of gold,” said Fenn. “I’m pretty sure that this is the kind of problem that you can just throw money at.”

“You have five hundred pounds of gold,” said Grak. “Half of what was in the vault is mine. Those were the terms.”

“Fine,” said Fenn. “But then we still have nearly five hundred pounds of gold, which means that we have a ridiculous sum of money to spend on getting the both of you healed.”

Amaryllis turned to Grak. “I assume that when the key is ready again, you’d like to be dropped off somewhere?” she asked. “Our options in that regard will be limited, obviously, but I’m sure we can reach an accommodation.”

Grak shifted. “Juniper offered me a share of your personal wealth, in exchange for my aid in the rescue.”

Amaryllis stared at him. “Everything I have is stored in that glove,” she said, pointing a yellowed finger at Fenn. “I do not have vast riches any longer. Every day that passes, more of what was once mine is claimed by the other members of the Lost King’s Court. There are places, such as this one, and there are secret caches left behind by my ancestors for times of need, but there’s no bank I can draw on.”

Grak shrugged. “It seems to me that staying with the three of you is the most direct path to paying the penance to my clan, if there are some terms we can find amenable.”

“Look, my character’s entire motivation is the loot,” said Tom. “He doesn’t really care that much about the cult of Epsilon, and he doesn’t believe that the gods would allow them to reincarnate a demon, so why should he accept an offer for a ‘fair share’ of the loot?”

Arthur frowned. “You’re right, actually,” he said. “I’m doing it because I think it’s the right thing to do, to appease my god, because I think that the gods won’t allow it but I’m their instrument for not allowing it, for the praise and adoration that provide the crux of my character flaw, because it needs to be done … I would go after them even if there was no loot, so why should I advocate for an equal share?”

Craig looked to Tom. “Doesn’t that just reduce us to being sellswords?” he asked. “I’m not sure that works from a keep-the-team-together standpoint once the adventure is over.”

“Here,” said Reimer, having finally found his place in the book that was open in front of him, “DMG, page 135, there’s a table for character wealth by level.” He turned the book around, offering for someone to look at it and confirm, which no one did. “The game’s assumptions about player
power level rests on us getting equal amounts of treasure in line with our experience gain, it’s what makes the math on combat encounters mostly work out. If I’m following my alignment and backstory then yeah, sure, I would give up a share of the treasure if really pressed on it, but that screws up the game balance.”

“Yeah, but if you don’t screw up the game balance then you screw up the characters,” said Arthur.

“I can fix it,” I said. “You can hammer out an in-character agreement about how to distribute the loot, then I can wiggle things around on the backend so that you get less loot from the adventure and are individually compensated by your paladin’s order and druid circle respectively.”

“Does that work?” asked Craig. “I was under the impression that we were going to get thousands of gold for this adventure, if the church has thousands of gold to spend, why aren’t they spending it on us right now, it doesn’t make sense that they would wait around until after the quest is complete, if they think the quest is so critical.”

I sighed and rubbed my face. “Okay, fine, it’s an iterative thing,” I said. “It’s important for Uther and Zackum to defeat the cult for their own, personal, moral social reasons, but if they just give in on loot negotiations then they’re going to be constantly starved for resources, especially when it comes to the next time, and they know that the risk/reward proposition is already favorable enough with an equal split. And from a keep-the-team-together aspect, the sellswords know that they’ve got a good thing going by being able to pair up with two half-healers that will keep them alive and raise them from the dead.”

“Okay,” said Arthur. “Now let’s do all that in character.”

We took some time to draw up terms. Grak would be paid a pound of gold for every two weeks he spent with us, but it would all be kept within the glove until such time as he wanted to cash out, mostly because it would be impossible for him to carry that much gold around. He would get a third share of any treasure that we found or stole, and temporary access to whatever heirlooms Amaryllis saw fit, with the understanding that it was in her best interests to keep our warder armored up. Other than that, he didn’t really care what it was we did. (A pound of gold every two weeks came out to a yearly salary of just under $2 million dollars, which seemed like a ridiculous sum to me, especially since I wasn’t getting paid at all.)

“Alright,” said Fenn, once we had a simple, written (completely unenforceable) contract. “Now for my terms.”

“There are things we need to do,” said Amaryllis. She’d taken a seat in a large chair by the fire, and was looking like she was running low on energy.

“Looking over our haul is one of those things,” said Fenn. “And I’d rather work things out before that.”

“Fine,” said Amaryllis, waving her hand.

“First, I get to keep Sable,” said Fenn, holding up the glove, which was so black it was impossible to see the contours of her fingers. “Not just for the duration of our quest to loot Lady Penndraig’s holdings and kill her enemies, but forever. If Sable turns out to need regular investiture, then Amaryllis, I’ll come to you whenever the time is about to run up.”

Amaryllis hesitated at that. Clearly Sable was more powerful than she’d thought it was from the outset. “Fine,” she said.
“Second, I don’t really have any interest in getting you back in a position of power,” said Fenn. “No offense, but the politics stuff is um, pretty boring, especially in the Lost King’s Court, from what I know of it. Instead, I want to pour our efforts into making Juniper stronger, which means fighting things and completing his quests. Not just for his own sake, but we’re inextricably linked to him.”

“What do you mean by inextricably linked?” asked Grak.

“We don’t actually know,” said Fenn. “Probably soulfuckery, or maybe Juniper is a god. Anyway, I don’t object to visiting the no-doubt hundreds of homes like this one you have and looting them blind, or using the information you have courtesy of your former position in the labyrinthine political bodies of Anglecynn, but it’s Juniper first from here on out. Deal?”

“Deal,” said Amaryllis, a little too quickly for my tastes. Juniper was a lever that could move the world, and Amaryllis wanted to be that lever.

“Third,” began Fenn.

“How much longer is this going to go on?” asked Amaryllis. “I need to lay down.” She was already laying back in the chair, resting her head against it.

“Last one,” said Fenn. “Third, I want us to go to the Isle of Eversummer and avenge my father.”

**Quest Accepted: Summer’s End - Return to the place where Fenn received her scars and bring justice to the elves. (Companion Quest)**

“I just got a quest for that,” I said.

“It worked!” cried Fenn with a small clap. “Okay, we’re going to try more of that later on, get Joon all the quests his little game brain can handle.”

“What magic possesses Juniper?” asked Grak. “I’ve already gathered that he’s five hundred years old.”

“Alright,” said Amaryllis. “Going to sleep now.” She rested her head and closed her eyes.

To my surprise, Fenn picked up a blanket laying across the couch and threw it over her. “Juniper, it might be time you made with the explanation.”

I sighed. “Alright, so I come from a place called Earth, which is a lot like Aerb in some respects and very unlike Aerb in others …”

I have to admit, I had been working on the pitch for quite some time, since before we’d even met Grak. Starting with Earth seemed sensible, say that it’s another world that has some overlap with this one, play up the nature of coincidences and the mystery of how some things resemble each other, pretend that the melange of things that I’d seen in Aerb weren’t just my own creation (which was sort of true, because I had seen a few references to Earth things, albeit ones that I had put in my games), and only then, once all that was laid out, would I say:

“So, part of what’s special about me is that I see numbers in my head that correspond to my skills and abilities, which I can increase whenever I finish the quests that appear in my field of vision.” I said this very patiently and calmly, as though it was the most rational thing in the world. “There does seem to be some correspondence between these numbers and well-studied magics, as related to me by a bone mage.”
“And Juniper’s own special brand of magic marks you as a companion,” said Fenn, which I didn’t really appreciate because it would only complicate matters.

“I see,” said Grak. He looked to Fenn. “Do you have reason to believe that any of this is actually true?”

“Sure,” Fenn smiled, “Juniper is a great guy.”

I slapped my forehead at that. “I’ve done at least six impossible things,” I said. “I mean … didn’t you see me level up?”

“What is that?” asked Grak.

“There was a bunch of glowing light, I healed completely, it happened in the hallway?” I asked.

“When I came from the vault you were kicking a corpse in the head,” said Grak.

“Okay, well … then I can’t prove it,” I said. “Fenn can tell you all of the neat stuff I’ve done, how I’m basically a savant at learning new types of magic, which you’ve seen firsthand for yourself —”

“No,” said Grak. “I’ve seen faculty, but if you’re five hundred years old that’s no surprise, it was only your apparent age that confused me.”

“I’m seventeen,” I said. I think. This body may or may not be seventeen, because it probably belonged to someone else when I slipped into it, assuming that this world wasn’t just created ex nihilo the moment right before I arrived, which it probably wasn’t.

“Fenn said that you knew Uther Penndraig,” said Grak.

“That’s … Fenn, we’re going to have to talk about what jokes it is and is not appropriate to make in front of people,” I said. “But yes, I’m operating under the assumption that Uther Penndraig was originally from Earth. I would have known him nine months ago. Ten now, I guess.” I looked over to Amaryllis, who had resumed sleeping. I hoped that this was just a symptom of her stressful time with Aumann, rather than the rat rot, because if this was the way she was going to be, then I probably wasn’t going to be able to press her for details.

“It doesn’t actually matter to me,” said Grak. “Whether you’re fooling these two or whether it’s the truth, the deal we struck is one that accommodates me. The moment you ask me to act on this strange magic that only you can see, that’s where we have a problem.”

“One sec,” I said. I closed my eyes for three seconds and brought up the character sheet, then stopped for a moment on the screen with my skills and abilities. I had leveled up twice, which meant that I should have seen a ‘+4’ floating in the upper right corner, just outside the character sheet proper. Instead, it said ‘+9’. I’d gotten five extra points from somewhere. Hitting tenth level? That seemed likely, but the game was as always stubborn with giving me information, and there was still no game log to look through.

“What’s he doing?” I heard Grak ask.

“Accessing the mystical secrets behind his eyelids,” replied Fenn.

I flicked my eyes to the side and switched screens, casually looking for any other surprises, until I got to the one labeled companions. To my delight, Grakhuil’s biography was no longer greyed out, which meant that it was probably loyalty level 2 when those were unlocked.
Grakhuil comes from the largely parthenogenetic clan of dwarves in Darili Irid (loosely, Gold Hole). Due to da nad skill in the game of Ranks and overall empathic nature relative to da nad kin, Grak was selected to leave Darili Irid for the Athenaeum of Barriers with the plan that da would return and become the next master warder of the clanhome. Upon returning home, da was entered into a rare arranged pair-bond with another dwarf, and fled from Darili Irid after refusing the Kiss on da nad bond night. Da has spent da nad time looking to make amends for the damage da nad absence caused to da nad clan.

I opened my eyes and looked at Grak. “Okay, first things first, what do ‘da’ and ‘da nad’ mean?”

“They’re part of the dwarven dialect used by my clan,” said Grak. “‘Da’ would be the equivalent of ‘he’ and ‘da nad’ would be the equivalent of ‘his’. It’s nothing that you couldn’t have known by other means.”

“Okay,” I said. “But the meaning is different, because you’re just assumed male for the sake of everyone’s convenience?”

Grak nodded. “Knowing that does not constitute proof.”

“Just curious,” I said. I took a breath. “Your clan comes from Darili Irid, which translates to something like Gold Hole. You were chosen to go to the Athenaeum of Barriers because you were skilled in the game of Ranks, and you came back to an arranged marriage that you ran away from with a refusal of something called the Kiss.”

Grak stared me in the eyes and I hoped that I hadn’t just made some extreme faux pas, or at least not one that was any bigger than reading from someone’s biography. “What else?” he asked.

“Nothing, that’s all I have,” I said. “Hopefully that’s enough.”

“It is,” nodded Grak.

“Alright!” said Fenn. “Then let’s get to looking at loot.” She held her hand out to the side and began dropping things onto the floor.
Friendship is Magic

We had to wake Amaryllis back up for a look at the loot, because the heirlooms were keyed to her, which meant that she was the one that could activate them or, alternately, use investiture to give them over to us.

“Rope first,” I said. “I want to see whether that’s Ropey.”

Fenn picked up the rope and dutifully handed it to Amaryllis, who handled it for a moment before it sprang to life in her hands. It dropped down and slithered over to the fireplace, where it rose up and contorted itself into different shapes. If I hadn’t been ready for it, I would have probably missed the first few, but this _was_ Ropey, and so I knew the shapes would be letters. H-E-L-L-O.

“It says ‘hello,’” I said. “Come here Ropey, do you want to be friends?” The rope dropped down to the floor in a heap and then slithered toward me, wrapping itself around my leg and then pulling itself up to chest level so I could pat it on the raised end that served as its head. “It’s a sentient length of rope,” I explained.

“The Eternal Golden Braid,” muttered Amaryllis from the couch. Apparently getting that fire going had been a poor choice, because she was very low on energy.

“Yeah,” I said, chuckling, “That was the name I gave it, but they called it Ropey. If I remember right it fell in love with a sentient magic sword shortly before that campaign was put on the shelf.”

“And what does it do, exactly?” asked Fenn.

“Oh, lots of stuff,” I said. “Reconnaissance, traps, climbing, all sorts of things. Whatever you would want to do with prehensile rope. I won’t have to boost you up over walls anymore, we can just throw Ropey up and have him tie himself into knots to give us something to grip onto.” I was really happy to see him, mostly because he was the most wholesome, loyal thing I had ever made. He was, if I’m being honest, mostly outclassed by what we already had, but he was still good to see.

Two more of the items were known, not to me, but to Amaryllis, at least well enough that she could give us a concrete description of what they did.

One was a throwing dagger, which had two distinct powers. The first was the ability to fly backward to the hand, similar to what Grak’s axe appeared to have, but fast enough that it stung the palm of my hand. The second ability was that if you hid it on your person, it would teleport around in order to stay hidden, so long as there was a place it could move to. This spoke to a level of intelligence and sensory capability that might have shocked me if we didn’t, you know, have 50 ft. of sentient rope. (The dagger was mine to keep, because I had a Thrown Weapons skill and was lacking for an off-hand weapon, not that I was going to attempt to Dual Wield with my bad hand.)

The second was leather armor, which had the effect of slowing and speeding the movements of the wearer, trading one for the other in short bursts. Fenn offered that she would take that one if I would agree to wear the other (still a mystery to us), and I decided that I was willing to roll the dice, mostly because I knew I had enough different combat abilities that I didn’t want yet another to think about while we were in the middle of a fight.

A third, which was a sickle with a rich oak handle, was Amaryllis’ alone, uninvestable, which seemed patently unfair because she already had a fancy sword. We had no idea what the sickle did, but she was only barely staying awake, so that would have to be tested later.
(A part of me was starting to see a self-destructive pattern with her, the other side of the coin from her being an indomitable, indestructible hellfire woman—teenage girl who would cut down anything in her path to get to her goal. It wasn’t just that she was strong, though she was, it was that she also had a need to be seen as strong. The house had been mildly chilly, in a way that was somewhat pleasant. No one had asked her to move a bunch of logs around and build a fire, she had done that because she had woken up and either consciously or subconsciously thought that she was being a useless burden and needed to either prove herself or provide forward momentum. Or maybe my INS wasn’t all that amazing at tearing apart a person’s motivations and it was a random fluctuation of the rat rot rather than being a deeply character-driven moment for her.)

That left a suit of armor, a bow, and a shortsword from the vault, plus everything we’d found on the corpses we’d collected from Trifles Tower, which amounted to a bracelet Aumann had been wearing, the necklace he wore under his suit, his pocketwatch, and a pair of glasses from the still mage.

I have to say, testing magic items was one of the highlights of my time in Aerb. There wasn’t any equivalent to the identify spell, but Grak could tell whether something had latent or passive magic just by looking at it with his warder’s monocle for a few minutes, and the study of magic was a natural outgrowth of specializing in countermagic. That was how we found the three magic items that Aumann had on his body. I made sure to have Fenn drop his body from the glove outside the house, so his blood would wash away in the rain.

There were, naturally, some things that we couldn’t test. We went outside with the weapons, but I was adamant that we not actually try to hit each other with them, not even with blows that weren’t supposed to hurt, because I wasn’t confident that a vorpal sword wouldn’t accidentally cut off someone’s head, or more realistically, that we’d find out the hard way that a sword left bleeding wounds that magical healing didn’t work on, or something ridiculous like that. It wasn’t entirely clear what the bounds of possibility were, as far as magic items went; six of the exclusion zones were caused by a magic item of one kind or another. The ones we were testing were either owned by Aumann and his people or recently acquired from one of the places known to Amaryllis, so they wouldn’t be that powerful, at least in the scheme of things … but that didn’t help us all that much, because the possibilities were still massive.

Still, the end result was some good, silly fun.

“Okay,” said Fenn. “The bow currently does nothing.” The bow in question had a grip that seemed to be made of sandstone, which let off a dusting of sand whenever it was fired but never actually got any slimmer. The wood that made up its limbs was light and honey-colored, but pretty wasn’t really the criteria we were looking for. “So here’s what I’m thinking, it’s probably keyed to a word of power.” She held up the bow and aimed across the grass toward where she’d set up targets on top of a dresser. The dresser had come from her glove, and I was fairly sure that she had stolen it from our hotel room. “Gambagulon!” she said, and fired an arrow from the bow.

“Does that mean anything?” I asked with a laugh. “Were you hoping that elf luck would let you randomly pick the right word out of every possible word in the world?”

“Wouldn’t be the weirdest thing to happen to me in the last week,” said Fenn with a cheery smile. “Okay, give me some Earth words.”

“We share the same language,” I replied. “The only differences are in terms of references, idioms, and things like that, and more than half those just have a different origin on Aerb instead of being incomprehensible.”

“Fine,” said Fenn, “Just give me your most stereotypical word of power in Earth English, ours would
be something like shouting ‘Abracadabra!’"

“That … is the same as on Earth,” I said.

“Bullshit,” said Fenn. “You have the same story?”

“No,” I said. “It’s just something that people say when they do magic. But we don’t have magic, so it’s something that they say when they pretend to do magic, I guess.” I paused. “What does it mean here?”

“Classical play,” said Fenn. “Supposedly based on real life, but it would have been centuries ago, before the Lost King’s time, if that’s what you’re thinking. There’s a king and his wizardly advisor, who is secretly a traitor, but the king secretly knows that his advisor is traitor, and the wizard is a bit incompetent, so most of what makes it funny is that the wizard is doing all these underhanded things that the king has perfectly predicted. Anyway, it builds up to a climax as the wizard finds this word of power in a book somewhere that will surely destroy the king. One guess as to what the word is, which is revealed when he finally says it to the king’s face. And of course the king already knew about this book, he was the one who had planted it in the first place, so the audience is laughing hard at the fact that the wizard is always playing a level below his opponent. ‘Abracadabra’ is therefore nonsense.”

“Huh,” I said. Sounds like a clue.

“You know,” said Fenn, “Not everything is a clue.”

“I didn’t say it was a clue,” I replied. “You just inferred that from my expression.”

“Well, not everything is a clue,” said Fenn. “I know you’ve got your magical powers and everything, but we’re going to go crazy if we start down that road. More specifically, I am going to go crazy.”

“The glasses shroud people in an aura,” said Grak, who had been sitting at the large table outside the house looking over the other items. “You’re both tinted purple. The entad goes from latent to passive with a tap at the sides. It’s unclear, as yet, what the color signifies.”

“Hrm,” I said. “Is it blocked by line of sight?”

“Yes,” said Grak. He looked at the bow in Fenn’s hand. “Any luck with your own?”

I had put on the armor, a metallic-blue outfit that seemed to display as much variety of craftsmanship as possible, with a large, solid breastplate, scaled armor on the sides and upper arms, then chainmail at the extremities, with leather and cloth underneath. It fit me perfectly, which wasn’t terribly much of a surprise, since that was a standard rule we’d always used. Though I hadn’t been watching her change into it, I was fairly sure that the same on-the-sly magical resizing had happened when Amaryllis had donned the immobility plate, because the thought of that vault having plate specifically sized to a small teenage girl beggared belief (at the time, I hadn’t even questioned it).

I’d moved around in it and tried to get a hint of what magic it might have, turning a somersault and sprinting across the grass, then doing a few drills with the Anyblade, but I’d gone over to see what Fenn was doing fairly quickly.

I knew from Grak’s question that what he was really asking was, ‘Are you two done fucking around?’, which, from an outsider’s perspective, was fair. But it still seemed unfair to me, because it hadn’t been more than a few hours since we’d killed six people, and if I wanted to take my mind off that by having fun with Fenn, then that seemed like a worthwhile use of my time. I didn’t want to
think about the adrenaline thrill of moving to kill someone, the copper taste of blood in the air, the messy way that blood had poured from Aumann when he had a hole punched through his head, the way I felt like I was pushing myself to have remorse and regret that I didn’t actually feel -- I didn’t want to think about any of that, and this was a way for me to do that, so in one sense Grak was justified in not-so-subtly telling us that we were off focus, but in another sense, I was upset with him.

“Nothing yet,” I said. “You thought this armor had both passive and latent abilities?”

Grak nodded, and part of his frown softened. “That says nothing concrete. Resizing is latent, unless it’s in the process of happening. If the armor is lighter, or more breathable, that accounts for its passive magic. It’s common on entads and heirloom entads, part of the way the forge frenzy usually takes shape.”

“But it’s not likely to just be a really good suit of armor,” I said.

“No,” replied Grak. He turned to Fenn. “And you?”

“Look, you’re not our taskmaster,” said Fenn. “If anyone is the taskmaster, it’s Mary, and then only because she’s got seniority. We haven’t arranged for whom the backup taskmaster is, in event of illness or absence, but I personally was eyeing that position —”

“Elf humor,” said Grak, dismissively. “This is important. If we want to succeed at our joint goals, we need unanimity of purpose.”

“Sure, sure,” said Fenn. “Doesn’t mean that we can’t have a little bit of fun from time to time. I’ll have you know that I am our team comic relief, Joon tried out for the position but couldn’t hold a candle to me.”

“If there’s a method of physical activation, it will likely be in the grip,” said Grak. He pointed to the sandstone. “The material is a special one, not normally used in a bow, and it provides a magical effect when touched.”

“Well I’ve tried that,” said Fenn. “I tried rubbing it, licking it, eating some of the sand, blowing the sand out of the palm of my hand, touching an arrowhead to the sand, a number of different ways of holding it, and nothing that I tried worked.” I wasn’t entirely sure how serious she was about having eaten sand.

“Did you try twisting it?” I asked.

Fenn glared at me. “Of course I did,” she replied. She held the sandstone grip in her hand and twisted her hand, which rotated the bow.

“No, I meant,” I paused, thinking of how to phrase it. “Use both hands, like you’re trying to hold the limbs still and rotate the central part of it.”

Fenn did, and that worked, which only deepened her glare. “Stupid bullshit game powers,” she said.

“Sometimes things work like I think they should work,” I said to Grak. He didn’t seem to know how to take that, but his attention was turned back to Fenn a moment later, as she fired the bow.

The arrow hung in the air, a foot away from the bow.

“Huh,” said Fenn. “And now, we wait.”

So we waited. I had a count going in my head, using the mississippi method, and around ‘fifteen
mississippi’ my attention was starting to wane. I began wondering what word they used on Aerb to count off seconds, and whether their second was exactly the same as an Earth second or just close enough that it didn’t make a difference in casual conversation, and it wasn’t exactly like I had a way to check.

“You may need to do something to get it moving again,” Grak began, but then we hit thirty mississippi and the arrow zipped through the air, striking the bar of soap that had been set up on the dresser.

“Thirty seconds,” Fenn and I both said in tandem.

“It needs a name,” said Fenn. “But I’m going to have to work on tactics some, and, oh, wait,” she pulled an arrow out of Sable and fired it, lodging it in place in mid-air, then another, then another, until a full ten of them were hung there, side by side. By the time she’d fired the last one, the first one began moving again, flying toward the air to its target. “Okay, good, no limits on that. Should be able to set up an ambush or distraction with it. That will have to play into the naming decision.”

“You should conserve your arrows,” said Grak.

Fenn held up her glove. “Do you want to guess, perchance, how many arrows are contained within easy reach?” Grak frowned. “I’ll save you the suspense, it’s two thousand. If I run out of arrows, we are probably entirely fucked.” She turned to me. “You’ve still got work to do on figuring out that armor, yes? I was going to check in on our princess.”

“Yes,” I said. Probably good to give those two a break from each other anyway.

As Fenn stalked off, I watched the sway of her hips, which I was pretty sure she was exaggerating for my benefit. She’d said she would stop flirting with me and respect my cultural norms, which she had mostly done, but there were occasional times, as now, when it seemed like she was prodding at the boundaries we’d set.

I realized with a start that Grak was standing next to me. He was examining my armor. “When I left my clan to learn at the Athenaeum of Barriers, it was like being put into another world. It was strange and unsettling.”

“I can see the parallels,” I said cautiously.

“I made two friends in the first week. The three of us were inseparable.” Grak took off the magical glasses, folded them and put them in a pocket, then took out his monocle to inspect my armor. “There is a feature shared by most of the mortal species called propinquity. We bond because we spend time with one another. It’s the same for dwarves, elves, and humans. If we all spend time together I expect that we will become friends, despite our differences in species, outlook, personality, and humor. We start to like people for no other reason than because we’re around them.”

I had the sense that Grak was building to something, but I couldn’t tell exactly what. This was the longest he’d spoken to me in the time we’d known each other. There was something I couldn’t place about the way he talked, not just a noticeable accent with what I thought was a more than usual emphasis on some of the vowel sounds, but in his cadence, which gave the end of every sentence a sense of finality. But for all that, he kept looking at my armor and stayed silent for long enough that it seemed like he was over.

“Well, I hope that we become friends,” I ventured.

Grak sniffed and put his monocle away, then looked me in the eye, which was somewhat awkward
given our height difference. “I made the mistake of having experimental coitus with one of them,” he said. “Neither remained a friend for long after that.”

“Oh,” I said. “I see.” Though the phrase ‘experimental coitus’ was extremely confusing and unsettling, and I vowed to go grab my copy of The Book of Blood from Fenn as soon as possible to check in on some anatomical facts.

Grak breathed a sigh and some tension drained from him. “Thank you,” he said. “This is the sort of conversation I avoid if I can. I didn’t mean to be rude.” He gave the armor a poke, hard enough to almost knock me off balance, but the armor stubbornly refused to do anything noteworthy.

“No,” I said, “You were right that we need to get moving sooner rather than later, and as far as the, uh, interpersonal stuff goes, that’s … a reasonable caution.”

Grak held his hand out to the side and his axe came sailing over from where it had been sitting on the table to land in his hand. “I’m going to hit you now,” he said.

I braced for the impact of his axe, and listened to the sound of it swinging through the air, but it failed to connect. I was pretty sure that I needed more than 18 Dodge to completely avoid a hit while standing still. I looked down at my armor, which was now sporting a white line of discoloration across the bottom of its metallic-blue breastplate.

“It passed through,” said Grak. “It wasn’t a hard enough strike to seriously hurt you either way.” He popped his monocle back in and took a few moments to look at the armor. “That should fade,” he said finally, giving the white mark a poke. “My guess is that the armor allows a strike to pass through you but not in the same place twice. We should wait to see how slow the line fades.”

I looked down at my armor and traced a finger over the white line. That seemed like an amazing increase to my survivability, especially since it meant that shooting me was no longer as much of an option, at least if the protection extended down to where the chainmail covered my calves and forearms. The suit hadn’t come with a helmet, boots, or gloves, so I was standing there in a pair of sneakers that clonal kit had made me. I was pretty sure that I looked like a dork, but that didn’t matter, because I was giddy at the thought of actually wearing magic armor.

“She wants us to kill a unicorn,” said Fenn as soon as we came back into the main room. Her hands were folded over her chest. Amaryllis was sitting up again, no longer asleep.

**Quest Accepted: Unihorn - Travel to the Aon Adharc Glen and kill a unicorn, then allow Amaryllis to drink from its healing blood.**

Amaryllis gave a wet cough. “Remind me never to talk to you in confidence,” she said.

“There are unicorns,” I said flatly, “Because of course there are. And killing one is unimaginably evil, I assume?”

“Why would you assume that?” asked Fenn. “Unicorns are fucking dicks. Are there opposite unicorns on Airth, ones that don’t steal little girls and gore people in the chest?”

“Oh, those unicorns,” I said, “At first I thought you were talking about a different kind of unicorn.” And though I was saying a bit sarcastically, it actually was true, because I remembered exactly the unicorns that she was talking about; I had made them for Tiff.

“I’m not saying that D&D is sexist,” said Tiff with a roll of her eyes. “I mean, the core rulebooks
from third edition on aren’t any more sexist than your average Hollywood action movie, it’s just stuff like women in sexy armor and men in functional plate, or the way the portraits are posed, but it’s mostly genderless and it is making an effort on that front. The problem is that the default assumption D&D uses is of this mostly Middle Ages world that draws on the actual Middle Ages, and both the books and the players are usually going to whitewash that by pretending that the Middle Ages were a time of racial and sexual equality, except that there’s still all this other stuff leftover from the Middle Ages and mythology that will always keep creeping in.”

Tiff was a voracious reader, which wasn’t unusual among our group, but her tastes turned more to non-fiction than was the norm, and she once told me that she read about three words of analysis and commentary to every one word of actual fiction. She said reading what other people thought about the things she’d read or watched was her version of girly gossip, and I took that at face value for quite a while before I realized that she was being a bit impish.

“So there are some monsters that you don’t want to be fighting?” I asked.

“No, no,” said Tiff. Her ponytail had a way of swishing side to side when she shook her head that brought a smile to my face. “I’m saying that, like, the Monster Manual has hags and succubi, right? And I just don’t want them dropped into the game as that, as these unexamined representations of the fucked up way that the Middle Ages thought about women. If we’re going to face them, then I want them to be considered representations.”

“Ugh, Jesus, please no,” said Reimer. “Please don’t ask Juniper to get fancy. You weren’t here for when we played Long Stairs, it was supposed to be this neat little dungeon crawl thing where we were army guys going into an endless fantasy dungeon in Oregon, but we just got constantly bogged down in these moral dilemmas and parallels to American imperial jingoism in the Middle East, or something.”

“It was great,” said Arthur. “Third best campaign we ever played.”

Tiff looked to me. “I wouldn’t mind trying that out sometime,” she said. “Sounds neat.”

“It ran its course,” I replied. And maybe it wouldn’t have, if I had gone with the simpler version of marines using machine guns against fantasy creatures, but there was only so much that you could do with the ‘are we the baddies’ schtick. “Sorry you weren’t around for it.”

“Don’t feel bad,” said Craig. “They talk about the Cranberry Guilds constantly, eventually we’ll just drown out the old campaigns with new ones.”

“Yeah,” said Tiff. “I’m down with that.”

Tiff was still pretty new to the group at that point, and while she’d been enjoying herself, that was the first time she really seemed like she was going to be a permanent fixture. So of course I made a unicorn just for her, a majestic, terrifying beast that was obsessed with virginal purity in the way I suspected a medieval man might be.

“Is there a place you would expect to find a unicorn?” asked Grak. “Is there one we can access from a discreet teleportation?”

“Aon Adharc Glen,” I said. Everyone looked at me. “Got a quest for it just now. Sorry, spoilers. Amaryllis, can you give us the pitch?” She looked tired, and I immediately regretted putting that onus on her. “I’m in, by the way, since I’ve got a quest for it.”

“Can I say that unicorns are fucking dangerous?” asked Fenn. She had her arms crossed over her
chest. “We just fought and killed a gold mage, something we only managed to do because we had,” she glanced at me, “A very lucky combination of circumstance and coincidence, one which I don’t really want to rely on again. We had basically no way to hurt Aumann beside the void rifle, and we had no way to permanently kill his revision mage besides Mary’s sword.”

“So logically, the handful of items we just got will be exactly those that will allow us to kill the unicorn,” I said with a cheerful smile. “Or we’ll pick up the requisite ones along the way, or something.”

“If that’s the plan then I will vote against it,” said Grak.

“I’m halfway kidding,” I said.

“My right arm is almost useless for anything besides using a rifle,” said Amaryllis. “The spread of the disease has quickened. I would guess that at best, we have another ten days until it reaches my brain and does damage that will be much harder to reverse, if it hasn’t already. When I was under Aumann’s care, I convinced him that whatever else his intentions with me, I was worth more alive than dead. Some avenues of healing have already been tried, blood and bone magic among them. It’s an obscure disease with a remote origin, and it’s entirely possible that it’s magical in nature, given how it was contracted. The name ‘rat rot’ doesn’t appear in any book. Some of this information I have by way of Aumann, so it’s suspect, but I do think that he would have healed me if he could have, purely for his own self-interest.”

Fenn nodded along, twirling her fingers in the universal sign for ‘hurry it up’.

“We do have other options,” said Amaryllis. “They will cost us time, but might be worth trying. And here I’d go on about those options for a bit, but you already know what my conclusion is. Unicorns provide an absolute cure to disease, which makes them almost unique in that regard.” She glanced at me. *And I got out of rat rot with a level up.* “When I was eight years old, I met a unicorn at Aon Adharc Glen, far in the northern reaches of Parasteur, while my mother was on a mission of diplomacy. It killed my handmaid and my two guards before taking me for its own. Three days later, I, along with four other girls it had taken, was rescued in an operation that killed three of the ten men that were sent after me.”

“So what you’re saying is that it’s really, really dangerous,” said Fenn with a nod.

“The team was hastily assembled and without critical information,” said Amaryllis. “There were a few scholarly books written based on interviews with the survivors. That information is one of our two advantages. The other advantage is that we have me. I was taken by it, and it should want me back.”

Fenn cast a critical eye over Amaryllis. “No offense,” she started, “But I’m not sure what the unicorn would see in you.”

“I’m a virginal girl before her eighteenth birthday,” said Amaryllis. “Not only that, but it has known me before, which should make me more attractive to it.” She looked down at her arm. “I am well aware of the state I’m in, thank you.”

“I didn’t mean it like that,” said Fenn. “I said no offense!”

“I’m still in, but I want go information gathering first, to see if there’s an easier way,” I said. “I think we can afford to spend a day on that.”

“I don’t know what doors Aumann knocked on,” said Amaryllis. “I don’t know whether he was in
contact with my family, though I wouldn’t be surprised. I was interrogated, I know that much, but there were a few things that I decided beforehand I would put my effort into keeping quiet, things like this place, like Juniper, and the disease was not one of them. One of the benefits of luring and killing the Aon Adharc unicorn is that it doesn’t require us to go down any avenues that might have been poisoned against us.”

“I have my own condition to think about,” I said. “That’s going to take research anyway, and we might as well kill two birds with one stone. Aside from you, we’re all complete unknowns, there shouldn’t be much risk in asking questions.”

“You don’t know my family,” said Amaryllis.

“Well, that’s my condition, information first, unicorn murder second,” said Fenn. She uncrossed her arms and stretched out, moving around in her still-unfamiliar armor. “Actually, scratch that, I have lots of conditions. If Juniper just leveled up that means that we need to get him training, sooner rather than later, so he can reach his caps before we get to this unicorn business.”

“I don’t think that’s going to happen,” I said. I almost told them that I had nine points to spend, not just the two that they would naturally assume, but held back, mostly because I didn’t want their advice (and already knew what it would be). “Training up is getting more time intensive as we go on. Getting any individual skill to twenty is going to take at least a day, I think, and there are lots of skills to worry about.”

“Then at least get started,” said Fenn. “But I’ve said that I’m grudgingly in, so long as we can talk to some people first. Teleporting in anywhere is dangerous, I get that, we can’t let anyone see us appear from thin air holding a teleportation key, and then we’re stuck for two hours before we can leave again, but it’s a unicorn, killing one is a feat reserved for elven elders, and I’m going to look for my outs.” She turned to Grak. “Does Grak get a vote? Are we a democracy?”

“I vote in favor,” said Grak, “I agree with your assessment of Aumann and his incentives, you would have been a windfall to him. He would have spent a considerable sum to make you well. I also agree with Fenn, we should try to see whether there is a way to solve this problem with only our funds.”

And I hadn’t really had any doubt about how that was going to go, because I had a quest all lined up for it.
In Which Juniper Stares At His Character Sheet

While Fenn and Grak continued magic item testing, I stared at my character sheet and tried to determine how I was going to spend my points.

What do you want to be when you grow up?

Well, no, that was the wrong question. The real question was the proper way to minmax, given the information I had available to me. Skills had both primary and secondary abilities associated with them, which probably helped to define success and failure in accordance with some hidden rules that I wasn’t privy to. My guess was that chance to Dodge was something like the roll of a die plus skill in Dodge multiplied by the primary stat and also half the secondary stat, but none of that was exposed to me and it seemed like it would be really hard to test, especially if (as I suspected) the rules changed depending on whether I was in combat or not.

One of the core concepts of D&D character optimization was avoiding MAD, multiple ability dependence. The general idea was that if your character could be boiled down to a single ability score, then you could focus all of your various resources on raising that ability, which would make you superior to the guy who spread his resources thinner. This was in part due to how the math and mechanics of D&D worked out; the game made it harder to just infinitely stack bonuses on a single ability in order to combat that hyperspecialization, but it was still one of the best general optimization strategies.

Because there were both primary and secondary abilities for every skill, it was impossible to go truly single ability, because eventually you’d hit the cap on the skill’s secondary ability. However, there were different ways to divide up the various skills:

1. Skills which have both primary and secondary in the same superclass of either PHY, MEN, or SOC. Those skills can have their cap raised by just putting the points into the superclass ability, which gives a 2:3 payout. (e.g. if One-Handed Weapons has POW and SPD as primary and secondary respectively, and I was only concerned with raising that skill, then I would put points into PHY when the skill was capped on SPD (putting them into POW when it was capped on POW) and attempt to maintain a 5:3 ratio between POW and SPD. If I had done that from the start, then using my lifetime 23 points at level 10 I would have 11 PHY, 17 POW, 10 SPD, and 10 END to show for it, with a cap of 50 on One-Handed Weapons. Going pure PHY instead would result in 14 PHY and 13 for each child stat, with a point left over, resulting in a cap of 39, for a better generalist approach but weaker specialist one.)
2. Skills which have their primary and secondary split between superclasses. This meant that I’d either be pushing points into the superclass abilities on both sides, or I would be “wasting” points on putting them into the specific abilities. (e.g. Parry had SPD as primary and INS as secondary. Going for that skill, and only that skill, the specialist approach would have given me 17 SPD and 10 INS with a cap of 50, but not much else to show for it. The generalist approach would have left me with a 9 in all PHY stats and a 6 in all SOC stats, for a cap of 27 in all skills that didn’t need SOC stats.)
3. Skills that depended on other skills. So far, I only knew of one of those, which was Skin Magic, which required Art to make the tattoos. Skin Magic encompassed more than just the tattoos, since there was apparently scar magic as well, but for all intents and purposes if I wanted to pursue Skin Magic to the exclusion of all other skills, I might be faced with having to raise four different abilities, two each from each of the skills, which could get really complicated depending on which abilities there were and was probably worth avoiding at all costs.
So logically, in order to minmax, I should focus exclusively on those skills that were confined to within a single superclass, which meant that my decision was basically down to three choices, and SOC was a bit of a non-starter, which meant that it came down to either PHY or MEN.

The problem was, the mental stats seemed to be linked mostly to magic, and all the magic I knew sucked. Well, ‘sucked’ was a strong word, but it was blood, bone, skin, and gem magic. Skin magic was the definition of MAD, blood magic was ‘hidden’ MAD because it was mostly a melee-combat oriented magic, bone magic needed a constant supply of bones to drain, and gem magic was not only limited by expensive gems, but also drained mental energy. And worse, I didn’t actually know the secondary abilities for any of those, so they might not even have benefitted from going the superclass ability route (my strongest candidate for Blood Magic’s secondary was END rather than CUN or KNO).

But generally speaking, the conventional wisdom in-universe was that magic was the foundation of civilization and progress. From what I knew of how fights went, there were a variety of mages that you couldn’t go toe-to-toe with in single combat unless you were lucky or smart, and you couldn’t be lucky or smart without diverting points from PHY. With (perhaps) the exception of survivability, MEN seemed like the winner, especially in the long term.

I guess I was also leery of the mental stats for another reason, and that reason was Tom.

The party had been stuck on a puzzle for quite some time, but at least they were working together to figure it out rather than getting bored or frustrated. The puzzle took the form of blocks with lines on top of them, arranged in a particular way and responsive to the touch with displays of lights. There was an underlying, discoverable set of rules that governed the patterns of lights, which they’d slowly figured out and written down, but after that it was a case of beating the puzzle using those rules against an adversarial intelligence. It was, in essence, a boardgame, one that I had developed and then practiced until I was good at it. I had the advantage of that practice, and of not having to discover the rules, but I was pretty sure that I was going to lose, because it was five brains against one.

“Can I roll Intelligence to figure out our next move?” asked Tom. He was playing a gnomish wizard with 22 INT; 18 INT was supposed to be where intelligence maxed out for a human, though that sort of depended on edition. Tom was a great guy, very understanding and funny, but he wasn’t really a thinker, and certainly not on par with his character.

“Eh, no,” I said. “Maybe we’ll do that if you guys can’t beat it on your own.”

Tom shook his fist at the heavens. “Curse my useless gigantic brain!”

“You kind of have to roll with it,” said Craig. “Pun not intended. I mean realistically you’d figure out how to beat the puzzle right away, because you’re going up against Joon, who is decidedly not at 22 INT.”

“Hey,” I said. I mean, it was true, but you don’t just let stuff like that go unchallenged.

“I’m in class with you, you’re like a 15 at best,” said Craig. He held up a finger. “Which is still really good, that’s like a standard deviation above normal.”

“No, it’s not,” said Reimer. “Average for 3d6 is 10.5 with a standard deviation of 3, but that’s for adventurers, not commoners, and if you used 3d6 for commoners you’d get absurd results like one in every 216 people having an IQ of like 145, which is three standard deviations above normal.”
“I didn’t mean literally,” said Craig with a wave of his hand.

“You meant that 15 was figuratively a standard deviation above normal?” asked Reimer. “Do you not know the difference between figurative and literal?”

“We’re saying that Joon would hypothetically have an IQ of 130,” Arthur cut in, “Which would put him in the top 3% of people, or something like that. That doesn’t actually seem that unrealistic to me, there are about 150 people in our class, so he’d be in the top five or six? But the point is that Tom is playing a character who would have an IQ of 160, which would make him Stephen Hawking or Albert Einstein, and while you could fake being as smart as them, in order to come up with the same things that they came up with in the same amount of time, you’d have to actually be as smart as them. Tom could never come up with general relativity just by pretending to be Einstein.”

“Okay,” I said, “But I don’t want to give you a riddle and have you roll some dice and then I tell you the answer to the riddle. That’s lame.”

“I agree,” said Arthur with a shrug. “But it seems like you have to cheat at some point, because you aren’t Stephen Hawking and neither is Tom.”

We never really did figure out a good solution to that problem, which was present not just for intelligence but for other aspects as well. It was a bit easier for wisdom and charisma, but the problem was still there, and Reimer got some painful comeuppance when he tried to play the most charismatic bard in the world and then kept sticking his foot in his mouth.

I was worried on two fronts.

First, while it was clear that the game was actually changing things in my head, I wasn’t exactly clear on the nature of how that was working. Building the rocket had been the most intellectually challenging thing that I had done, and the feeling had been one of practiced ease, like I was used to dealing with those kinds of problems. You know how you do something enough times and it just becomes automatic? That happened with muscle memory, but it also happened with other brain functions, and that’s what engineering was like for me. And how was that happening? Was the game just inserting thoughts into my head in some kind of man-in-the-middle assistance? Or was it actually changing the structure of my mind? Would making myself ‘smarter’ or ‘more knowledgeable’ actually do those things, or would it just increase the frequency and severity of thoughts being forced into my brain by the game? (It probably goes without saying that giving more of my thought processes over to the not-quite-unmalicious game was likely a bad thing.)

And second, it was clear that the game was actually changing things in my head. I’d already put points into MEN (and a lesser extent SOC) but still felt like myself. Radically changing my personality wasn’t really something that I was up for, and that seemed like the end result of radically increasing my cunning, knowledge, and wisdom. It was hard to believe that the Juniper that went into the process would resemble the one that came out the other end. I had already started that process and didn’t really feel that much different, but taking the larger leap was frightening, no matter which way the changes were implemented.

So I was cautious. I made a list of problems or questions which I didn’t know how to solve or answer, some of them within the skill domains and some not, trying to spread them around as many different areas of mental faculty as possible, and then including some social and physical problems as well to make sure that I could identify whether there was any spillover. (I would have liked to take some standardized tests, but I couldn’t get the clonal kit to make one for me, let alone two comparable-but-nonidentical ones that I could use as control and experiment.) Here’s a sample of some of the questions:
What is Tsiolkovsky’s rocket equation? (KNO)
How do you always win at tic-tac-toe assuming you start first? (CUN)
What governs the numbers behind hp increase? (CUN)
What governs the numbers behind mental exhaustion? (CUN)
Does Amaryllis feel any actual affection for me? (INS)
What should I spend my points on? (???)
How do I pull social attributes from bones? (Bone Magic, KNO)
What film won the Oscar for Best Picture in 1994? (KNO)

Of course, I was just guessing about what might govern those, and I had no real idea how easy or difficult of problems they might be, but I did want a baseline. The list went on for a page and a half, which was helpful to clarify some things for me, even if it might end up being useless.

And with that I stopped dawdling, closed my eyes, and put the first two points into MEN, which increased all of my mental stats by one each. And then I opened my eyes, because part of the experimental procedure I’d designed included doing things in steps as much as possible.

Nothing really seemed all that different to me. I didn’t feel smarter. Then again, I wasn’t really sure whether people ever felt smarter or dumber, even when they were smarter or dumber due to things like lack of sleep, drug use, nootropics, etc. They might recognize some difficulty or ease with problems they were facing, but absent those problems intellect wasn’t something you felt. I did, maybe, feel a little less emotional, which I might have chalked up to WIS, but it might have also been the relief of having set down this path and not immediately been faced with the existential horror of a changed personality at the first step. So I looked down at my sheet of questions.

And yes, some of them I could solve or answer, which I had worked at before and not gotten.

The four values I had seen for hitpoint maximum were 4, 8, 27, and 36. There was a fairly substantial gap between the 8 and 27 observations, which I would have had data for if I had been looking at my health bar when I’d first started bleeding out in the sewers of Silmar City. If hit points were derived from a single attribute, and that attribute was END, then 1=4, 2=8, 3=?, 4=?, 5=27, 6=36, 7=?.

The big clue was that neither increase was prime, and after doing prime factorization, the pattern became 2*2, 2*2*2, ?, ?, 3*3*3, 2*3*3*2, or alternately, 1*2*2, 2*2*2, ?, ?, 3*3*3, 3*3*4, which would put the missing ones as being 2*2*3 and 2*3*3. There were three numbers that incremented one by one until repeating the process. There were other possibilities, but that was the most simple one, and it gave me several testable predictions. The next increase to END would give me a hitpoint maximum of 3*4*4, or 48, and the missing values, which I’d see if I suffered some gruesome fate that once again left me bleeding out, would be 12 and 18.

Mental exhaustion had gone from being out of 12 to being out of 20, which meant that it was following a different trajectory, and one that I couldn’t predict at all with only two data points, even if I could correlate those to my WIS stat. The likely candidate, given what I thought I had figured out about the END to hitpoint connection, was that it was on a similar multiplicative track; 4=12, 5=20, or 4=2*2*3, 5=2*2*5, meaning that the next in the sequence might be either 5*6 (30) or 2*2*7 (28) (among lots of other possibilities). The former was more likely, given that I didn’t expect the curve to be linear, but it was inconclusive. Fortunately, I had seven ability points left, which meant that I could get more data in short order.

First though, I looked at the most-important-for-now question, which was “What should I spend my points on?” The only new insight I had was that I was capped at 18 for ten different skills, all of which could be raised by just two points into PHY, and while that was a short-term investment, it
was a short-term investment that I might need if we were going to be fighting this unicorn, or if I got into any fights along the way. I had raised sixteen skills above 10 and gotten new (minor) Virtues seven times, plus I had unlocked a bunch of stuff for Bone Magic at 10, which kind of counted. And if I were designing a game, then the stuff that didn’t get a virtue at 10 would get one at 20, and “if I were designing the game” still seemed like a good heuristic.

I closed my eyes and put another two points into MEN, then opened my eyes and looked at the sheet in front of me. The mental exhaustion meter went from 20 to 30, which meant that it was probably in the form of (WIS * (WIS - 1)), or maybe just “the increase will increase by two each time”.

But again, I didn’t feel smarter, or wiser, or more knowledgeable. It just felt like there were things I hadn’t spent the time to figure out, or that I had missed for some reason. Like:

“♬ Blackbird singing in the dead of night, take these broken wings and learn to fly. ♬”

**Skill Unlocked: Music!**

I had a book of plays, stories, music, and poetry written by Uther Penndraig, and I had the Art skill, but I just hadn’t thought to try singing to see whether I had gotten a skill unlock. I couldn’t really see how music would be useful, unless it was tied to some magic in a way that I didn’t understand, but once I thought about music it was obvious in retrospect that it was something that I should at least try, even if it was only to fill in the character sheet more. And not only was it a skill that I could probably increase relatively passively by singing a lot while I did other things, there might be virtues to be unlocked that could have benefits not related to music.

I tried poetry too:

*There once was a boy from Kans-ass,*
*Who sat in his Eng-a-lish class,*
*He came to on a plane,*
*With no time to explain,*
*’fore he was tossed out on his ass*

But the game didn’t seem to think this bit of doggerel was worth commenting on, not even to give me a message about **Critical Failure!**

So after reviewing my questions again and finding nothing really worthy of note, I closed my eyes and put another two points into MEN, increasing my mental stats by one yet again.

**WARNING: COGNITIVE ENHANCEMENT HAS CAUSED PERSONALITY NETWORK TO EXCEED HOLISTIC INTEGRITY THRESHOLDS. REVERSING AND REFACTORIZATION EMULATION TO WITHIN HOLISTIC INTEGRITY THRESHOLDS. ENABLING TRI-STRATUM PSEUDO-INTELLIGENCE INJECTION SETTING TO COMPENSATE.**

The words blasted across my field of vision as soon as I opened my eyes, bright red, all caps, and in a different font. As soon as I had read them, the words disappeared, and I was left looking at the papers in front of me, not really seeing them.

“Well, fuck,” I said out loud. That was not the direction that I had expected a dose of existential horror to come from. I’d read through the Eclipse Phase sourcebook enough to know what was probably meant by emulation; it meant that my mind had been scanned or taken apart and was running on some non-brain substrate which was pretending to be my brain. If I was an emulation, then I wasn’t even at the level of a brain in a jar, I was a brain being simulated at some level of
fidelity on a computer somewhere, which meant that everything I had seen and experienced was probably also a simulation, or something like it.

And maybe it was the fact that I was at 7 WIS now, but I was freaking out about this less than I thought I would. It basically confirmed the simulation theory to me, but that wasn’t actually that surprising. It did explain how I had gone from fifth period English class to Aerb, at least in part. Someone had either scanned in my actual, real-world brain and then made a reconstruction of it on a computer, making some alterations that would give me anterograde amnesia, or maybe they’d constructed me from whole cloth, with no real Juniper Smith on Earth, and possibly no Earth at all.

For what purpose? That was impossible to say. Well, not impossible, because it was a problem with some bounds, but those bounds were huge. Who or what had put me here? Well, it or they had some interest in me specifically, because this world had been created from my thoughts or memories beyond what the dream-skewered seemed to experience. And the message, about exceeding personality bounds, said that they had put in bounds to keep me from becoming not-Juniper.

I had a name for the creator though, one I knew fit as soon as it passed through my mind: the Dungeon Master. I was playing his (or her, or their) game. I had been on the other end of building the worlds, characters, and plot enough times to understand the impulse, if not how or why you would do it like this, without consent or a safety net, besides maybe abject, hedonistic evil.

(There was still the faint possibility that the things I was presented with on the game layer, or this new layer above it, weren’t real, that they were just figments put in place by a unique magic for some reason, but that had become a lot less credible than it had been a few minutes ago, and it had never really been all that credible.)

And really, it didn’t change all that much. I still thought of Fenn and Amaryllis as real, maybe even more real than I’d thought of them before, because now it wouldn’t be that I was real and they were fake, it would be that we were both fake, or maybe just different levels of fake, or the concept of real and fake wasn’t terribly meaningful. Maybe one or both of them had been created to suit me, or to manipulate me by the unseen DM, but that just made them victims. I wasn’t going to pull a Thomas Covenant or anything. The game had given me a warning in the settings screen that if I died I was dead for good. I hadn’t had reason to doubt that.

And Arthur. I was more convinced than ever that he’d been here, on Aerb, somehow, and that if there was ever an end to any of this, if it wasn’t just endless adventuring and leveling up with new companions and better equipment, then the end was going to come when I found the Lost King.

I stood up, feeling like I wanted to go somewhere and do something. I had little doubt that the Dungeon Master had root access to my mind, the ability to wipe away memories or change thoughts. It had been done to me by revision magic, after all, and if it was possible within Aerb then it was possible for whoever controlled the emulation of my mind or the false reality. I hadn’t just caught a glimpse of the layer above the game, I had been allowed to catch that glimpse. It hadn’t been reversed or wiped away. (If there was a message there, I didn’t understand it.)

But the world had rules, and it wasn’t willing to break those rules, or at least it hadn’t shown that it was willing to break them yet. When a person did something, there was a plausible reason for it. Factions and people were driven into conflict by their beliefs and values, not just ‘good’ and ‘evil’. Fenn was Fenn, she wasn’t someone who shifted and twisted to the whims of the game. Even if we had both questioned what the Loyalty number meant, and what impact it might have on her, our growing closeness didn’t seem like it was the work of an unseen Dungeon Master, it seemed like the natural result of our conversations, beliefs, and shared adversities.

“Alright,” I said to the air, keeping my voice low so no one could hear me unless they had a way of
monitoring my every word. Most likely, I didn’t even need to speak, because reading my thoughts surely couldn’t have been out of the Dungeon Master’s power, but it was a matter of ceremony. After a moment, I clasped my hands in prayer, which I hadn’t done in a long, long time. “You already know how I feel about God,” I said. “You probably scanned or created the memory of me attacking Victor Clark like a wild animal when he said that God works in mysterious ways.” That had been a week after Arthur died. “You’re inflicting pain on me when you could choose to do otherwise. You’ve made a world of suffering instead of joy. I never found a good argument that eliminated theodicy and I don’t expect that to change on Aerb. So, fuck you.”

I swallowed. “But until and unless I can actually do something about it, I’m not going to waste any more of my life raging against the heavens. I’m going to keep doing what I’ve been doing. I’m going to keep treating it as though it’s real, because you’ve put effort into making it real, the same kind of effort I like to think I always put into making my worlds real.” I hesitated, because I had no leverage, because I didn’t know what the DM wanted, so all I could do was tell him what I wanted and what I hoped for, which he probably already knew.

“I don’t want Fenn to change because her loyalty metric increased. I want her loyalty metric, if she’s going to have one, to just be a reflection of how loyal she is, not an invisible lever controlling her. I want her to be a real person, or at least as real as I am. And … I’m hesitant to want that for everyone else in Aerb, because sometimes existence is pain, but … if they’re not going to be real, or at least as real as I am, then I want them to be real enough that I can’t tell the difference. I want that for the whole of Aerb, alright? I want to poke at the seams and find out that you thought of everything. And at the end of it, I want Arthur back. That’s the only way that this game is ever going to be worth the candle.”

“Amen.”
It took me some time to collect myself. I ended up putting two points into PHY and another one point into LUK, a balancing of short term survival against long term gains. It was a choice I had made before getting that message from above the game layer, but I was even more certain about it afterward, because I was pretty sure “pseudo-intelligence” was the equivalent of having Tom rolling a Knowledge check because he couldn’t actually be as smart as his 22 INT wizard. PHY was, at present, the more valuable superstat, and it would allow me to reach level 20 on pretty much every skill I cared anything about. LUK was mostly because I had an odd number of points and would probably have to wait until level 20 until I got another odd point, and the time-value of points meant that probably didn't make sense, especially if LUK was properly balanced around not being able to get the 2:3 discount. Besides, there was no way to get a sense of how it actually worked or scaled without spending that first point. (The mental process of deciding these things also helped me to put all the existential stuff to one side, and I won't pretend that my decision was not, in part, influenced by the desire not to revisit the existentially tricky MEN stats.)

Grak and Fenn hadn’t had much luck with the rest of the magic items. Neither the necklace nor the bracelet seemed to do anything, though Fenn’s guess was that at least one of the two dealt with poisons in some regard, since that was one of the classical ways to kill a gold mage. The pocketwatch gave the Aerbian equivalent of latitude and longitude, which was a much simpler coordinate pair given that the world was flat, but much harder to determine given that the sun had the same apparent position no matter where on Aerb you were. The watch was therefore useful, but nothing to write home about. The armchair we hadn’t figured out either; I was suspicious that it was going to whisk us away to the bottom of a dungeon, because I’d once made an armchair that did that, but it did nothing when they sat in it and a dungeon chair seemed like an odd thing to keep in a vault.

I tried to feel engaged with their discoveries, but my sense of detachment wasn’t so easily cured, especially since the news was boring.

I spent some time training, after removing my armor to make sure that I wouldn’t accidentally use up more of its ability to make hits pass through me. I didn’t really want to train, but it was something that needed to be done, and sitting around reading or moping wasn’t going to improve my expected outcomes. I tried to make the training as intensive as possible, exercising as many skills as I could.

The end result of that was me dashing across the open clearing, trailing flames from my hands, singing Rick Astley’s ‘Never Gonna Give You Up’, while Fenn fired blunted arrows at me. Fenn had very quickly set up obstacles by dumping furniture out of her glove, and she’d put small targets up for me to strike with my sword. Grak stood at one end of the clearing, ready to spar with me when I looped back to him, and at the other end were a few melons I was supposed to strike unarmed.

I got sick about fifteen minutes in, but pushed through it as best I could for another few hours, until I felt like I was going to collapse. I had predicted that it would take me at least a day to get to 20 in any one of my skills, but it actually went quite a bit faster than that, and I think I knew why: the tooltip for CUN specifically said it was ‘used to … learn new things’, and it made sense that would have some real mechanical impact as far as what it took to increase skills.

Skill increased: Music lvl 6! (Skill capped at triple the value of primary stat CHA.)

Skill increased: One-Handed Weapons lvl 20! (Skill can no longer be increased by amateur training.)
New Virtue: Monkey Grip!

Skill increased: Dodge lvl 20! (Skill can no longer be increased by amateur training.)

New Virtue: Thaumic Dodger!

The two new virtues were relatively minor. ‘Monkey Grip’ was the ability to wield larger weapons through eliminating the penalty; I hadn’t known that there was a penalty, but holding a broadsword in one hand no longer felt awkward (the virtue had the same name as a feat Reimer used to love, which did the same thing). ‘Thaumic Dodger’ removed the supposed penalty involved with dodging magic. It seemed like the level 20 virtues were stronger, but they weren’t at the upper tiers of what I knew was physically possible on Aerb, and I was pretty sure that at some point they would allow things that were literally impossible for a mortal man, not just improbable or difficult.

Being capped at 20 because of how I was training was shockingly bad for me. It meant that I couldn’t just train up my Dodge skill against Fenn and hope that our Twinned Souls would allow her offensive power to keep pace so that she was a challenge. The word ‘amateur’ implied that a professional could still help me train, while the word ‘training’ implied that I could still get skills from actual combat, or maybe from other methods. I tried not to dwell on that too much, but it was bad news at a time when my morale was low.

We ate from the stockpiled food in the basement, simple fare with no cooking involved, and then the sun had set and it was time for bed, because we had a long day ahead of us. We each picked a room for ourselves, from the many there were available. Grak put up a detection ward at the main entrance that would wake him if any blood passed through it, and an anti-teleportation ward in the basement where there was the traditional gap in the house’s defenses. I used six of the Lecher’s Vines that I’d tattooed on myself, one at the entrance, another at the door to the teleportation room, and then one at each of our bedrooms. It seemed like overkill but it was also one of the only times that I was likely to use it.

It was good to have something to do, but then I was sitting in my room, not really tired but needing to sleep, and trying not to think too much about the nature of my reality. I was just starting to give in to the pointless desire to dwell on those things when there was a knock on my door. There was a bit of my brain that thought that was awfully convenient of the universe to provide me with a distraction right before I was going to think those deep thoughts, but I forced that bit down like one would force down bile after almost throwing up. Besides, I wanted a distraction. When I opened the door, Fenn was standing there, smiling.

“Got some time to talk?” asked Fenn.

“Yes, please,” I said.

She followed me, past the vines around the doorframe, which gave me a twinge of alert in the one leaf of a vine left tattooed on my arm. Fenn sat down on my bed and smoothed out the covers. She had changed out of her leather armor, and was in a tank top with plain, blue shorts, which had become her standard sleeping attire after she’d agreed to ‘respect my cultural norms’. It had been a long time since I had seen her naked, and I’ll admit that there was a part of me that had a twinge of annoyance at that.

“Grak told me not to fuck you,” said Fenn with a smile.

“Were those his exact words?” I asked.

“Oh, no, certainly not,” said Fenn. “For a traditional dwarf, maybe that would have been the
approach, but Grakhuil trained for like ten years to be a warder, which means that he’s had plenty of
time thrust into civilized society to learn that literally saying ‘don’t fuck Joon’ is frowned upon. So he
does this thing where he tries to be subtle, because he knows humans like to read between the lines,
but he makes sure that the lines are really, really far apart so that you basically have to read between
them.”

“Yeah,” I said. “He gave me the same talk. Did he use the phrase ‘experimental coitus’ with you?”

“What?” asked Fenn with alarm. “What does that even mean?”

“You have my copy of The Book of Blood,” I said, “I meant to ask for it earlier.” She was wearing
Sable, which I thought had to be approaching whatever limits it had, because Fenn kept stuffing
more and more into it. She’d stolen all the chairs from around the big table on the lawn.

“One condition,” she said, holding out her gloved hand.

“Which is?” I asked.

“Two conditions, actually,” she said. “Because you gave me time to think about it, which is always
dangerous.”

“Okay,” I said, “What conditions?”

“Alright then, three conditions,” said Fenn with a laugh, “Because you didn’t learn your lesson.”

I gave her my best aggrieved sigh.

“Condition one, I forbid you from looking at the entries on elves and half-elves,” said Fenn.

“Can I ask why, or would that move it up to four conditions?” I asked.

“I don’t know what the bookkeeper told you, but The Book of Blood is somewhat notorious,” said
Fenn. The book appeared in her gloved hand, with its red cover and embossed lettering. It was quite
thick, though that made sense, as it was something of a reference book. She made no move to hand it
over. “Alek Syfriend was this pervert of a gnome who decided that there was a paucity of
information on interspecies relations, where ‘relations’ is code for having sex with one another. He
was really wealthy due to inheritance, so he had the money to travel the world and see pretty much
every species in it, collecting stories and paying whatever necessary to various ladies and gentlemen
of the night to get an up close look. The book turned out to be the single best guide to the mortal
species ever written, but it also appeals to the prurient interest, if cloaked in clinical terms. That’s part
of why it’s hugely popular.”

“O-kay,” I said. “So, the reason that you don’t want me to read from the elf and half-elf sections is?”

Fenn breathed a sigh through her teeth. “It’s, ah, complicated,” she said. “You could call it
something like modesty.”

“From you?” I asked with a smile that she didn’t return. “I mean, you know that when you say ‘don’t
look in this book’ I have to assume there’s something in there that would be of immense interest to
me.”

“It’s not a clue,” said Fenn. “Not everything is a clue. It’s personal. Alright?”

I raised my hands. “Alright, I promise I won’t look up any of the information that you made sound so
tantalizing.”
My mind was racing though, trying to figure out why this would be such an important, somber thing to her. And of course it was the mind’s tendency to go to the extremes and make up the worst possible story, which in this case would be something like, ‘Fenn was the victim of female genital mutilation’, but it was much more likely that, as with her scars, she was just mired in social and cultural ideas and emotions that simply didn’t apply to me. I tried my best not to put too much thought into it, because if she had wanted to discuss it, she would have.

Fenn handed me The Book of Blood. “Alright, condition two, I want to sleep in your bed tonight.”

“Well I’ve got the book now, all your leverage is gone,” I replied. “That wasn’t very smart negotiation there.”

“Eh, I didn’t think you would actually object to having me,” said Fenn.

We had slept in the same large, plush hotel bed together, which had been fine. I had thought that I would wake up with her curled up next to me, like I had occasionally seen her do with Amaryllis during our earlier stay in the motel, but nothing like that had happened, and she’d had what were effectively pajamas on anyway. It was very studiously platonic, the kind of platonic that said, ‘do you see how platonic I’m being’?

“I kind of don’t want anyone to get the wrong idea,” I said.

“Are you so terribly concerned about what Grak thinks?” asked Fenn with a quirk of a smile.

“If you really wanted to sleep next to someone, there’s Amaryllis,” I replied.

“She’s got a creepy yellow arm now,” said Fenn. “Plus I sort of doubt her ability to defend me if we get attacked in the middle of the night. Much better for me to have the most dangerous member of our party an arm's-length away.”

*On a scale of 0-9, how in love with me are you?* I wanted to ask, but didn’t think it was a conversational path that I wanted to go down, not with that flippant of an opening, and maybe not at all.

“Alright,” I said, “You can sleep beside me tonight, but when we get up in the morning you have to make a point of loudly and insistently telling both Grak and Amaryllis that nothing happened between us, okay?”

Fenn watched me. “Was that a joke?” she asked.

“Well, I thought it was funny,” I said. “There’s probably some debate over whether or not that’s enough to qualify something as a joke.”

“I mean, it was really, aggressively unfunny,” said Fenn. “Like you were trying to see whether you could use a lack of humor as a weapon. Were you trying to unlock a new skill? You had Comedy and wanted Anticomedy?”

“Alright, fine, fine,” I laughed. “Two conditions down, what’s the last one?”

“Oh,” said Fenn. She put a finger to pursed lips. “Um, let me think about it.”

“Because you didn’t have a third condition, I knew it,” I said. “Well I’ve already given a lot of ground, and these conditions are bordering on becoming a favor from me to you.”

“Okay,” said Fenn, “I’ve got one. Just to be clear, we’re *not* going to have sex tonight? That’s off the
I blushed at that. It was couched as a joke, the kind of flirty joke she’d agreed not to tell anymore, but I had the distinct impression that it also was the kind of joke where if I took the initiative, it wouldn’t be a joke anymore, or at the very least it would become funny for a different reason. (And then later on, it would become stupid, complicated drama, that much I was sure of.)

“I miss making you blush,” said Fenn with a grin. “Well since we both take Grak’s orders very, very seriously, and that’s off the table, my request,” her face went serious, “My request is, ah, that you try to lower my loyalty.”

“Um,” I said. “I don’t wanna.”

“Because loyalty makes me more powerful and easy to control?” asked Fenn.

“Because I care about you,” I replied.

“Alright, that was the correct answer,” said Fenn.

“In Trifles Tower, when you wanted to leave and the others wanted to go for the gold, I thought that was going to be it,” I said. “So it has to be worse than that, right?”

“I understand why you made that decision,” said Fenn. “I didn’t agree with it, but I’m not some bratty little girl that needs everything to go her way. Look, all I’m saying is that I want you to try to make me less loyal.”

“Seems paradoxical,” I said. “If I try to lower your loyalty on your request, then aren’t I displaying what a great guy I am, thus making you more loyal?” Fenn shrugged. “I don’t want to do it. I don’t want to betray your trust or say whatever mean things there are to say about you. I don’t want to hurt you, and if loyalty can go down, then I think that’s what it would take from me. So no, don’t wanna, can’t make me.”

Fenn stared at me, twisting her mouth into a frown. “Alright,” she finally said with a shrug, “Two out of three ain’t bad. Then I’m going to bed.”

And so I fell asleep to the sound of Fenn’s light breathing and her occasional shift beneath the sheets, as I’d done when we were at the hotel together, and when we woke up in the morning it was before anyone else anyway, which meant that there were no questions to answer about how or why we’d spent the night together.

(Fenn did loudly and insistently tell Grak that she hadn’t had sex with me, and spent some time graphically describing all the ways in which we hadn’t had sex, but she did this out of earshot of Amaryllis. The fact that she was making that joke in front of me and Grak but not Amaryllis was probably significant, but I had decided that social skills were dump stats, so there was no magical aid in unpacking that.)

(As I learned from The Book of Blood, dwarves had something called a cloaca, which was a posterior orifice that served as a universal port for urine, feces, and reproduction. They had no other genitalia. Dwarves engaged in coitus with each other via something called the cloacal kiss, which The Book of Blood described in exacting, clinical detail, but which I will describe here as ‘gross’, particularly the section on ‘cloacal winking’. It was possible for dwarves to crossbreed with a few of the other mortal species, humans among them, with different methods of intercourse depending on whether their partner was male or female. The Book of Blood also described those in exacting detail, and again I think ‘gross’ is probably sufficient. I could sort of understand just from that how Fenn...
wouldn’t want me to read the entry on elves and half-elves, even if it said something innocuous, because there was an undercurrent to the way Syfriend wrote that made me feel like I needed a shower.)

Under different circumstances, the teleportation key might have meant that the entire world was open to us. The teleportation key allowed you to go to either a touchstone or a place where you’d already been before, but in our case the touchstones were right out, because every place with a touchstone was likely to be guarded and warded, something that we really, really wanted to avoid, not just because Amaryllis was a somewhat recognizable princess who a lot of people wanted to capture or kill, but because the teleportation key we had was ridiculously valuable and if anyone saw us arrive they would either try to take it from us, or go tell someone who would then try to take it from us.

That meant that we were restricted to places where either Amaryllis, Fenn, Grak, or I had gone which we could be pretty damned sure wouldn’t be occupied, and which were also in a place that we could walk out of without drawing too much suspicion.

And on top of that, we wanted a specific place, one where we could do research and ask questions about the disease Amaryllis had contracted, as well as about how to fix my drained bones.

That left us with startlingly few candidates.

**Candidate Locations**

1. Amaryllis had spent three years at the Athenaeum of Quills and Blood, and thought she knew several spots that we could enter either it (or the surrounding city of Sanguine) from. Stealth and lies would probably be the name of the game there, though security wasn’t likely to be all that tight, not for the things we were looking for. Rat rot rating: ★★★☆☆☆, Dry bones rating: ★★★☆☆☆, Danger rating: ★★★☆☆☆

2. Caledwich, where Uther Penndraig had tried to pull the sword from the stone, was now home to one of the largest libraries in the world outside the athenaeums. Caledwich was also the beating heart of Anglecynn and the most likely place to run into one of the Princes and Princesses of the Lost King’s Court. Rat rot rating: ★★★★☆, Dry bones rating: ★★★☆☆☆, Danger rating: ★★★☆☆☆, Historical rating: ★★★★☆

3. Cranberry Bay was home to the Athenaeum of Bone and Flesh, and given that my personal problem was a bone one, and bone magic was the primary healing magic in the world, it seemed likely that we could find the solution to both our problems there. The catch was that we didn’t have a great point of entry; Amaryllis had visited Cranberry Bay, but she had been young and not on the lookout for hidden spots she could arrive at with a key without alerting anyone. Rat rot rating: ★★★★☆, Dry bones rating: ★★★★★, Danger rating: ★★★★★ on entry, ★★★☆☆☆ after, Nostalgia rating: ★★★★★

And that was it, just those three. We could have gone to Five Spires, or any other major city, and maybe bought some books there, but one of the things the Empire of Common Cause did was enforce intellectual property laws. The athenaeums had a lot of sway within the empire, which meant that they put some restrictions in place to ensure that magical learning was centralized. This was naturally ‘for the public good’ and just happened to increase power and profits to the lobbying body, which was a complete and total coincidence.

(The empire wasn’t actually all that strong or effective, for a lot of the same reasons that the UN wasn’t strong or effective, but the athenaeums were powerful enough that they could use the empire to propagate a legislative framework that almost all the member polities had implemented, or at least put token effort into implementing.
This was then backed up by the athenaeums wielding their power against the various polities of the empire when they tried to defect from ‘sensible’ intellectual property laws and/or certification schemes. Most of the athenaeums had scholarships and departments devoted to placement of their students, which meant that there was a carrot labeled ‘we’ll pay your young people to come here’ and a stick labeled ‘we won’t send you graduated mages’, but with a lather of diplomacy on top of that basic reality. On top of that, most of the athenaeums were filthy rich and nearly nations in their own right, which meant that they could (and did) use all of the standard tactics that corporations used on Earth, like pumping money into politics, having people write editorials complaining about a politician or policy, filing lawsuits, or doing other things like that.

So if you were a prospective publisher of books, you would look at running afoul of either the governments or the athenaeums, then look at how pitifully small the target market was, and then decide to do something else with your time. And it wasn’t like someone could really be expected to learn magic from a book anyway, not when even the simplest of magics took years of intensive, guided study to wield, let alone wield effectively.

This wasn’t to say that there were no books on those subjects. After all, as Stewart Brand said, information wants to be free. However, in a world that had no global internet, information on Aerb had considerably less desire to be free than it did on Earth, and the bootleg books and underground magicians were supposedly something of a rarity.

Where were we? Oh, right, trying to pick a place to go.

We had most of the discussion the night before we left, over our simple dinners of prepackaged foods.

“Well, my vote is for Cranberry Bay,” I said. “It’s the place I know best.”

“We still haven’t established whether we’re a democracy,” said Fenn. “I, personally, think that we should become an anarchosyndicalist commune, taking it in turn to act as executive officers.”

(That was a Monty Python and the Holy Grail reference, which I naturally recognized, but I was certain that if I called her out on it she would say that of course it was a Monty Python quote, you think that’s some Earth thing? And then she would have smiled at having succeeded in derailing the conversation.)

“We can vote,” said Amaryllis. “Juniper will break any ties. I know the campus of Quills and Blood well and have a number of contacts there, though none that I would feel safe revealing myself to. Still, I can send one of the three of you with some advanced intelligence that should make information gathering easier. Healing is a subspecialty of the blood mages. That has my vote.”

“Bone and Flesh seems more likely to help with our problems,” I replied. “We’d be banking on connections outweighing the actual proximity of information if we went with Blood. And neither blood nor bone magic can cure the rat rot anyway, so it’s better if we go for the place that has an emphasis on healing that’s not within the realm of its titular magic, right?” (I had tried with bone magic, just for the sake of it, but it hadn’t worked; diseases were, as stated, outside the wheelhouse for the two most common healing magics.)

“I vote Bone and Flesh,” said Grak. “Blood has always been the weaker healing magic. Reaching for your contacts is a risk I don’t want to take. If we go at the right time of day we can reduce the risk of witnesses.”

“Fine, I’m dying, let’s just do this,” said Amaryllis.
“Welp, looks like we’re going to the Athenaeum of Bone and Flesh then,” said Fenn. “I’ve always wanted to see Cranberry Bay.”

She wasn’t the only one. Cranberry Bay was one of the places that I created, and it was special to me, for a very simple reason: I had made it when I was nine years old, in the first campaign I had ever run. It was a simple, innocent place, and the only question was what the lens of Aerb had made of it.
Don't Split the Party

After a moment of blinding pain passed by, I blinked and took in my surroundings, looking for witnesses or threats. I breathed a sigh of relief when I saw none, and slowly straightened up. The moment of crisis had gone by in an instant, because now if someone found us where we shouldn’t have been, they wouldn’t immediately think that we were in possession of a billion-dollar piece of equipment that nations would have killed to get their hands on. We’d still be in trouble, but it would be more ‘breaking and entering’ trouble, not ‘stole a nuke’ trouble.

Our destination was a fancy restaurant with a private back room where a much younger Amaryllis had eaten with her mother and a number of guests. We had gone in the morning, before the restaurant would be open, on the hope that the only people there (if any) would be kitchen staff doing prep work, and then ideally we could slip past by leaving out the front door. This, we accomplished with relative ease. I again used the hilt of the Anyblade to fake us up a key.

And with that we were basically indistinguishable from any regular citizens of Cranberry Bay. Amaryllis wore a traditional veil of the women of the Mehkadi Desert, which would prevent anyone from recognizing her even if they knew her face. She wore long sleeves as well, ones that flared at the wrist, with gloves to cover her yellowed hand and missing fingernails. These clothes had been pulled from Fenn’s glove, which had apparently been loaded with a fair number of clothes for all of us, Grak included. When I questioned her about this, Fenn said that I shouldn’t worry my pretty little head about it, and when Amaryllis questioned her, Fenn had only remarked that Sable was purpose-built for shoplifting, which she must have done back in Barren Jewel.

The plan, in short, was that we would go into the Athenaeum of Bone and Flesh, raid their library for information, and find a few people who would be willing to talk about bones that had been drained of their power and/or how to cure serious diseases without having to fight a unicorn. We were going to (sigh) split the party so we could accomplish what we needed to as quickly as possible, then leave before sundown with no one aware that we’d even been there. As soon as we’d formed that plan, I had thought about a title card saying, “Three Weeks Later”, or “The Gang Gets Captured” or something deadpan like that. Simple plans made me nervous.

We did split up though, and I was on my own for the first time since … well, since Silmar City, when Amaryllis had left me to die. The strongest argument for me not going out on my own was that there were still gaps in my knowledge, and while most of the major ones had been filled by this point, there were lots of subtle cultural things that I was sure to miss. With that said, the athenaeums were places of learning that people from all over Aerb traveled to, whether by the imperial train network or by teleportation key, which meant that they were much more socially and culturally diverse than almost anywhere else in the world. That meant that I had a lot of leeway to be weird.

So Fenn went to go con someone into talking about drained bones, Grak went to go bluntly ask someone about rat rot (a name which so far seemed to exist only in the game layer), Amaryllis went to go rest in a rented room at an inn (the teleportation key tucked inside a tattoo I had put on her skin) and I went straight for the library.

“The daji hits you, take 23 damage,” I said, without looking up from my notes.

Craig made a few marks on his character sheet. “I’m down,” he said.

“And that’s why you never split the party,” said Reimer with smug satisfaction.
“Should I roll a new character?” Craig asked me.

“Flora and Ike are across town,” I said, pointing to Tiff and Arthur, “Finch is two blocks away, but he’s got no idea that you were attacked, and at best he’d be doing a check to stabilize.”

“Which I could do,” said Reimer. “If I knew that you were dying, which I don’t, because we split the party.” He looked to me. "My turn next?"

“Hang on,” I said. “Craig, do you have anything that can save you? Any special equipment, any magical effects you forgot about, something like that?”

“Nope,” he replied.

“Alright,” I said. “You’re dead. It’s plausible that your body will be found and later recovered by the party, and then you’ll be raised from the dead after that, but most likely all your stuff is going to be gone. That’s the best case scenario for you right now, if you’re really attached.”

Craig waffled, which made me feel bad, because that meant he was actually considering it. “No,” he finally said, “I’ll figure out something else.”

“Now me?” asked Reimer.

“So the argument against splitting the party is that we’re stronger together than apart, right?” asked Tiff. “Like, if we’d run into that daji as a team, then we’d have smoked it without any problem.”

“The game’s balanced around a team of three to six adventurers,” said Reimer. “They’ve got non-overlapping magisteria, so it’s not just that they’re stronger together, though they are, it’s that between all of them, they can do pretty much anything. By themselves, most of the classes can only take on a very specific range of tasks, except high level wizards, because wizards are OP.”

“Actually, I think it’s mostly about the story,” said Arthur. “You can cover more ground if you split up, but not really, because you can’t actually do things at the same time and the players are still sitting there. Half the party is out of the narrative spotlight, which is boring. The reason you’re not supposed to split the party isn’t that people will die, it’s that you’re taking the ‘collaborative’ out of ‘collaborative roleplaying’.”

“Yeah, no offense Joon, but I’d like to join back up with Reimer as soon as possible,” said Tiff.

“Thanks for the eulogy, guys,” said Craig.

The thing was, I didn’t actually know whether the “don’t split the party” trope applied or not, because I knew next to nothing about the mechanical implementation of the game (or the thing the game was running on). What happened to Fenn and Amaryllis when they were out of the narrative focus? I had no idea. It was one of those existential things that I was trying not to think all that much about for fear that I would descend into the depths of madness.

My Dungeon Master had unknown resources that really could include simulating not just all two billion square miles of Aerb and five billion inhabitants, but all nine thousand hells as well. The only thing that I had seen to indicate that this wasn’t what was happening was the fact that a few things had seemed narratively convenient, which wasn’t very strong proof. But again, that was the kind of thing I really was trying not to think about as I walked away from the others.

It was somewhat easy to direct my thoughts elsewhere, because I was in Cranberry Bay, the site of the very first adventure I had ever written.
Cranberry Bay was (very) loosely based off of San Francisco. It was built up on the tip of a peninsula that made up one side of the bay’s mouth. There was no enormous bridge spanning the bay here, but there were piers jutting out into the cold bay water, an island with a maximum security prison on it, and steep hills divided into colorful districts. Every year, cranberries floated up from the depths of Cranberry Bay and were scooped up with large floating nets, to be gathered and sold around the world.

(What’s that you say? Cranberries don’t work like that? The reason cranberries can be seen floating on cranberry marketing material is because the process of wet harvest involves flooding a cranberry bog, agitating the vines, and then collecting the floating cranberries? Yeah, well I didn’t know that when I was nine years old, give me a break. I assumed that in Aerb, cranberries worked differently, or the fruit that was collected from Cranberry Bay was named something else and had only looked and tasted similar to early explorers.)

The restaurant we’d come out of was at the top of the hill, meaning I had a wonderful view of both the city and the bay. It took my breath away a little bit. I had so far seen Silmar City, a lifeless, uninspired place that seemed like it had taken notes from Wichita, and Barren Jewel, which was nothing too spectacular to look at from the outside and a hive of scum and villainy from the inside. Cranberry Bay was different. Where Barren Jewel seemed to be limping along through inertia, Cranberry Bay was a city in the prime of its life, a clear festival of commerce and culture. And as I watched, I could see that we were just in time for the cranberry harvest, because the bay was tinged red and big ships with white sails were dragging nets behind them.

Other than the titular cranberries, there wasn’t that much to suggest the place that I’d built. This city was too dominated by the athenaeum, and it wasn’t really that much of a shipping city at all, not like I’d drawn it up, because teleportation magic meant that with a few exceptions, it didn’t make any sense to send things across the world by boat. The ships in the bay didn’t even have the colors of the Cranberry Guilds on them, which meant that the whole plot about cutthroat cranberry trade wasn’t in play. I didn’t have time for a quest like that one, but it was still a disappointment. A lot of the potential hit of nostalgia had clearly been removed, and I wondered whether that was by intent.

The Athenaeum of Bone and Flesh wasn’t hard to find; four of the five tallest buildings in the city were on its sprawling campus. There was no unifying architectural style to Cranberry Bay, but two of those four buildings seemed like they were meant to be a matching set. Both were giant castles, fifty or sixty stories tall, and at least on the exterior they looked like they had been built by mad wizards who had been told that they could build whatever rooms they wanted so long as they never tore anything down. I had never seen a building that large which still looked ramshackle, and I was immediately suspicious that it was all just aesthetic, a facade meant to look quirky but which hid an interior of straight, clean lines.

It felt good to be on my own. I had always been a fairly solitary person, and with the exception of tabletop nights, I preferred to spend my time alone. I was one of those people who always felt relieved when plans fell through, because it meant that I was suddenly free from the effort of being around other people. Even when it was just Fenn and I, I didn’t really have missions to undertake on my own, nor did I often leave the hotel room to get some fresh air, at least not without her by my side. I liked Fenn, I really did, but being without her was freeing. The game had a bar labeled “mental exhaustion” and the way the stats were set up it seemed logical to think that there was a hidden metric somewhere called “social exhaustion”, one which needed some time to be recharged.

I was out of my magical armor, though I did have a bandolier of fairies across my chest, and the Anyblade was in its ring form, ready to spring to a greatsword with a thought. I had Ropey too, who was coiled into a messenger bag by my side, plus my throwing dagger, a few emergency bones, a sizeable sum of money, and a vial of liquid nicotine I was hoping I wouldn’t have to use. There
were some taboos against going around armed and armored, but few nations had laws against it, and Cranberry Bay (part of the Monarchical Democracy of Esplandian) was not one of them. Come to think of it, I was pretty sure that there weren’t many laws against wearing full body armor in America either. Still, it would have marked me as squarely out of the ordinary, and that was something I really didn’t want to be. The bandolier was maybe a bit unusual, but not so much that I thought I would draw stares.

I kept wanting to stop and look at things. I’d felt the same way in Barren Jewel, but Barren Jewel was a shithole where I felt like I was constantly in danger of being mugged or pickpocketed, and if not that, then maybe just stepping in refuse. Cranberry Bay was clean, and if not quite organized into a sensible grid, then at least with a degree of city planning and complex infrastructure. That made exploration all the more tempting, because it meant that I was more likely to be safe if I wandered off to a place serving teas that billowed with smoke, or went into a shop that had floating stones in its storefront, or decided to follow along after a green-skinned woman with a shell on her back to see what her deal was. The shell was decorated with a complex, miniature cityscape which had been affixed to it, and she walked in such a way that all the buildings of the city stayed level with the ground. I stopped myself from wandering after her only when she saw that I was paying attention and flashed me a smile.

Amaryllis was dying. I wasn’t dying, per se, but my hand was numb and uncoordinated, my appetite was weak, and I was getting some nausea from time to time that wasn’t going to do me any favors in a fight. The anemia that was supposed to accompany the effect wasn’t a real problem yet, because I’d been topped off on blood when I leveled, but in the long term, it wasn’t looking good. That was what was at stake here. Wanting to go fuck off and look at the wares in a random magic shop or follow a turtle woman was basically the equivalent of me putting off homework until the last minute because I wanted to watch anime or write up a city description for a campaign we would never end up playing. It was a mild surprise to find that this part of me hadn’t changed all that much during my three weeks on Aerb. I did eventually manage to make it to what I thought of as ‘campus’ without getting distracted by men in two-foot-tall hats or a gaggle of children with glowing red rings around their necks.

The Athenaeum of Bone and Flesh was fucking huge. It was the only authorized place to learn bone magic in all of Aerb, and had an enrollment of four million students. That made it about six thousand times larger than my high school. In terms of students alone, it was larger than Los Angeles, and that was without including all the teachers, janitors, cooks, landlords, housekeeping, entertainment, et cetera, all the people that it took to make the athenaeum a functional institution, plus every person that was indirectly employed because of the needs of the students, teachers, and staff.

I knew that I was in the thick of campus by the fact that everyone around me seemed to be wearing bones. I was pretty sure that some of that was a fashion choice, because it wasn’t like there were many opportunities to actually practice bone magic, and bones were expensive enough that you couldn’t just use them willy-nilly. Some people wore them like Tova had, with bones strapped in bandoliers, while others wore them coming up from the back, or bundled in a quiver at the hip. Most of the bones were big, but some people favored lots of small bones, like those from a salmon, arrayed within easy reach. I saw a few distinguished-looking people with skulls atop walking sticks, but they were a rarity.

There were relatively fewer humans among the students and faculty I saw walking around; unlike Barren Jewel, they were a plurality here rather than a strict majority. There were quite a few dwarves, mostly traveling in packs, but I saw only two elves. The rest were a riot of races, sometimes in groups and sometimes in mixed company, many that I recognized and a few that I didn’t. Save for the section on dwarves, I hadn’t read through The Book of Blood yet, largely because reading a reference work cover to cover seemed like a pain in the ass, especially when there were other books
waiting to be read and skill training that needed to get done.

We’d done the minimum amount of research ahead of time, so I knew which building I was going for. It was one of the larger ones that sat between the wide green concourses, Coeus Hall, the biggest and most generalized of the athenaeum’s eight different libraries. There were people streaming in and out of it, though fewer than I had imagined there would be. It made sense when I thought about it though. Most of the students were here studying to be bone mages, going through the same five year course of study that Bormann had mentioned to me, which meant the same or similar material and instruction, with the same or similar textbooks. Libraries were more useful if you wanted to go deep into a subject and find the esoterica, so the students going to those would be the ones who were specializing.

I went in through the front doors, passing through a few wards that Grak had warned me about (wards to keep the books in and the water out) and trying to look like I belonged. It was by far the largest library that I had ever been in and it seemed as though the architect had designed the entrance so that I would know it. The library was a hundred feet tall, with most of it sitting under an immense dome. The floors of shelving extended up into the dome, but with a hollow space in the middle that seemed to be there specifically so that you could see all the shelves that radiated out on all ten of its levels.

“First time?” asked a woman in an off-white robe. She was bog-standard human, maybe a bit on the short side, with her hair pinned up in an elaborate bun. She was giving me a pleasant smile.

“Uh, yeah,” I said. I looked around the library, and behind a long, curved desk I could see other people in off-white robes stacking and sorting books. It was a uniform then, which meant that this woman was a librarian. Regrettably, there was no name tag.

“You were staring,” she said, gesturing to the dome. “It happens.”

“The architect wasn’t thinking about what the view would do to foot traffic, huh?” I asked.

“He was under a forge frenzy, actually,” said the librarian. “So in a very real sense, no, he wasn’t thinking about foot traffic. Would you like a tour?”

“Yeah,” I said. “But, I’m actually under a bit of a deadline, so ...”

“Is there anything I can help you with?” she asked.

“Um,” I replied. I didn’t know the library policy on whether non-students were allowed to look at books, and didn’t want to ask in case the answer was that they weren’t. I didn’t know what assumptions she was making about me. “If I told you I was looking for a particular subject rather than a particular book, could you help me find something worth reading?”

“Certainly,” said the woman. She pointed a finger at herself. “Clara.”

“Sam,” I said. “You work here?”

“Work study,” she replied. “We’re going to need the catalogs,” she began moving towards some large rows of cabinets. “I’m not a proper librarian, I work here because it ‘builds character’, nominally to defray the cost of tuition. I can still probably find you what you need.” We reached the cabinets and Clara looked at me expectantly. “What is it that you need?”

“I was looking for information on a very specific, non-contagious,” hopefully non-contagious? “disease, but I don’t know the name of it, just the symptoms, plus where and how it was contracted.”
“Okay, so you’re going to need a reference book,” said Clara. “It would probably help to nail down geographical region, if possible. You’re sure it’s non-contagious?”

“Pretty sure,” I replied. “It was originally spread by rat scratch. And the region was, ah, the Risen Lands exclusion zone.”

*And if she goes to grab someone else, that’s my cue to leave, because I am absolutely not going to let myself get ambushed for having asked the wrong questions.* I wasn’t sure how smart it was to be sharing that information, but this woman was clearly a low-ranking bone mage on work study, and whatever vast, shadowy conspiracy was arrayed against Amaryllis (and therefore me) they couldn’t have spread agents that far, not given that Amaryllis had only been known to have rat rot for something like two weeks.

“Huh,” said Clara. “If it’s confined to the exclusion zone you might be out of luck,” she said. “Worrying about disease in a major exclusion zone is kind of … not done. Is this for a particular purpose?” She saw my hesitance. “Just curious, you don’t have to say if it’s secret.”

“Did you know that Anglecynn drops people into the exclusion zone as a form of punishment?” I asked.

“Ugh,” said Clara, “Yes, I’m well familiar with that bit of barbarism. So someone made it back, got inducted into the Host, but contracted a disease along the way?”

“Something like that,” I replied. “So I’m here, trying to at least figure out what kind of disease it is. He’s got about a week left to live, which I hope explains why I didn’t want to take the tour.” And if she asked about the distance, which was on the order of ten thousand miles, I would just tell her that I got my orders by radio. This wasn’t a terribly clever story, but there was only so much I could do.

“Well then, let’s get moving,” said Clara. She began pulling out a long drawer of organized cards from the cabinet, and that was when I realized that this library used actual card catalogs, because it obviously didn’t have a computer system. “Now, the hope is that it’s not unique to the Risen Lands. They’re a former territory of the Kingdom of Francorum, so we can probably start by, ah -- here.” She pulled out a card and showed it to me. “Start with *Diagnostic Manual of Fatal Diseases of the Bretaigne Continent and Zorish Isles.* Come find me if you’re having trouble.” She grabbed a pencil and paper from the top of the card catalog and copied down the information for me. “I’ll be by the entrance, hassling people who are staring in awe at the upper levels.” She gave me a smile and then left.

The library didn’t use the Dewey Decimal system, so it took a little bit of wandering for me to find what I was looking for, but however they were classifying their books, they were using lots of numbers, and then helpfully labeling all of the shelves and books with those numbers. I found the book I was looking for three levels up, a thick, imposing one next to other thick, imposing ones, and went to the index, looking for ‘rat rot’. When that didn’t bear fruit, I started a search, reading brief descriptions and looking mostly at the symptoms and disease vectors.

I was in the middle of doing this when Clara came by, leading a man with red hair, freckles, and red armor joined at the seams with nearly-black leather. He had a sword at his hip and both a cloak and shield on his back, which would have been enough to mark him as trouble if the look on his face hadn’t said it all.

“Sam,” said Clara, “This is your friend?”

I stared at the man and desperately regretted not dumping all my points into social skills. “Uh.”

*Nailed it again. They keep setting them up and I keep knocking them down. Who needs special*
magic when you’re this good at talking your way out of trouble?

“Have you found anything on ‘rat rot’ yet?” he asked.

I was absolutely sure that my face gave me away. I could feel tension in my stomach and ice in my veins, and I was pretty sure that I was going to start having cold sweats in short order. Stupid 2 POI and 8 Deception meant that I was going to give it all away without actually having said anything. In which case, the logical thing to do was to get myself in a position where I could run away and disappear into the city. I didn’t know whether this guy was a friend or not, but the probably-magical items, slight family resemblance to Amaryllis, and the fact that he could only have learned about rat rot from our enemies were all pretty sure signs in favor of slapping a “foe” designation on him.

“Clara, if you could excuse us?” I asked. No sense in letting her get caught in the inevitable crossfire.

**Virtue: Ruthless Removed!**

**New Virtue: Conscientious!** *(Flattery +5, Romance +5)*

I tried to do my best not to react to those notifications. Ruthless hadn’t actually done anything, at least not in its level 0 incarnation. I didn’t actually use either of the skills I was now getting a bonus to, but it was a sizeable impact to them, and was better than nothing.

“Sure,” said Clara, though she was giving the both of us a wary look. She left without further comment, and the man in front of me waited until she was out of earshot to speak.

“Can you imagine my luck to hear that someone else was looking after a disease from the Risen Lands contracted by rat?” he asked. “Tell me where she is.”

“Who?” I asked. “Actually, first, who are you?”

“Larkspur Prentiss, second of his name, Foreign Security Director of the Kingdom of Anglecynn,” he replied. “My best guess would be that you are Juniper Smith, traveling companion to my erstwhile cousin. Tell me where she is.”

“Who?” I asked. “Actually, first, who are you?”

“Larkspur Prentiss, second of his name, Foreign Security Director of the Kingdom of Anglecynn,” he replied. “My best guess would be that you are Juniper Smith, traveling companion to my erstwhile cousin. Tell me where she is.”

“Sorry, it’s not ringing a bell,” I replied. **Armor, sword, cloak, shield, all probably magical, plus he’s probably got training in at least one school of magic, maybe many, plus hidden magics I would have no way of knowing about, plus extensive training as a fighter. That point I put into LUK was a waste.**

“Where, exactly, did you come from?” he asked, looking me over. **The intelligence reports are muddled and inconsistent with regards to you. Fenn Greenglass I already knew of, hand-selected in fact, and it doesn’t take much of a guess to know that the gruesome fate of Browsnout Quills-in-hand was her doing.”**

“I still don’t know what you’re talking about,” I said, not caring that the lie was transparent, “But it kind of seems like you’re shit at your job.”

Larkspur looked me over. “Do you think flippancy is how you escape this?” he asked.

“I think that I don’t have to escape this,” I replied. **My guess is that your powers as a Foreign Whatever don’t include going into an athenaeum and kidnapping or killing a random person there. I’m sure that you could make up some kind of story about how I was a dangerous criminal that you tracked down, or something more clever, but there would be an awful lot of witnesses, and my guess is that you’re bound by politics just like any other Prince or Princess of Anglecynn is.”**
That was my read of the situation, anyway, and if I was wrong, then Larkspur’s reaction would tell me something, and my cockiness about it would demonstrate me to be an overconfident idiot, which might be its own advantage. I had no idea whether I was playing this right. The fact that he was apparently here alone was suggestive, and obviously I knew that he was both the guy who ordered the fireteam after Amaryllis, and that he was also chasing after a teleportation key.

“You’re gambling,” he said. “You think that I care more about politics than about catching Amaryllis.”

I shrugged. “Again, I don’t know anything about what you’re talking about. And if I did know anything about anything, I wouldn’t tell you, because you seem like an asshole.” (And on second thought, I didn’t actually believe that it was just luck that brought us together, especially not the smarmy way that he said it, it was probably some kind of probability manipulation, clairvoyance, prediction, or LUK, and the fact that he tried to slip that under my nose like he was oh-so-clever made me hate him even more.)

“That it would appear that we’re at an impasse,” said Larkspur, confirming that politics really were a legitimate problem and that a fight in the athenaeum library of a foreign country would raise a lot of questions that he didn’t want to answer. He looked at the book in my hand. “I wasn’t being flippant, I really did want to know whether you had found anything.”

I slid the book back onto the shelf. However he had found me, the fact that I was here gave him some concrete information, namely that rat rot was still a problem that we were working on. He’d know that just from having read the title of the book I was holding. He seemed to be leaking information far worse than I was, but that wasn’t much consolation, because I was pretty sure that he would beat me in a fight, even if he had come alone.

“Then it would appear that we’re at an impasse,” said Larkspur, confirming that politics really were a legitimate problem and that a fight in the athenaeum library of a foreign country would raise a lot of questions that he didn’t want to answer. He looked at the book in my hand. “I wasn’t being flippant, I really did want to know whether you had found anything.”

I slid the book back onto the shelf. However he had found me, the fact that I was here gave him some concrete information, namely that rat rot was still a problem that we were working on. He’d know that just from having read the title of the book I was holding. He seemed to be leaking information far worse than I was, but that wasn’t much consolation, because I was pretty sure that he would beat me in a fight, even if he had come alone. *But would he beat me in a race?*

“I don’t know what hold she has over you,” said Larkspur, “But if it’s money, I’ll double it, and if there’s some magical item she’s invested in you --” he glanced at my ring, “-- I am in a position to offer you more. Blackmail, hostages, magical compulsions, whatever it is, I can make problems disappear.”

Larkspur was standing at the entrance to the aisle, with a thick railing behind him, and a three story drop down to the library floor beyond that. I was between the books, with not enough room to swing a sword. He was constrained, at least in part, by politics, and while dragging me out of the library probably was an option, it was one that he was loathe to pursue, for pretty obvious reasons. Me? Well as Reimer used to say, politics is a dump stat.

I ran straight for Larkspur, using every ounce of blood magic I could muster, while at the same time reaching my hand into my messenger bag and readying the Icy Devil tattoo if he tried to grab me. I ducked down as he drew his sword and got under him, then pushed with the power of a Sanguine Surge, trying to send him over the side of the railing. He turned to the side to avoid me and my shoulder clipped his stomach, sending him backward. I went over the edge, as planned, and flung my sentient rope toward the railing.

One end of Ropey wrapped itself tight around my wrist, while the other slipped through the posts and knotted itself around them. I fell twenty feet and had my shoulder nearly wrenched from my socket, breaking a number of bones in my hand in the process, then swung back in toward the lower levels and slammed up against a railing, which I quickly climbed over. Ropey fell down from the floor above and started quickly coiling himself around my chest, which I felt a moment of panic over before realizing that he was fashioning himself into rope armor for me.

I stayed on the second floor only for long enough to shove fairies into my mouth, then vaulted over the railing and brought the Anyblade out to its full extension of eight feet and attempted to brace...
myself against it. My clever plan had been to retract the blade when it made contact, allowing me to cushion my fall, but I heard the internal crunch of a rib and ended up coming clumsily down on a table, which was painful but not blindingly so.

From there I was up and running in short order, looking back only for long enough to see Larkspur jump from the fourth floor. It would have been really nice if he had been forced to take some pain and injury getting down, like I did, but when he was two feet from the ground he did what was clearly a double-jump and landed on top of a table, then gave chase with his sword in one hand and shield in the other.

I swore and booked it, making each step a Sanguine Surge timed to my racing heart. I reached into my bag as I went, grabbing the first bone I could find, and sucked it dry of END before tossing it aside to grab the next one, which went to SPD as I raced past frightened and bewildered students and library staff.

But of course it wasn’t going to be as easy as just bum rushing my way through the entrance, because there were two people standing there. The first was an enormous guy in full plate, with a concealing helmet. He had a machine gun at his side, which he wasn’t using, instead preferring to spread his arms wide like he meant to either block my path or catch me. The other was a slender woman with horns who held a glowing staff that she was spinning, twirling it faster with each revolution, which I did not like the looks of at all. I drained another bone for SPD as I barreled ahead.

I threw the dagger at her and wasn’t terribly surprised when she had no reaction to being struck in the face point-first. Instead, there was a plunk and the armored guy’s head moved back a bit; this was that same bullshit soul linking thing that I’d squeaked my way out of back in Silmar City. The dagger returned to my hand, landing in my palm at a speed that was painful. This time I didn’t have a convenient elevator shaft to drop one or both of them down, and I didn’t have the void rifle either. My objective was easier though, because I didn’t have to actually kill them, just escape.

I turned the Anyblade into a halberd and ran right for the guy in armor, then at the last second, slammed it down into the ground and tried my best to leverage myself up and over him like I was pole vaulting, retracting the Anyblade as soon as my weight was off it. I was still riding a high of SPD from the bones and everything seemed to be moving in slow motion; I saw the brute’s hand reaching up for me as he tried to track me and twisted out of the way, then landed on the ground by the door just as the glowing staff became perceptually identical to a translucent disk.

I burst out the door without looking behind me to see what that weapon’s new shape was capable of. I hooked to the left once I was past the door and was treated to the sound of breaking wood as the disk spun through the air where I had been. I pulled my last bone from my bag, shrunk the Anyblade down to ring size, and tried to pull SPD as slowly and steadily as possible to ensure it would last. Then I put all my efforts into outpacing them and tried to figure out what I was going to do next.
Skill increased: Blood Magic lvl 20! (Skill can no longer be increased by amateur training.)

New Virtue: Hypertension!

Skill increased: Athletics lvl 20! (Skill can no longer be increased by amateur training.)

New Virtue: Long-distance Runner!

I stopped using Sanguine Surge with every step once I was down a thousand drops of blood. I’d had a moment of panic when I’d gotten the Hypertension virtue, because the bar tracking blood had seemed to go from almost entirely full to half-full in a matter of an eyeblink. The numbers had changed though, and it was 74K/150K now, which seemed to indicate that my body could or would hold twice as much blood as it could before. I was hoping that I had also gained access to more magic, but now wasn’t the time to do tests. I didn’t want to spare the time to look at Long-distance Runner either, because I was pretty sure that wasn’t anything to get excited about.

I tried to move semi-randomly through the city streets, and kept up a full run until my chest began to ache. I was grateful for the extra points I had put into PHY, because I was pretty sure that the boneitis would be hitting me harder if I hadn’t. I eventually came to a stop in an alley and hid behind a very square-shaped dumpster.

Problem #1 was that I didn’t know how Larkspur had found me, or whether it actually was anything other than blind luck that we ran into each other. It was hard to infer what kind of conversation he’d had with Clara, which would have clued me in on at least what assumptions he’d held going in, but I wasn’t sure that time spent thinking about that would actually be helpful, especially because his half of the conversation was probably extremely deceptive. It was possible but improbable that he had asked her the same questions I had, which might have led her to ask him if he knew me, and them to come up together. I didn’t actually know for sure one way or another.

Problem #2 was that it hadn’t actually been that long since I had gone into the library, we weren’t meant to meet up at the inn until sundown, and I didn’t know where Fenn or Grak had gotten off to, only their mission parameters. I thought that Amaryllis was probably safe, because Larkspur had been asking me where she was, which he wouldn’t have bothered with if it were trivial for him to find out. Had he known that I was going to be in the library? Or had he been guided there by something and not known what, exactly, he would find? It didn’t particularly seem like he had been ready to deal with me, and I wasn’t just saying that in hindsight because I had gotten away.

If Larkspur hadn’t known that I was going to be in the library until he saw me, then my presence gave him more bits of information than I thought it had, but it still didn’t seem like an utter disaster. I had learned at least a little bit about him, his capabilities, and his team members, which I had to regard as a plus. On balance, that was worth half my fairies and all the bones in my bag, along with the information that I’d essentially ended up trading to him, so long as the whole party got back together and in one piece.

I slipped my bandolier into my bag, told Ropey that I didn’t need him as armor at just that moment, and stepped out of the alley, looking around carefully to see whether anyone was looking for me. I was fortunate that all three people I had seen were pretty distinctive, even by the standards of the multicultural wonderland that was Cranberry Bay. There was a strong possibility that there were others I hadn’t seen, since five was the magic number for teleportation keys, but looking askance at
everyone that I saw would only make me stand out more.

I ducked into a clothing store and bought the first two things I thought would work, paying quickly and then stepping into the changing room to put them on right away. I ended up in loose, earth-green pants that were barely held up by a tight belt, and a loose-fitting rosy red shirt that seemed similar enough to what I had seen people wearing on the street. In the changing room, I told Ropey to snake under the shirt, and he followed my instruction perfectly, coiling himself around my arms and chest in a way that wasn’t all that noticeable. With just the messenger bag visible, I gave every appearance of being an unarmed innocent.

I made my way through the streets of Cranberry Bay, working in the general direction of the inn we’d parked Amaryllis at. I was worried that I was being followed, and used the Anyblade for a mirror a few times to discreetly check behind me. Larkspur had touched me, and if he was prepared, he might have had a chance to stick some kind of magical tracking device on me. I’d checked over my clothes and hadn’t seen anything, but just for the sake of safety I had left the old clothes back in the changing room.

My lack of information was unnerving me. I had a fairly decent handle on most of the common magic systems, and even some of the rarer ones, but for a high-ranking Prince of Anglecynn, the sky seemed to be the limit. Magic items in particular seemed like they followed the D&D homebrew rules that I’d used, which were basically that magic items could do anything, so long as it was cool, with their awesomeness mostly prevented from making too big an impact on the world by the fact that there were very few of them. An item that allowed you to track someone you had touched was definitely not out of the question, but the possibilities were so endless it was almost not worth thinking about.

I found a room at a hotel some three blocks from where Amaryllis was staying, making sure that my room was on the second floor and had a balcony that would allow me to both watch for trouble and make a quick exit (and for some reason, paying for a hotel room using pink-and-red paper money still tripped my internal weirdness detector, probably because a part of my brain was saying that I wasn’t old enough to rent a hotel room). From there, I set up a chair positioned to watch both the balcony and the hotel door, which I firmly locked, moved a dresser in front of, and then surrounded with Lecher’s Vine for good measure.

Then I waited, with the Anyblade in one hand and my throwing dagger in the other.

And then I waited some more, thinking that at any moment they might track me to this place and try to take me down.

After about half an hour I decided that if they knew where I was, they were staking me out, but that didn’t make all that much sense, because Larkspur knew that a teleportation key was in play, and didn’t know where Amaryllis was, so for all he knew, I might have gone into this particular hotel in order to meet up with her and then leave Cranberry Bay forever. No, wait, he might have been able to talk to the receptionist and asked about someone matching my appearance, but then … setting up an anti-teleportation ward? I didn’t have a firm grasp on how Larkspur thought or what resources he had available to him, and surreptitiously putting up an anti-teleport ward around a hotel room on the second floor seemed like it would be legitimately difficult.

Still then, where was he?

I waited another four hours, listening to the sounds of the city coming in through the balcony, and occasionally going out to check that there wasn’t a warden pulling a spiderman and tracing a ward around my window. After some time had passed and I started getting bored, I practiced with the returning throwing knife some, eventually leveling it up to 16, which felt like a poor use of my time.
But no one showed up, there was no secret attack, and when the sun started to set, I moved the dresser back from the door and left the hotel.

I was still on my toes when I got back to The Pink Lady, where we’d parked Amaryllis, but much less so. When I got up into the room, Fenn, Grak, and Amaryllis were all waiting there for me.

“Weren’t you wearing different clothes?” asked Fenn.

“I ran into Larkspur Prentiss,” I said. I saw Amaryllis’ face go tight at that, but Fenn gave me a look of incomprehension. “He’s the guy that sent your fireteam after Amaryllis?”

“Oh,” said Fenn, “That Larkspur Prentiss.”

“I lost him a few hours ago, but we should probably leave,” I said. “It might go without saying that I didn’t have any luck at the library. There might have been a minor fight. Also, I need more fairies.”

“And that was all you did?” asked Fenn as she reached out with Sable and started dumping dead fairies into my waiting hand. “Personally, I found out everything there was to know about your bones, plus I went shopping, plus I helped a lost boy find his mom, plus I entered and won an archery contest, and after that --”

“We can have this conversation elsewhere,” said Amaryllis. She lifted her sleeve and peeled the tattoo from her skin, until she was holding the teleportation key in her hand. “Back to Weik Handum, for now.”

“We need to talk about how he found me,” I said. “I don’t believe it was just coincidence, and we didn’t decide to go to Cranberry Bay until yesterday, which means that there’s an unknown power in play. Amaryllis?”

She used her good hand to rub her face. A day of rest didn’t seem to have done anything for her; if anything, she looked worse than the day before, even if her long sleeves and gloves were hiding the worst of the affliction. “Was he expecting you?” she asked.

“I’m not sure,” I said. “I don’t think so. It felt like … like he came to the library looking for the same book I was, and then wasn’t entirely surprised to find me there looking at the book.”

Amaryllis looked at Fenn and Grak. “Anglecynn has state secrets,” she said. “I have to give some consideration to what I divulge, if I ever hope to come back into power. I don’t think that he’ll be able to easily replicate the feat of stumbling across you.”

“That’s not good enough,” I said, keeping my tone firm and even. “Explain what he used.”

Amaryllis looked at me, and I felt an almost overwhelming pity for her. She had been beautiful, and that beauty was still mostly there, but her inner core of strength, what I had seen as her defining feature, was on the verge of collapse. I wanted to take back what I had said and let her be, or bring it up later, more gently. Future political ramifications over information security should have been the furthest things from anyone’s mind, but that was her way of trying to piece her life back together, or pretend that she could go back to being the person she must have been before.

“Explain,” I repeated, because it crossed my mind that POI was the ability to withstand other people, and I couldn’t just give in to feeling bad for her because I was avoiding putting points into social stats.

“It’s only a guess,” said Amaryllis with a sigh, “But my guess is that he dipped into the strategic elf reserve.”
“The what?” asked Fenn.

“It’s possible for a sufficiently skilled bone mage to draw luck from bones,” said Amaryllis. “Luck is a property possessed almost exclusively by elves, so the kingdom has been covertly collecting their bones for quite a long time.”

“Holy shit,” said Fenn. Grak was frowning.

“Larkspur wouldn’t be able to take too much from it though, and if his application of luck only got him to you, and you’ve stayed escaped for a few hours, then I don’t think there’s a threat,” said Amaryllis. “There are upper limits to what even highly concentrated luck allows you to do. My guess is he used a technique to point himself in the right direction and then went from there.”

She knew all this. She knew when we were talking about luck, when we were looking at my character sheet together, when she was giving advice on what I should do, she knew and she didn’t tell me because she thought she knew better than me. I could feel myself starting to get angry with her, and again my mind went to the 2 POI on my character sheet. I didn’t know how that interacted with my WIS, but I was hoping that I could refrain from doing or saying anything just because I was upset with her. I didn’t trust myself to speak politely, so I said nothing.

“So you’re telling me that Anglecynn has been involved in widespread desecration of elfish burial grounds?” asked Fenn. “That’s the takeaway?”

“I think Larkspur probably missed his chance,” said Amaryllis. “But in case he didn’t, we should make for Weik Handum.”

So we teleported away, without another word, and I saved my accusations for later.

“I described the disease and its symptoms to a magus,” said Grak. “Given the information I was able to supply, he told me that it was murinae putredine, a rare and almost invariably fatal disease. I described the princess’ condition and he told me that she would likely die. His suggestion was that I find a unicorn. He said it as though he didn’t believe I would. He also said that a sufficiently skilled blood mage might have been able to burn the disease out through transfusion if it was caught within the first forty-eight hours. I did not find this helpful.”

“And that was your day?” asked Fenn. “Was I the only one who had a solo adventure?” She put a hand to her chest. “Oh my god, am I the real protagonist?”

“... you know that I ran into and had a scuffle with a Prince of Anglecynn and his cronies, right?” I asked.

“Sure, it sounds impressive when you put it like that,” she said. “But then you holed up in a hotel waiting for my adventure to be done, didn’t you?”

Amaryllis ‘wasn’t feeling well’ and had gone to her room to sleep some more, which I was slightly annoyed at, because I wanted answers from her, dammit, and slightly relieved, because it meant that I didn’t need to think about her being sick (and then I was a little disgusted with myself, because being relieved that a sick person is out of sight is a little shitty). We were going after the unicorn, that had already been decided before I showed up, and the plan hadn’t changed too much with my information.

“I will concede that I did spend a lot of the day in a very Earth-like hotel room,” I said.

“Sounds boring,” said Fenn. “Anyway, the archery contest was being held out on the bay, with little
buoys set up as targets, and they gave me a *full* handicap for elf luck, which I thought was really unfair, especially since there was a kashoonk there and he wasn’t given any handicap at all, even with biceps bigger than my thighs. I mean, it was more about accuracy than strength anyway, given the target values, but --”

“I don’t find this amusing, if that’s what it was supposed to be,” said Grak.

Fenn looked to me. I wasn’t smiling either. Maybe she actually had gone and entered an open archery contest, maybe even won it, but either way she was doing a bit that was only a little bit funny, and then only because of the contrast with our dire circumstances. “Tough crowd,” she said. “Okay, fine, I went to the athenaeum, poked about for a bit, and eventually found a *very* helpful raccoon who was willing to talk my ear off about what he called ‘blueprint theory’.” She held out a glove and a thick sheaf of papers appeared in her hand, with small little metal clips used for bindings. “This is a copy of his thesis on the subject, which he said I could borrow. It is, apparently, advanced stuff, quite a few years beyond what your average bone mage ever touches, because it’s not actually *useful* to know unless a bone mage drains their own bones, or at least the bones of something living.”

I took the papers from her as she kept talking.

“Anyway, the idea is basically that the soul has a blueprint of the body, and the bones are the scaffolding that everything hangs off of, with their own local blueprint copies,” said Fenn. “He kind of went on for a long time about whether ‘scaffolding theory’ or ‘blueprint theory’ sounded better, wanted to get my advice, that kind of thing, it was a very poor use of my time. He thinks that some healing works off what the scaffold says and some works off what the blueprint says. Like, I guess, if you had some shingles blow off your house, you’d know where you needed to put new shingles just by looking, right, because there’s nowhere they could go, but if a wing of your house got wrecked by a tornado you’d have to look at the blueprint to figure out how to rebuild. Sorry, I feel like I’m making a hash of it.”

“No, you’re doing fine,” I replied.

“Oh, good,” said Fenn. “But to get at the actual question, the problem seems to be that when you drain bones, you’re not affecting the scaffold, or not just, you’re actually fucking with the blueprint. So your finger gets hurt and asks the nearest bone, ‘hey, what should I do about this?’ but that bone is basically dead and doesn’t respond back, which means that the finger needs to go somewhere else and get an answer to the same question, which takes longer and maybe in the middle of this conversation things get screwed up because of the distance. That’s my layman’s understanding, anyway.”

“Alright,” I said, “So how do we fix it?”

Fenn coughed. “Well, there’s the rub. I asked that same question, and he first thought that it couldn’t be done, because if he’s right, this blueprint, or maybe these *blueprints* can only be seen by squinting your eyes at some of the evidence. Or so he said. *Most* of that evidence comes from draining bones, so it seems like it’s easier to fuck things up than fix them.”

“So you don’t have a quest for me?” I asked.

Fenn looked me over. “Okay, so there are two options,” she said. “Option number one is that you get new bones. Raccoon-friend thought that would probably work, if you got them from someone that was more or less like you.” She paused. “Anything?”

“No quest, no,” I replied.
“Alright, well I’m going to skip over all the reasons that’s a bad idea then,” said Fenn. “Option number two is basically that you get someone to fuck with your soul.”

**Quest Progress: Boneitis - The problem goes deeper than the bones, further than the heart, and straight into the very essence of your mortal existence. Find someone to alter your soul, or alter it yourself; either way, this is a project to approach with caution.**

“Yeah,” I said, “That would do it. Souffuckery … yay.”

“Is it really called that?” asked Grak. He’d been sitting quietly by the side, watching us, and I had almost forgotten that he was there. There was a thing that people did sometimes, where they said something just to be sure that they were heard, and Grak didn’t seem to have that instinct.

“No,” I replied. “The quest isn’t much of a quest, it’s just an update to the old one, with some warnings.”

“Yeah, warnings are probably appropriate,” said Fenn. “They practiced soul manipulation in the Second Empire, it’s kind of not a thing anymore, which means that if you find someone who specializes in it, they’re probably the kind of person you would rather run away from.”

“If you outlaw soul manipulation, only the outlaws will have manipulated souls,” I replied.

“Except not,” said Fenn, “Because most of what they did during the Second Empire was twisting innocent people around until they were barely recognizable monsters. And at the upper echelons they still use scraps of it, it’s not fully illegal, it’s just that the athenaeum was razed to the ground and pretty much everyone involved was killed.”

“Sorry,” I said, “That was a joke.”

“Boo,” said Fenn.

But that was a problem for another time, because tomorrow, we were going unicorn hunting (or rather, we were going to try to kill a unicorn that was hunting us).

“You’re a few miles into the woods when you spot the Unicorn for the first time,” I said.

“Any sign of the girls?” asked Tiff.

“I shoot it,” said Reimer, who was playing an archer/cleric, and who uttered the words ‘I shoot it’ at least twenty times a session.

“Roll for initiative,” I replied, “Tiff, no sign of the girls.” When everyone had given me their numbers, I gave them a description. “The unicorn is tall and shockingly white, not just with a horn atop his head that’s nearly two cubits long, but a billy-goat’s beard, a lion’s tail, and a cloven feet like a swine rather than a horse. Its body is that of an immense stallion, rippling with powerful muscles. Its pure black eyes look at the four of you, then it disappears behind a tree you don’t think could possibly hide its bulk.” I rolled some dice, then looked at my turn counter. “Reimer?”

“I can’t see it?” he asked.

“No,” I replied.

“Fine,” he replied. “Readied action to shoot it when it appears.”
“The unicorn goes just after you, and you see him step out from behind a tree that he, again, could not possibly have been hiding behind,” I said. “Fire your arrow.”

“18, hit?” he asked.

“The arrow flies through the air, but the unicorn’s horn has shifted position, and it knocks the arrow away with a loud snort as it charges in toward you,” I replied.

“Shifted position how?” asked Arthur. “Like, it moved its horn really quickly to knock the arrow away, or it did a teleportation effect, or what?”

“Roll Perception,” I said.

“22,” said Arthur.

“You realize that you have two distinct memory tracks,” I replied. “In one, the arrow was loosed from the bow and was about to hit the unicorn, but that memory ends before that would have happened. In the other, the unicorn moved naturally and fluidly to get his horn into position before the arrow was loosed.”

Craig rolled his dice around in his hand and frowned at that. “Okay,” he said. “So it’s like deja vu, but we remember it both ways.”

“Deux fois vu, I’d think,” said Tiff.

“So not precognition or supernatural reflexes,” said Arthur, “More like … reality warping.”

“Or timeline collapsing,” said Craig. “It sees that it’s about to get hit, then picks a timeline where it didn’t get hit, and merges with that one, dragging us along.”

“No, that doesn’t make sense,” said Reimer, “Why would we remember it? That’s not how the brain works. And anyway, this isn’t really helpful to us, because it doesn’t give us a clue about how to beat it. Do I think that it would be able to keep doing this to every arrow I fire at it?”

“I don’t know, do you?” I asked, which was my response pretty much every time he tried to weasel information out of me. “But anyway, that was your readied action, so it’s still his turn, and he’s charging right for you, horn out in front of him.” I rolled some more dice behind my screen, glancing at them only briefly. “His horn pierces straight through your metal armor, going through it like soft butter, and making a hole that punctures your shoulder. Again, he shifts away from you, and you have two memories, one of him charging and goring you, and the other of him coming to a stop next to you. His horn is bloodless and clean, but you are still very much injured. Take 16 damage.”

“Alright,” said Arthur. “This thing has stolen thirteen girls and killed twenty men, some of them supposedly better than us. We have some measure of it now, does anyone have any bright ideas how to kill it?”
The Feminine Mystique

We teleported into the Aon Adharc Glen fully armored and with weapons drawn. If not for the fact that a murderous unicorn was there, I probably would have found it pleasant. Birch trees stuck up from knee-high grass, with little yellow flowers poking up in small clusters and blue butterflies flapping their wings as they made their way through the forest. We were in a clearing, with the closest tree some sixty feet away.

Grak sprang into action while the rest of us stood with our backs together. He was drawing up a ward around us, circling at ten feet out. One of the things that Grak had done with his day was try to find out more information about unicorns, specifically with regard to warding. He was fairly confident that a ward against latent skin magic (i.e. skin) would work on a unicorn, so that was the one that he was drawing, but he gave us the caution that it was possible that because unicorns were an intensely magical creature our unicorn friend, as Fenn insisted on calling him, might either have skin which was fully imbued with unicorn magic instead of latent skin magic, or he might only have notional skin in the first place.

Killing a unicorn shared some surface similarities with killing a revision mage. With a revision mage, you basically had to ensure that they couldn’t revise backward to a point where they weren’t dead, either by killing them with something their magic couldn’t interact with, or by ensuring that no amount of revision or different action on their part could possibly prevent their death. The big difference was that timeline fuckery, or whatever the unicorn did, didn’t actually seem to care about magic all that much. It wasn’t undoing anything, just doing a sideways merge into a timeline where that thing hadn’t been done in the first place.

So that basically meant that we had to kill it in such a way that we couldn’t not kill it, no matter how many timelines it tried to merge together.

The good news was that Amaryllis had been rescued from a unicorn’s ‘care’ and then, when she was quite a bit older, read through the after-action report of that rescue. We were at least partially going off of what she remembered from that, though by her reckoning it had been at least four years since she’d read it, and she wasn’t terribly confident in her specific ability to recall fine details, because she hadn’t been reading with intent to memorize. The dual memories reported by the men sent to kill the unicorn were always within three seconds of divergence, which meant that all you really had to do was ensure that there was nothing that the unicorn could do within a three-second period to survive.

The bad news was that this power, or magic, or whatever it was, could be used an unlimited amount of times, and the unicorn had other abilities beyond just that big, annoying, deadly one. For example, it could slip behind trees and teleport around, which would allow it to close in on us from practically any angle. And while my normal response to the time fuckery might have been to just use poison (assuming I could figure out a way to administer it), that was all moot, because the unicorn’s natural healing conferred a complete immunity to poison and disease.

Grak finished the ward against skin and then came back to rejoin us with his axe drawn. We still hadn’t caught sight of the unicorn.

“You said that you were fairly certain that this unicorn hadn’t died?” asked Grak.

“Yes,” said Amaryllis. We had already gone over this back at Weik Handum, and it didn’t seem like she wanted to repeat what she’d said there. If there was no unicorn, then all we really lost was time. The existence of a unicorn in this glen wasn’t exactly common knowledge, and people with the resources and motive for killing this unicorn were also in short supply.
Fenn began moving before I saw anything, drawing an arrow from her glove, nocking it, and turning to track something unseen in the woods. My eyes caught a flash of white a moment later, but that was it.

“Elf luck still works,” she said. “That’s enemy contact, by the way.”

“Steady,” I said.

The unicorn came out from behind the closest tree to us, nine feet of equine somehow hidden behind a foot-wide birch. I wondered how that was possible, not just in the sense of this being a teleporting unicorn, but we had to have different perspectives on where it was hiding, right? And given that, there wasn’t just physical trickery involved, but visual trickery as well, because at any given time the four of us were looking at different parts of the unicorn.

Fenn loosed an arrow at the unicorn. I watched it sail toward him -- and then I had this other memory, one where he began moving just as Fenn let her arrow fly. He knocked it out of the air with his six-foot long horn and gave us a contemptuous snort that sent curls of steam into the chilly air.

“Well, that’s just like you drew him up,” said Fenn. “Good job, Juniper.”

(It wasn’t actually though. The way I had drawn him up, he had a version of Deflect Missiles that worked with his horn, and that was only once per round, plus a way for him to do the same to melee attacks, again only once per round. It was easy enough to overwhelm him or use area-of-effect spells against him, and the ‘new memories’ thing was mostly flavor because of the theme I was trying to go for.)

“He should be attacking,” I said, watching him. He was stationary, staring at the four of us. “You think he senses the ward?”

“He’s cautious,” said Amaryllis. “You can see there, on his flank, where they wounded him.” I looked to where her gloved and gauntleted hand was pointing and saw a thin, gray scar against his white hair.

“Shit,” said Fenn. “Doesn’t seem like that’s going to work in our favor. Should I shoot him again?”

“Let’s try the void rifle,” I replied. I unslung it from my back and took aim at the unicorn, which was watching me and occasionally stamping a cloven hoof. I was about to squeeze the trigger and shoot it before a thought occurred to me. “Is there any reason that it would just stand there and let me shoot it? Because my only guess is that it’s gathering information.”

“Could be taunting us,” said Fenn.

“I don’t know,” said Amaryllis. She was wearing her immobility plate, with helmet in place, and I hated that I had to go on the tone in her voice. This creature had kidnapped her and killed three of the people she was with when she was eight years old. “It likes its victims to know and understand that it has power over them, but … the three of you aren’t victims, you’re threats, obstacles.”

I squeezed the trigger on the void rifle, and watched as a dime-sized hole opened in the unicorn’s chest, and then there it was again, this alternate memory, where he had turned and darted back behind a tree. In the memory, I had tried to track and shoot him, but he had moved too fast for me, and my shot had put a hole in a tree instead.

He came at us from a completely different direction, charging at speed with horn down. He covered fifty feet in the space of a single second, and hit the ward hard, his horn swinging to within a few feet of us. And then, suddenly, we all had a new memory, one where instead he appeared behind a
different tree and simply stared at us.

“Okay,” I said, “He’s definitely probing us out. Are we confident in that ward?”

“For another two hours, yes,” said Grak. “More confident now than when it was made. He’s proven that it will stop him.”

“It’s not enough that we stop him,” said Amaryllis.

She was right. The condition for success, as stated by the quest, was that we had to kill the unicorn and have Amaryllis drink its blood. Sitting in a field with a unicorn staring at us for two hours until the timer on the teleportation key was up and we could leave wouldn’t actually accomplish anything.

Logically, the game had to have a way of implementing unicorn timeline fuckery within the game. I didn’t know how the game itself was implemented, but while simulating the entirety of Aerb seemed like a stretch, and simulating all nine thousand hells beggared belief, I was pretty confident that simulating actual alternate timelines was right out. It would be easier if the simulation was local to me, detailed only if my attention was directly on something, but if the Dungeon Master were going to cut corners like that, then there was no way that he would simulate a stupid number of timelines, especially since he was only really interested in the ones where the unicorn won.

My biggest question was whether the unicorn was getting information from the future or not. It was possible that if the unicorn got hurt, or was about to get hurt, or just wanted to, his mental state would get sent ‘back in time’ three seconds and he would get a do-over with more information. It was also possible that ‘time’ got rewound backward three seconds instead, and then events played out with different die rolls (or whatever), which would mean that the unicorn only got alternate timeline information when the merge happened.

These things weren’t functionally equivalent, not if there was a limit to plausibility/probability. If most of what the unicorn did could be summed up as ‘repeat the scenario until I win’ then you could never kill it, because something dumb and out there like everyone dying of random brain aneurysms could happen, or skilled fighters making rare flubs, or something like that. To make a D&D analogy, it would be like saying that you got to reroll the dice as many times as you wanted, which would mean that there was never a point where you wouldn’t roll 20s.

The solution spaces looked different depending on what we were dealing with. Maybe we didn’t need a death he couldn’t escape from, maybe we just needed a death he couldn’t escape from if there was no possibility that he had the information necessary to react to it.

“Okay,” I said. “We need to figure out whether the unicorn is getting information from the future or not. Maybe it is, or maybe it’s picking what actually happened from within a random set of things that might have happened.”

“And how, praytell, do we figure out which is which?” asked Fenn.

“Artillery shot,” I said. “His previous response to you firing an arrow was to wait and watch it come at him, then to use his magic to bring us into a world where he knocked the arrow out of the sky, right? He’s obviously really, really fast, we’ve seen that, maybe even fast enough that he didn’t need to use his power, but he probably can’t do the same for an artillery shot, because there would be too many arrows.”

“Only between eight and sixteen at this range,” said Fenn.

“You think he can parry eight arrows?” asked Grak.
“If he can, it’s worth knowing,” said Amaryllis.

“Okay,” I said. “So what I want you to do is to aim straight at him, wait six seconds at full draw, and then release. If you see him move at all, or you get the feeling through your elf luck that he’s going to move, then you release before the time is up, but only if it’s after three seconds have passed. Alright?”

“Uh, sure,” said Fenn as she thought about that. “You want to make sure that he can’t go back to a time before I had full draw. You’re trying to game it.”

“Yeah,” I said. This wasn’t actually a definitive test on whether the unicorn was actually getting future information, but it was as close as I thought we’d be able to get. I had a flowchart in my head for how this encounter would go, and information gathering was right where we wanted to be given that we didn’t get attacked.

“It’s me he wants,” said Amaryllis. I noticed a slight sway to her as she spoke.

“We have time,” I said.

Fenn nocked an arrow and pulled the bowstring back, closing one eye to sight along the grip. One mississippi. Two mississippi. And then the unicorn was off, back behind the tree and off somewhere else. Fenn turned to track him. One mississippi. Two mississippi. And again, he moved, darting back behind the trees. His movement reminded me more of a deer than a horse, in the way that he could spring forward or to the side. Maybe it was the agility that a cloven hoof gave him.

“Okay,” I said. “He’s smart enough to avoid getting in a situation where he’d have his options limited, he’s staying next to the trees so that he always has an out, and even then, he’s not staying still for long enough that he’d be faced with something inevitable. My guess is that he’s not getting future information, just information from the parallel timelines on merge, which means that all we really need to do is get him in a situation where he can’t see the killing blow coming.”

“The only reason it has to stick around is that it wants me,” said Amaryllis.

“Or because it can’t understand the teleportation key and is waiting for the ward to fade,” said Grak. “I would have to redraw it smaller.”

“Do you have something clever, Juniper?” asked Amaryllis.

I hesitated. “I have a vial of nicotine,” I replied. “If I drink it, then maybe with Ropey’s help I can grab onto the unicorn and --”

“Oh, are we entertaining idiotic deathwish scenarios?” asked Fenn. “Because mine is that I stab it in the throat, but I’m so good at stabbing it in the throat that there’s no possible scenario where it runs me straight through instead of just dying.” She turned to Amaryllis. “So that’s mine, and we know the princess has hers, Grak, did you have one?”

“With enough healing magic it might be possible to entrap the unicorn in a warped ward,” said Grak.

“No,” said Fenn, “It’s got to be something like Joon’s or Mary’s, where you’re putting all of the weight of the adventure directly on your spine.”

“I’m the one that’s dying,” said Amaryllis. She pulled off her helmet, and I looked at her sunken eyes. She had taken a shower and some magical healing, but that had only done so much. “I knew that it would come to this. We all knew that I was the key.”
She laid the helmet on the ground, and began walking forward, unarmed. The ward protected us, but not from the horn, and with three steps she was past the point where it might be able to gore her. Fenn began to raise her bow again, and I laid a hand on her arm to stop her.

“It’s me,” she said the unicorn. She walked forward with a trembling hand held out in front of her. Her voice was higher, more mellifluous than normal. “I’m your sweet little girl, your darling come back to you, still pure and innocent, still untouched by man, still unawakened to the pleasures of the flesh, that’s what you want, isn’t it? Your trembling, virginal, doe-eyed beauty returned, yours to capture again?”

(I felt my stomach churn at her words. The whole ‘innocent little girl’ thing had always left me feeling uncomfortable, maybe mixed with a little bit of shame. Part of that was Tiff’s influence over me. If she’d been here, she would have given me an earful about the male obsession with purity and youth. But that was the whole reason that I had made the unicorn in the first place.)

The unicorn leapt forward and charged at Amaryllis. I kept thinking that it would come to a stop, or at least that Amaryllis would try to dodge out of its way, but all she did was flinch a bit at the end, just before it drove its long, white horn straight through her armor and out the other side.

And then that was just an alternate memory of how things might have been, and the timeline we were in was one where it did come to a stop in front of her.

“Yes,” she breathed with a shaky voice, “You could kill me, thank you for showing me that, you’re so big and strong and handsome, that’s why I came back to you, why I’m here to let you take me away from these people, so you can use your big strong muscles and long, powerful horn to protect me from anyone who might try to defile me.”

The unicorn was semi-intelligent, but couldn’t understand English, so what she was saying to it was mostly to convey emotion and intent to it. She was a better liar than I gave her credit for; even with the overacted character she was putting on, there was something compelling about her words.

Again the unicorn moved in a flash of power and brought his horn down, thrusting it forward and spearing her through, and again the violence and gore, the shock of Amaryllis dead, became just a memory of a thing that never was.

“I know I was taken from you,” said Amaryllis, who tensed and then relaxed at the moment of integration, “And I know you’ve been lonely in this glen, because everyone keeps their daughters from you, but it was those mean men who took me from you, who whisked me away even though I clawed at the ground trying to stay with you. I was chaste and pure and modest while I waited until I could get back to you, back to the only creature that could ever protect me.” She took another step forward and rested her hand on the unicorn’s horn, then stepped forward tentatively, running gloved fingers across it.

Twice now it had gored her through and then made that only a memory, and I was tensed up waiting to see what the beast would decide. There was nothing stopping it from killing her for real, nothing except the fact that it had this intense, pseudosexual desire for her. I was worried that her armor would make her unappealing, or that it would smell the disease on her, or maybe just that she wasn’t pure and innocent except maybe in the sense that she’d never had sex.

But the unicorn allowed her to approach it, and she kept moving forward, down the length of its horn, until her hand met the ward against skin.

“Grak,” said Amaryllis, without looking back. “You’re going to need to remove this ward so I can be reunited with the unicorn.” Her voice was still the same, light and airy. She’d been careful with
her words since coming into the glen, and this was the critical moment.

“Will it stay with you if I draw a new one to protect us?” asked Grak.

“I can’t say,” replied Amaryllis. “You’re in his glen. He has every right to kill you. He doesn’t like

men.”

“I’m not quite a man,” said Grak.

“Whatever you do, do it quickly,” said Amaryllis. “We’ve been apart for so long.”

The unicorn moved backward just a bit as Grak slowly and cautiously made a second ward within

the first, but made no move to attack, or even to give us a memory of attack. It wasn’t clear how

intelligent the unicorn was, but I thought maybe he understood that we were going to release

Amaryllis to him. He certainly wasn’t smart enough to see the trap, or if he was, then his desire for

Amaryllis was strong enough to overwhelm any natural caution.

When the second ward, much smaller than the first, had been drawn upon the ground, Grak raised

his warder’s wand and swished it precisely through the air. The unicorn made the first move, closing

the distance between himself and Amaryllis until his muzzle butted up against her hand. She leaned

forward and gave it a brief, gentle, chaste kiss.

“It’ll be just you and me,” she said, almost too soft for me to hear, “I can help bring in more girls to

your care, I can bring them back to this glen with me, so that we can all be yours, together.” She

brought her head down to touch against the unicorn’s. Where her red hair touched its horn, it

changed, taking on a shiny, spectral quality. “Can I ride you?”

(I held my breath.)

The unicorn lowered its head until its horn touched the ground, and Amaryllis moved over to the side

of him. With a start, he sprang into action, turning toward her and bringing a foot slamming down on

her, stomping on her face, which was the only unarmored part of her. And then that was only a

memory, yet again, a memory that said, “I’m a nice guy, but I can and will fucking end you if you

betray me”. Amaryllis stopped, only briefly, at the unicorn’s side as the memory caught up with her,

and then she put a hand on his flank. He lowered slightly at her touch, and she climbed up with an

ease that spoke of experience with horses.

Amaryllis gripped him with her thighs and leaned forward to wrap her arms around his neck. She

whispered something in his ear, too soft for me to hear, but I was paying more attention to the count.

One mississippi, two mississippi, three mississippi.

“Now!” screamed Amaryllis, and the unicorn tried to move with a start, only to find himself locked

in place by the arms around his neck, the immobility plate rigid around him. And then there was not

one memory, but a cascade of memories, all of him trying to buck her and her clamping down,

locking her armor in place and closed tight around his neck.

I sprang into action. I faltered for a moment in the confusion of timelines, because I hadn’t sat there

counting, not in reality, I had been moving from the moment he tried to buck her and she had locked

him down. I raised my void rifle and aimed straight for center mass, trying to ensure that there would

be no possible reality where I hit her instead of him, and pulled the trigger.

Skill increased: Rifles lvl 21! (Skill capped at triple the value of primary stat CUN.)

New Virtue: Compensator!
There was another disorienting flurry of memories as the unicorn tried and failed to avoid the shot. A few things came to me at once, thought several times along parallel timelines, the first being that I’d been at 12 for Rifles, and I had memories of different messages coming up, which meant I was gaining skill from every timeline, and the second that the unicorn had to be iterating through timelines to find one that worked, trying over and over.

And still, the void rifle put a hole in him, just off-center of his chest, and I remembered times it had gone worse for him, when six inches of penetration had been enough to kill rather than just a wound that missed everything vital. It began to close almost immediately, and within a second it was just a grey dot.

Grak dropped the ward as Fenn moved around to the side, darting with the speed of her armor and then lining up a shot carefully. The unicorn began throwing its head back, trying to smash into Amaryllis, and I could see her jerk from the impact, but almost all of its force went up against her armor, which wasn’t going anywhere. The memories were coming thick and fast now, and I was having trouble keeping track of what was and wasn’t happening. I laid a hand on a bone sticking out of my bandolier and started draining it for SPD, and popped a snake from my wrist tattoo to slither across the ground, as I went to join Fenn.

**Skill increased: Bone Magic lvl 21! (Skill capped at triple the value of primary stat KNO.)**

**Skill increased: Skin Magic lvl 21! (Skill capped at triple the value of primary stat KNO.)**

When Fenn shot, I must have lived the same slice of three seconds a few hundred times. She had been moving as far away from the unicorn as possible, and when she shot the arrows split, then split, then split, and I had a wash of memories of it happening, arrows driving deep into the unicorn’s flank. The true reality we ended up in was six of them in the unicorn and another two in Amaryllis’ leg, the odds against that astronomical but still not enough to save the unicorn.

It slowed down, huffing and rearing frantically, occasionally tossing us across into another timeline, giving us memories of things that had happened in just slightly different ways. Amaryllis was bleeding from her face, battered from where he’d managed to hit her just so, but she grit her teeth and waited there as we hopped between realities and the unicorn wore down, until finally it sank so that the front half of his body was supported by the lock Amaryllis and her immobility plate had around his neck.

**Unicorn defeated!**

She dropped unceremoniously and rolled for a bit, then gasped in pain and moved over to the unicorn. Amaryllis ripped one of the arrows out of its side, ignoring her own wounds, and pressed her lips to where metallic blood was trickling out. I moved over beside her and took a small cup Fenn offered, trying to scrape up more blood from the unicorn’s other wounds. When I offered the cup to Amaryllis, she drank deep, guzzling it down, leaving her lips and teeth stained with the silvery fluid. The arrows in her leg popped out, the cuts and fractures of her face healed, and then, with a trembling hand, she removed her glove. Her hand, previously yellow, was now as pretty and perfect as it had ever been.

She looked at me with a maniacal grin on her face, and that was when I noticed that her pupils were crazily dilated, giving her a look that might have been cartoonish if not for the blood (hers and his) all over her face. She reached toward me and gripped me on the neck, then pulled me in for an uncomfortable kiss, with her lips mashing against mine and our teeth clinking together.
When she pulled away she rose from her knees and raised both fists in the air for a scream. “Woooooo!” She pointed down at the unicorn. “Fuuuuck you, fuck you, stupid fucking horse!”

*Quest Complete: Unihorn - The unicorn blood has purged the disease from Amaryllis and cured all the damage it had done. Don’t worry, the high won’t last longer than 1d4 hours.*

I braced for the level up, but it didn't come, and I felt my heart sink at that.

“I feel SO FUCKING GOOD!” shouted Amaryllis as she started to remove her armor. “Did I always feel this good?” she asked, speaking fast and not waiting for an answer. “No, no, I never felt this good, this is the unicorn juice talking, but FENN, do you want to go for a naked run through the woods with me, because I’m not going to die anymore and it’s probably a good idea to try to burn off some of the unicorn blood inside me so that I can get my head on straight and Juniper I’m sorry I kissed you but I knew you’d been wanting me to --” She stopped and struggled with one of the straps on the immobility plate, flailing around with it for a bit.

“Well now I kind of want to try it,” said Fenn. “But we’re going to need at least two people with their heads screwed on straight. Joon, you’re up.”

I looked down at the unicorn corpse and then did as Amaryllis did, pulling an arrow from the unicorn’s side and then sucking at the wound. I’d already had some of the taste when Amaryllis had kissed me; it was metallic and slightly bitter, not the ambrosia I would have been expecting. I didn’t really think that this would do anything for my bones, but not even trying didn’t seem like an option, not even with the psychological reaction that Amaryllis had. Fenn was at my side, watching me carefully as I drank, and before I knew it she had thrown me backward and climbed up to sit on my chest.

I was waiting for it, and could feel the effects start to rip through my mind, holistic integrity thresholds on my personality network be damned.
I came to in a warm bed. The last thing I remembered was planting my mouth on a unicorn wound and sucking out its blood. No, there was something after that, Fenn putting her weight on my chest and smiling, that was it. When I looked over, I saw her in bed beside me, curled up and looking content.

We were back at Weik Handum; I recognized my room. I was out of my armor, which was piled on the floor beside me, along with the rest of my gear. I couldn’t help but notice that I was in just my boxers, and when I pulled back the covers, I saw that Fenn was topless, which set my heart beating faster. I looked at her, trying to work out what had happened in the gap between drinking the unicorn blood and ending up here, and then just looked at her without thinking too much in particular.

When she began to stir, I averted my eyes. I could see through the light in the hallway that it was just barely sundown.

“How are you doing?” she asked, slurring her words slightly as she woke up. “What time is it?”

“I’m fine,” I said. “I think maybe you just went to bed?”

“Seems right,” said Fenn. “It took us some time to deal with the unicorn, Grak and I. Too big for the glove by about a foot, and that’s not including the horn. It’s got white guts, come to find out.” She sat up and stretched out, then looked down at her chest. “Does this bother you?” she asked.

“Not really,” I replied, but I could tell I was blushing, and that ‘bother’ wasn’t the right word. “I’m going to have to adapt to the cultural norms of Aerb sooner or later. It’s no big deal. I’ll get, um, desensitized.”

“You and Amaryllis both said some things,” said Fenn.

“Oh?” I asked. I rubbed my head. I wasn’t feeling at all hungover. Whatever the effects of unicorn blood had on my mind, it didn’t seem to have any aftereffects at all, aside from the blackout.

“I mean obviously I’m not going to tell you what those things are,” said Fenn with a laugh. “Grak might tell you, I guess, even though I swore him to secrecy. He did not, not at all, like being tasked with caring for Mary. Eventually he just put up a ward around her to keep her from running off, and then another ward to muffle the sound.”

“And me?” I asked.

“You seemed happy enough to be sat on,” said Fenn with a grin.

“Um,” I said with a swallow. “Did we …” I trailed off as I looked at my clothes on the floor.

“Did I rape you while you were high on unicorn blood?” asked Fenn with a scowl. “Come on, you know me better than that.”

“Yeah,” I said, “Sorry, I just … I never got drunk, back on Earth, the feeling of blacking out is unsettling. I always thought it was conceptually unsettling. Not knowing what was said or done by this person who wasn’t really me … and I mean, I thought maybe that if I had said something to you, or tried something, and without knowing what the Aerbian cultural norms even are in that, ah, regard --”
“Not something I really want to talk about right now,” said Fenn. “Let’s just say that I’ve been on the other side of that fence once or twice, though gladly never to the extent I couldn’t handle myself.”

“Ah, so you’ve gone unicorn hunting before,” I said.

Fenn gave me a weak smile. “It’s been a long day for me. Lots of talking to Grak, which takes its toll, and lots of talking to, let’s call him, Kuniper. We’ll move a letter down the alphabet every time you get hopped up on the blood of a different animal.”

“And you won’t tell me what I talked about?” I asked.

“Honestly, you mostly talked about things that didn’t make any sense to me,” said Fenn. “A lot of it was about Dungeons & Dragons. You spent twenty minutes delivering this monologue on something called a candle of invocation?”

“Huh,” I said. “That doesn’t sound so bad. I mean, boring for you, but not actually that bad.”

“There were other things,” said Fenn. “Little tidbits.”

“Tidbits you’re going to torture me with?” I asked.

“Tease, not torture,” Fenn corrected. “What else are companions for?”

“Ah,” I said. I prodded at my left hand with the index finger of my right. “The unicorn blood did nothing for me, by the way.” It hadn’t even topped me up on blood.

“Well it was still a fun time for all involved,” said Fenn. “Look, can we talk about this in the morning? As much as it’s good to have my Juniper back, I really do need the sleep.”

“Sure,” I said, feeling my cheeks grow warm at the possessive, ‘my Juniper’. “I’m going to go grab some food.”

Fenn laid back and closed her eyes, while I threw on some clothes. As I did, I noticed that all of my snake tattoos were gone, another apparent casualty of whatever Kuniper had been thinking. I looked back to Fenn before I left the room, and wondered whether her state of undress was because of something I’d said to her. Had I told her that I missed seeing her naked? Had I said that I missed when she was more flirtatious? Those both seemed like things I would plausibly say if I were deprived of my inhibitions.

I tried to think of the bluntest possible true thing I might have said, and then winced, because it would be something like a breathless, “I think you’re pretty and sexy and fun and I am sort of a little bit in love with you, and I asked the One True God of this place to make you real in case you weren’t already because you’re also my best friend”. I wasn’t sure whether it would be better or worse if I had then added any qualifiers or clarifications. But that wasn’t even the worst case, because it might have been that I’d said something false, and that was a problem space too large to bear thinking about. I would have to talk to Grak and get him to break his silence; I didn’t actually believe that Fenn had sworn him to secrecy.

When I came into the main room, the fire was crackling away. Amaryllis was sitting on the couch next to it with her legs tucked under her. All traces of blood had been washed from her face, and from her damp hair I gathered that she’d recently taken a shower. She was barefoot, wearing shorts and a simple t-shirt, with a mug of something steaming cradled between her hands. She really was shockingly beautiful, almost enough so that I might be able to forget that I needed to call her out on a few things. I sat down across from her, which drew only a brief glance before her gaze returned to the fire.
Then I read her shirt and started laughing. It said ‘Born to Bone’ on it, with the crest of the Athenaeum of Bone and Flesh beneath the lettering.

“All of my clothes are in Fenn’s glove,” Amaryllis explained. “She got this for me while we were in Cranberry Bay. I knew that I would rue the day I gave that glove over to her.” She turned to me with a small smile, but I was still laughing, because Fenn was in charge of her wardrobe and I had to believe that this was just the opening salvo. “Alright, settle down.”

“Sorry,” I said. “Just thinking about what else she has in store for you.”

Amaryllis nodded in acknowledgement, then was silent for a moment, long enough that her smile began to fade. “I’m given to understand that I kissed you. I apologize for that.”

“No worries,” I said with a wave of my hand. I remembered that kiss with a slight unease. It had been the wrong moment, and she’d kissed me frantically, sloppily, like I was the first person she’d ever kissed and she wanted it to be the kiss to end all kisses. I hadn’t enjoyed it. Maybe the taste of mingled human and unicorn blood had something to do with it. “You actually said that you were sorry right after it happened, that’s one of the last things I remember.” But what had she said? She’d said that she thought I wanted it, not that she wanted it.

“How was it?” she asked, keeping her tone light.

“Er,” I said, not sure where this was going, and feeling uncomfortable. “It kind of reminded me of my first kiss.” The silence stretched, and I rushed to fill it, as though that needed explanation. “Freshman year I went to this party and sat next to Alicia Aaron for like three hours, and then she offered me a ride home with her parents. When we got to my house I leaned over and … yeah. It was … I don’t know.” Not great? Good only because I’d been lusting after her for a few months? And then we had one date, and she told me over the phone that she didn’t want to go out with me.

Amaryllis turned to the fire and watched it for a bit as it crackled away. “We need to talk about the future.”

“The future of you and me?” I asked.

She turned to me and raised an eyebrow, like I was a complete idiot, which might have been fair. “I meant the future of this group,” she said. “Fenn tells me that you want to go find the Lost King.”

“Oh,” I said, feeling my cheeks flush. Of course she didn’t want to talk about our future. I felt like when I had seen her I’d had a plan, and now that plan was melting away. What was it? Oh, yes, she’d just said, the Lost King. “Did you know that Uther Penndraig was dream-skewered?”

Amaryllis was never terribly expressive, unicorn blood aside, but now her face set into almost complete blankness. “I suspected,” she said. “Even before I met you, I suspected. The Athenaeum of Speculation and Scrutiny has seen perhaps a thousand of the dream-skewered, but that doesn’t mean that there were only a thousand. If a thousand ended up cataloged, how many died before anyone figured out what had gone wrong with them? And more rarely, how many ended up being good enough at hiding their unfamiliarity with the world to scrape by, build a life here, and never reveal what they remembered of Earth to anyone? There are theories, in the athenaeum, about how one of those people might be spotted. Those who are familiar with the phenomenon have theories about what historical figures might have secretly been dream-skewered.”

“And something made Uther stand out,” I said. “Words he said, idioms he used, something like that? Or was it the songs, plays, novels, all with a peculiar variety of themes and ideas, as though he was plagiarizing from a whole culture?”
“Once you have the idea in your head, it’s hard to get out,” said Amaryllis. “Everything starts to look like evidence of it. Foreign ideas about how a people should be governed, the very occasional misstep that looks really odd if you don’t have the ready explanation that he went in blind, bits of language that don’t match his contemporaries … it was, in a way, obvious.”

“But it’s not accepted,” I said. I felt my fist clenching. She had known, and decided not to tell me. “Was it swept under the rug by the athenaeum, or his heirs, or what?”

“There were too many holes in the theory,” said Amaryllis. She took a sip from her drink. “I made myself a buttered coffee, did you want one?”

“No,” I replied. No, I don’t want a diversion.

“There were too many coincidences,” Amaryllis continued. If she saw my tenseness or heard the edge in my voice, she wasn’t reacting. “It would be one thing to say that a genius at magic, combat, politics, science, and the arts was dream-skewered, that might eventually happen given enough time. But he wasn’t just that, he was the secret heir to a kingdom, last of a line everyone thought was wiped out, and if he was dream-skewered, then it seemed awfully convenient that everyone who had known him in his old life and could give him away was wiped out by the Dark King. And of course, he would have had to go his entire life without letting on to anyone, even those close to him. He would have had to be a nearly perfect liar.”

“And then you met me,” I said. “And you realized at some point that the explanation for what happened to Uther was standing right in front of you. History was repeating itself. You must have figured it out when you saw my reaction to hearing his story, when I asked you what the Lost King’s name was. You knew then, and you didn’t fucking tell me.”

“You’re angry,” said Amaryllis, keeping her voice mild and light. I felt the urge to go over and slap that serene beauty right off her face.

“I had a right to know,” I spat. “He was my best friend in the world. He was everything to me.”

“I … I didn’t know that,” said Amaryllis, for the first time seeming somewhat fazed. “I thought there was a connection, but --”

“So you said nothing, because you wanted me to be easier to control,” I replied. “You wanted me to be without my own stake in the world, tied to you and your quest to regain power. Or, or you wanted something to dangle in front of my nose at the right time, a hint at the truth if I ever pulled too hard on my leash.”

“Is that what you think of me?” asked Amaryllis. Her mask was breaking now, alarm and surprise seeping out from behind it, but I couldn’t trust that either, because maybe it was just part of the ploy, part of her plan to get me back on track.

“I asked you about luck and you told me only half of what you know,” I said. “Why? The only reason I can figure is that you wanted to make the option less attractive to me.”

“Have you stopped taking anything I say at face value?” asked Amaryllis. Her voice was still mellow, but she was speaking faster and louder than before. “Revealing state secrets is a crime punishable by death in Anglecynn, and there are already solid grounds for a conviction on that count given that I told you about a strictly confidential research facility. There are enough things that I’m going to have to sweep under the rug already, and --”

“And you didn’t think that luck was worth it,” I cut in. “You wanted me to pick wisdom.”
Amaryllis calmly and steadily set her mug on the arm of the couch. “Joon, did you save my life less than twenty-four hours ago just so you could yell at me?”

“I’m not yelling,” I said. I made a conscious effort to lower the volume of my voice. “I need you to tell me everything that you’ve been holding back until now, state secrets or not, even if it’s embarrassing, even if it makes you look bad. Start with Uther Penndraig.”

Amaryllis looked me over. “I didn’t know that he was that important to you,” she said. “You never said a word about this friend, and you never mentioned the connection between the two of you. Communication happens between two people, not just from one person to the other. What would you like to know?”

“Did he ever mention me?” I asked. I wanted her to stop being so damned reasonable. I had puffed myself up, and I could now feel myself deflating. It was easy enough to be angry, I had more than enough experience with that, but not when she was sitting there and calmly answering my questions.

“He planted a number of juniper trees,” said Amaryllis. “So far as I know, he never uttered or wrote down your full name, and I haven’t been able to think of any cleverly coded references hidden in his deeds or works. If you find one, will you trust that I didn’t know about it?”

“No,” I said. “Why would I?”

“Joon, there are things that I didn’t tell you, but I have never, to my knowledge, lied to you,” said Amaryllis. She unfurled herself from where she sat on the couch, the first time she’d moved since I sat down. “You have a number next to my name that displays my loyalty, don’t you?”

“I do,” I sighed. That was the biggest point in her favor, the one that I had been ignoring in order to keep the flame of anger lit. “The problem is, I don’t know how loyalty is defined within the game, and it’s possible there are hidden loyalty numbers for other things. Maybe your loyalty to the throne of Anglecynn is at a twenty, and until your loyalty to me passes that, I’ll always come second.”

“Is that something that you would want?” she asked, gently placing her hands on her knees.

“No,” I said. “Maybe. It depends on the nature of the conflict. I wouldn’t want the game to overwrite your values, but I’d want you to … I don’t know, to not stab me in the back.” I paused. “I’m sorry I yelled earlier.”

Amaryllis shrugged. “I’m surprised that you’d be willing to offer an apology at all. You were right to be upset, I haven’t been forthcoming. There’s one more thing.” She reached into her pocket and pulled out the teleportation key. “Do you know how a teleportation key actually works?”

“In what sense?” I asked. “The fact that I’m asking probably says that I don’t know.”

“Most people assume that you think about a place and then you go there. That was the assumption you made. I never corrected you. What it really does is show you a green line, that traces through every place you’ve ever been,” said Amaryllis.

“Okay,” I said slowly. “Oh. You didn’t want me to see the places that I had been, in case it would give me some clue as to the person I had been before the skewer. That’s underhanded, but I don’t really have any connection to, um, whoever that person was. It would be interesting, I guess, but,” I shrugged. I was missing something, I could see that, but whatever her perspective was, I wasn’t able to see it. “Did you think that it would show Earth?”

“I thought there was a chance. The Athenaeum of Mathematics and Metaphysics teaches something called conditional probability,” she began.
“We have that on Earth,” I said. “So, multiply the chance that the teleportation key actually shows my worldline as tracing back to Earth by the chance that I would choose to use the key to return to Earth … and then I suppose multiply that by the teleportation key’s value to you, which has to be stratospheric, and yes, I can see where you would think of that as an unacceptable risk.”

“‘Worldline’,” said Amaryllis. “You have that on Earth?”

“As a matter of theory, sure,” I said. I had used it in a game once, as a novel form of scrying where the people were represented as days-long fleshy snakes.

“Well, it wasn’t just the chance that you would leave,” said Amaryllis. “If you saw a line leading back to Earth, however the key would display that to you, then it would always be at the back of your mind. Even if you chose not to abandon me, then you would have made that choice, and in your mind I might owe you something for it.”

“So you’re saying that you thought a lot about it,” I said, shifting in my seat. “I mean, at least you’re not just casually lying to me, at least there’s some thought being put into when to lie.” She had the good sense not to point out that it wasn’t technically a lie. I frowned. “That doesn’t actually make me feel much better.” I looked at the teleportation key. “Did you think about the other possibility? Or, I guess, the more interesting of the two other possibilities? Either the worldline starts in mid-air, right when I came to on the plane, which isn’t very interesting at all, or it traces back whoever this body belonged to. I don’t necessarily want to know if I replaced some poor idiot who was going to be executed, but --”

“But Uther Penndraig was the secret heir to the throne of Anglecynn, and if your life is a mirror of his, then who might you be?” asked Amaryllis.

I hadn’t actually thought of that.

“You thought that was a possibility,” I said, “But you kept it from me.”

Amaryllis handed the teleportation key over, and I took it from her, turning it over carefully. “I’m sorry,” she said. “Do you understand how nervous I am to see that key in someone else’s hands? I don’t understand how you don’t feel raw terror at the sight of me holding the key. It would be so easy to just leave, to put everything behind and abandon it.”

I shrugged. “I’m more trusting, I guess. Or maybe more accepting of my fate. If you left us here in Weik Handum, that would be horrible, but I would figure something out.”

Or maybe I’m not more trusting, just less afraid of being abandoned. Amateur psychology powers, activate!

“Are you going to see where it points you?” asked Amaryllis, studiously not keeping her eyes locked on the teleportation key. “Don’t push too hard or you’ll leave me. Us.”

“Sure,” I said, though I wasn’t at all hopeful that it would take me back to Earth, if I even wanted to go there. The life I’d left back there wasn’t all that great, though it did have the benefit that no one was trying to kill me. If I saw a worldline that led back to Earth, back to fifth-period English, what would I even be going back to? Tom and Reimer were the only people left in our D&D group, mostly because I’d fucked things up with pretty much everyone else. I’d been trying to mend things with Tiff, and it had almost seemed to be working, so I guess there was that.

And if I did get back to Earth, it would almost certainly be just a simulation of Earth, but then I had to start thinking about whether or not it was likely that I would keep my powers, and what my life would be like if I did, and all sorts of other considerations like whether magic would work there too, and in the end it made a lot more sense to just check whether any of this actually needed thinking
When I closed my eyes, the teleportation key presented me with a field of small yellow dots, and littered among them, a handful of green ones, with a single green line. I waited three seconds for the character sheet to pop up, but apparently the game was smart enough to not interrupt me (or possibly, this was the same interface that the locked-away fast travel system used, which was how I might have done it). I almost asked what the yellow dots were, but I figured it out on my own; I had seen a map of Aerb’s forty-four continents, with all the major cities marked, and it was clear that the yellow dots would overlay the cities almost exactly. Those, then, were the touchstones.

That meant the green line there -- and when I looked at it, the view zoomed in. With a thought I could rotate it, not just on the x and y axes, but on the z axis as well. I started looking at it from one end, what I thought had to be Sorian’s Castle given the vertical distance it traveled. The interface had no legends, and didn’t show any buildings or terrain. All there was to go on was the worldline, the path that I had traveled along in what I decided I was generously going to call my adventures. Down the elevator, wandering through the city, into the sewers, then across the Risen Lands on soulcycle, moving back in time along the worldline.

I could tell the places I had spent any amount of time, because there the line got knotted up, tracking me as I stopped to go to the bathroom, or scrounge around for food, or sat and talked with Amaryllis. The teleportation key had a frankly absurd interface from a usability standpoint, but once you knew about it, I was pretty certain that there were steps you could take to make sure you got where you were going. Find an obscure spot, then walk around in a spiral, and that would serve you well enough as a marker.

I finally found what had to be Comfort, and the looping line that traced my path through it, with more squiggles at the mechanics and the clothing shop where I’d met Poul. And then I moved backward again, until I got to the gas station and the sight of my first kill, and back more, until I was tracing the line up into the air, a nearly vertical drop. I backed up the view and followed the mostly-straight line until it touched down on the ground, and here there were unfamiliar squiggles that must have been when I was loaded onto the plane. I stopped and paused there, because I wasn’t loaded onto any plane, someone else was, which meant that all that thinking about a return to Earth was moot.

I kept following the worldline though. There was a pattern to it, with long, mostly straight lines, then lines overlapping each other but always on a grid. Institutional living? Had this body belonged to a criminal in prison? If so, the pre-Juniper had been moved around a few times, because the pattern was largely the same three times in a row.

And then I got to the other end of the green line, to a place I imagined was probably on the scale of a small town, where the lines were so thick it very nearly traced out a full-fledged map. A single place dominated all the others, a cluster of lines, no, the same line, traced over the course of a decade and a half. This was where he lived.

**Quest Accepted: They Say You Can’t Go Home Again - He had a life, before you, and you had a life, before this.**

I stared at the words, then opened my eyes. Amaryllis was looking at me.

“You were in there a long time,” she said. She shifted slightly. “May I have the key back?”

I handed it back to her. “No Earth,” I said. “I did find his home though, the person who got dream-skewered. I got a quest to go there, I think.”
“We can’t,” said Amaryllis. “You know that it’s too dangerous.”

“I know,” I said. “I don’t want to go there. I don’t know what the point would be. If his parents still live in his childhood home … it seems cruel to me.” I looked down at my hands, then at the freckles on my arm. I’d had those freckles for as long as I could remember. I had a memory of Tiff touching them one night while we were on her rooftop looking at stars, telling me that they were like Orion’s belt. This body had those same freckles.

“Are you okay?” asked Amaryllis.

“Yeah,” I said, “Just thinking.”

She nodded and gave me some time, which I mostly spent on thinking about the simulation and what it was trying to tell me, if anything. Was it admonishing me for being here? I hadn’t chosen to replace this random guy, none of this could be laid on my feet. And if we shared the same body, down to the placement of random hairs, then wasn’t that what he was destined for? Or were my memories only dreams, built to conform to the body I was placed into? I wanted to scream at the Dungeon Master and tell him to just stop fucking with me already.

“Are things going to be okay between us?” asked Amaryllis.

“Yeah,” I said. “I’ll get over it. Unless you’re hiding other things.”

“I was fairly high up in our government,” said Amaryllis. “I have a lot of secrets. There’s nothing that I think you need to know though, and no place where my silence would be damaging to our partnership, at least to my knowledge. I do, honestly, want to rebuild from here.” She paused. “And I’m loath to do it, but we will need to talk about the future and what our next steps are going to be. In the morning might be best, with the others around. We can bring it to a vote.”

“Sure,” I replied. “I’m going to try to get some sleep so my schedule isn’t thrown completely off. We’ll talk in the morning.”

I wandered back to my room, feeling a little bit out of sorts. I hadn’t handled that conversation well. I kept replaying it in my head and thinking of what else I should have said, how else I should have phrased my displeasure. Maybe it was the fact that it was Arthur at stake, that she had known he was in this world and kept him from me. There was a part of me that distrusted her for how she had handled me, as though a fight where we’d both been yelling would have been more honest. That was how my parents had always settled matters. I felt like I was the bad guy, and she was the one that had been trying to control and manipulate me from the start.

I was mildly surprised to see Fenn in my bed and remember that she was sleeping there. I took off the clothes I’d put on and climbed back in next to her, then spent a long time staring at the ceiling, thinking.
Tiff had taken to driving me home after D&D. She didn’t live anywhere near me, but she’d said she lived so far out in the country that the extra few miles didn’t matter to her, and I naturally accepted the rides, because she was Tiff.

“I have a question about the unicorns,” she said.

“Unicorns in general?” I asked.

“No, your unicorns, the creepy rape monsters,” she said.

“They weren’t actually rapists,” I said. “Just, rape adjacent. And that was a long time ago, so I’m not sure that I’m going to remember anything.”

“Well, you can make something up for me then,” she said. “The thing was, I kind of didn’t get the time powers.”

“Oh,” I said, “So, the unicorn kind of merges alternate realities to put himself in a position --”

“No, sorry, I mean I get how it physically works, or at least I think I do, I just don’t understand why that’s a power that unicorns have,” said Tiff. I watched her as she kept her eyes on the dark road ahead of us. Her brow was furrowed in concentration, which was one of her most attractive looks. “Not to pull back the veil too much, meaning don’t tell Arthur that I asked, but why did you give them time powers? I thought it was just random, but you usually don’t do random.”

“Eh, it’s dumb, and we didn’t really do anything with it,” I said. “Cutting room floor type thing, happens a lot.”

“You may proceed,” said Tiff, in her best impression of a Star Fleet captain.

“So, I had the unicorns as like this hyper-masculine, purity obsessed, possessive creature, right?” I asked. “That much came through?”

“Yeah,” said Tiff. “I really liked it.”

“Well, the time powers were supposed to be more about manipulation and gaslighting,” I said. “Like, I had this idea of the unicorn as this abusive guy who just beats and abuses his wife or daughter and then pretends that nothing happened, or says that it’s only because he loves them so much, or … whatever. It was more about making his victims question the nature of their reality, I guess?”

“Okay, but we rescued the girls, and you said that they seemed fine,” said Tiff. She pulled up to my house, an unremarkable blue rambler with a pair of trees blocking most of the windows from sight. It was late at night, and all the lights were off.

“Yeah,” I said, looking at my house. “I chickened out. We were getting toward the end of the session and I just, didn’t really want to have this messy, complicated ending that was going to bring everybody down.” I made no move to get out of the car. “I used to do those a lot, and I think I was the only one who enjoyed them, because it was like, that’s how the real world is, things don’t have these nice conclusions, and sometimes even if you save someone they’ve got issues that, maybe don’t scar them exactly, but that they’ll have to work through on their own. There’s not always a panacea.”
“Don’t want to go in?” asked Tiff, after I kept looking at my house for a bit.

“Eh,” I said. “Church tomorrow. Dad’s stopped going and it’s always,” and then I stopped there, because I didn’t really see the point in continuing. I’d been wishing that my parents would just get a divorce for the last few years, but it didn’t seem like either of them were at their breaking point yet.

“Did you want to spend the night at my place?” asked Tiff. I turned to look at her. She was barely visible under the reflected light of the car’s headlights.

“Yeah,” I said. The car started moving again, and I only took my eyes off her for long enough to send my dad a text I knew from experience he wouldn’t read until the morning, keeping the details vague. “Are your parents going to be okay with that?”

“They’re in Toulouse for the week, so I’m all alone,” said Tiff. She cleared her throat. “I don’t want you to think that this is, like, a thing. I mean, I know that your parents are being, whatever, and we’ve been going late so you can avoid them. Just, remember that it’s a position of vulnerability for a young woman.”

“Ah,” I said. My heart was beating faster and my breathing was a little deeper. Tiff had just invited me to spend the night with her, with her parents gone, and she didn’t want me to think that this was ‘a thing’, but everything in my teenage boy brain was screaming that if I ever had a chance with her, this was it.

Whatever my troubles at home, there suddenly wasn’t space in my brain to worry about them anymore.

“I’m really horrible about signals,” said Tiff. “I get that, about myself. But it’s so embarrassing to just plainly say things, right?” She was normally more articulate than this.

“Yeah,” I said. “Or, no. Embarrassing isn’t the thing I feel. For me it’s like I’m walking through this minefield and I get really tense because it feels like one wrong step is going to get me blown up.”

We drove in silence for a bit as we made our way out into the country, past the occasional too-bright reflective sign.

“I don’t want to make things weird between us or in the group, but I have a huge crush on you,” I said. I’d rehearsed that in my head three or four times in the silence, and my chest felt like it was constricting as I said it. “I just, thought you should know, because maybe it would be easier for both of us if I didn’t spend the night, so I’m not torturing myself thinking about the minefield.”

“Oh,” said Tiff. There was a long pause. “Well I like you too.” There was another pause, as a wild grin began spreading across my face. “I like you.”

“Well,” I said. “Good. Good to know.” I was sure that my smile could be heard on my voice. Relief was washing over me, because I had stepped out into the minefield and not gotten my foot blown off, or at least, not yet.

“When I say that I don’t want to make this, tonight, a thing, I mean,” Tiff was speaking quickly, her voice unsteady. “I mean there are certain assumptions that a boy might make if a girl invited him over for the night when her parents were gone, especially if they’d just confessed their feelings to each other. And I don’t want you to think, not that you would, that this was a proposition of some kind, or a promise on my part, that asking you over is consent of some kind.” She let out a breath. “See? Just incredibly embarrassing. I feel like I’m going to melt.”

“You’re saying I shouldn’t try to kiss you or anything,” I said. My heart was flopping around in my
chest like a fish out of water, because the ground still felt unsteady. Was it enough that she liked me? She hadn’t said that she wanted to go out on a date, and I hadn’t asked her, and I could think of plenty of reasons why it would be a bad idea, like what things would look like if it didn’t work out, and the fact that Arthur had the biggest crush in the world on her -- everyone knew that, did she know that? I had no idea how I would explain things to him, if Tiff and I ended up, impossibly, as a couple, something I’d been fantasizing about for months but never whispered a word of to anyone.

“It’s more the ‘or anything’ I was thinking about,” said Tiff. She cleared her throat. “You could try to kiss me.”

So I spent the next five minutes of our trip trying to surreptitiously see whether my breath was still fresh, to make sure my lips weren’t chapped, to think about everything I knew about kissing (not much), to plan and strategize and run scenarios in my head until I was almost dizzy.

And then when we pulled up onto the dirt patch that served as parking, I got out and went around to her side, where she was waiting for me, with her chin tilted up and her lips slightly parted, and maybe it was the anticipation of the car ride, or the warmth of her mouth in the cold night air, or the prospect of not just spending the night together but all the nights that might lie ahead of us, but kissing Tiff somehow managed to not just exceed my expectations but transcend them, so I forgot that I even had expectations.

And then we kissed some more in her house, and she took me onto the roof where we looked at stars in the cold, and I kissed her on the head from time to time, because that was a thing I could do now. I didn’t try to go any further than kissing, not even when I could feel her pressing her body against mine as we kissed, or her shaking hands touching my neck as my tongue entered her mouth.

She gave me a ride home in the morning, after I slept on the couch, and the whole way I couldn’t stop staring at her and smiling.

This might sound dumb, but we never ended up telling Arthur or the group that we were dating. At first it was because we didn’t want to make things weird. We were very conscious, especially in the beginning, that it might not last. Some of it was a desire for privacy, or a segregation of social roles, because if we were suddenly dating in all contexts then that would place this huge pressure on us, with questions and probes coming from everyone we knew. And yes, some of it was about Arthur.

“Yeah, I know he likes me,” said Tiff one night, as we lay on her couch together with her DVD player bouncing its image around the corners. “Promise not to be jealous?”

“The mind is a funny thing,” I replied.

“I did like him,” said Tiff. She was watching my face as she spoke. “Especially in the beginning, when we’d get into these big arguments, he was just so passionate about all these stupid little things.” She placed a finger on my collarbone. “You’re like that too, but about different stupid little things, and it’s hard to notice sometimes because your thoughts are like these icebergs, and you only ever reveal the tip.”

“Just the tip,” I said. “Just to see how it feels.”

She gave me a playful slap and then kissed me. “I was saying something. Oh, how is your funny mind?”

“Fine,” I said. “You were saying that you liked him.”

“I did,” said Tiff. “And I knew that he liked me. I kept waiting for him to ask me out or even just
confess to me, but months and months went by and he never did, and then my interest started to fade because there was this other handsome boy, so what was I supposed to do?”

“Make the first move?” I asked.

“Not making the first move is a woman’s privilege I will happily take,” said Tiff. “I get clammy just thinking about it. Feel how clammy I am.” She stuck out her hand, and I clasped it in mine.

“You are not at all clammy,” I replied.

“No, but I like when you touch me;” she said with a faux-shy smile.

“And anyway, this part of it was all fun and games. There was something charming about the cloak and dagger aspect of secret dating, passing coded messages to each other, that kind of thing, and no one was any the wiser, which meant that we didn’t have to tell the group or Arthur and make things awkward or painful for anyone. We carried on like this for about five months.

Then Arthur got in a car accident, and eleven days later he died, and it all went to shit.

We were playing at Reimer’s house, and I’d shown up half an hour early because I had been dragging my feet on preparing for the session. We had started a new, temporary campaign when Arthur got in his accident, because we all felt bad and didn’t want him to miss out on any sessions of the regular one (and if he hadn’t been in a coma, I think we would have tried to play during visiting hours). I’d decided on Long Stairs, vol. 2, because army guys going through an infinite fantasy dungeon sounded like the sort of brainless thing we could use to occupy our time. After he died, I kept running it, because the thought of going back to our old campaign and just dropping his storylines seemed like it would leave me a sobbing mess.

“So, how long have you and Tiff been a thing?” asked Reimer as I looked at my notes.

“A few months,” I said. I didn’t ask him how he’d found out, and I didn’t particularly care. I didn’t even make a token denial. The cloak-and-dagger covert dating thing had, understandably, lost its luster, so we weren’t really bothering.

“Seems like the kind of thing that you should have shared with the class,” said Reimer.

“Fuck off,” I replied.

“Do you wish you’d told Arthur, before he’d died?” asked Reimer.

I picked up my black novelty d20, hard acrylic and the size of my fist, and whipped it at him as hard as I could. He brought a hand up to block it and grunted in pain as it hit his forearm.

“You are such a fucking asshole,” I growled.

“Yeah, I am,” said Reimer, rubbing his forearm. “The difference between the two of us is that I know I’m an asshole, and you prance around like you were his bestest friend in the whole world. You and Tiff could have told him, he’d have been upset but at least it would have spared him being made a fool of. He died a virgin, pining after her, and you were just laughing behind his back about what a moron he was.”

“You know it wasn’t like that,” I said. I could feel the rage building up, and it hadn’t been more than
a week since I’d been arrested for attacking Victor Clark over his whole ‘god has a plan’ thing. But in
the wake of Arthur’s death, nothing seemed like it mattered anymore, and I kept thinking about how
good it would feel to smash Reimer’s face in. “He was my best friend.”

“Maybe when you were growing up,” said Reimer. “After that, Tiff was your best friend, because
you chose her over him.”

Tom showed up a little bit after that, walking into the stony silence and asking if everything was
okay, to which we both replied that it was nothing. What Reimer had said cut deep, because I had
already been thinking those same things, and it wasn’t like you could just call dibs on a girl, they
weren’t property, but at the same time, why hadn’t I told him, if I knew he was still hung up on her?

I killed Reimer’s characters eight times that session, an all-time record by a very wide margin,
sometimes without looking at the dice, and one time without giving him so much as a (meaningless)
roll. After the second death he stopped making new characters and just brought back the old ones
with different names, and I kept killing them in various ways with little regard to the rules, the
narrative, or the increasingly uncomfortable atmosphere of the game room. Reimer just took it
without saying much of anything, except maybe to tip over a mini, and the party trudged on, battling
the endless horrors of the Long Stairs until they found another of his characters, a lost marine or
something equally contrived, who would proceed to die within a few minutes.

“Fun session,” said Reimer at the end of it, without a trace of humor or warmth in his eyes. “Same
time next week?”

When Tiff asked me what that had all been about, I shrugged her question off, because I didn’t want
to have to repeat what he’d said to me.

The funny thing was, while Reimer and I never actually made up, we kept playing together, and in
the end, just before I left Earth, he and Tom were the only ones still willing to play with me. For
Reimer, it was because he was something of a masochist when it came to tabletop, not to mention a
stubborn asshole, and Tom, I guess, because he was a great guy who thought that the final death of
the group before we all went off to college would have been a travesty, or maybe just an insult to
Arthur’s memory.

Looking back, I have to wonder how much of Reimer being a dick to me was just him trying to
process the grief in his own way, in the same way that I started to lash out at pretty much everyone
around me for every little slight, or anything that could possibly be interpreted as disrespect to
Arthur. I was his best friend, and he was mine, that was how I saw myself after his death, and I
applied as much paint to our relationship as possible, until it was sometimes hard to remember that
I’d been anything but a perfect friend.

My relationship with Tiff was one of the early casualties. It was hard to take joy from her kisses
when I felt like I didn’t deserve them. It was hard to comfort her when doing that felt like a betrayal
to Arthur’s memory. He might have wanted me to be happy, but I didn’t want myself to be happy,
and that was probably the death blow for things between Tiff and I. We drifted apart by inches until
she was sitting somewhere else for lunch and the last text message from her (an unanswered ‘how
are you doing?’) was months ago.
In Search of a Quest

I didn’t manage to fall asleep until Fenn snaked a lazy hand under the covers and laid it across my chest. I don’t know if she did that by instinct, accident, elf luck, or because she’d woken up enough to see me staring at the ceiling and thinking, but either way, it was a comfort.

When I woke up in the morning her side of the bed was empty, and my clothes and weapons were laid out for me, with my armor off to one side. The smell of breakfast came in through the open bedroom door, and I dressed in a hurry, electing to leave the armor off. I was feeling much better than I had felt the night before, with a clearer head.

Fenn was cooking pancakes and bacon, and had already made a mess of the kitchen. When I came over to the dining table, which was in the same large room, Amaryllis slid me a cup of coffee in a thick mug, with a small, dark yellow square floating in it that I assumed must be butter. She raised an eyebrow my way, and on the assumption that she was asking if we were still okay, I gave her a nod.

“So, now that we’re all here, we shall eat pancakes and discuss the future,” said Fenn. She set a large plate down on the table, stacked with pancakes, and then another large plate, stacked with bacon. Grak immediately took the top third of the pancake stack and moved it to his plate, then began eating it with his hands. “Enjoy the bounty of the freezer and pantry of Weik Handum, long may it provide.”

“My end goal is to find and rescue the Lost King, wherever he might be,” I said. “I assume that’s going to be difficult, because I have to imagine that a lot of other people with better resources have already tried, but I knew him, so that at least gives me something of an edge.”

“Joon comes out with a strong pitch!” said Fenn. “Can our princess deliver a better counter-offer?”

“The Lost King is most likely dead,” said Amaryllis. “It’s been five hundred years. At best, he’s in one of the hells, at worst, both his soul and body have long since been destroyed. Even if we assume a best case scenario, the original plan we made when I was still sick was that we should endeavor to complete as many of Juniper’s quests as possible in order to make him more powerful. That’s instrumental toward finding and retrieving the Lost King.”

She folded her arms, and I noticed she was wearing a different shirt from the night before, this one with “Boning by the Bay” written on it. I was partially successful in suppressing a giggle.

“Neither of those are plans,” said Grak, wiping the back of his mouth with his hand. “What is the list of quests?”

I closed my eyes and looked at my character sheet, then read them off one by one.

Quests
Straddling Worlds: There are others like you, those with dreams of a place called Earth. The so-called dream-skewered are studied at the Athenaeum of Speculation and Scrutiny. You can travel there to find out more.

God Botherer: There are gods in this world, titans of power and masters of domains, each their own creature with their own special rules. Tread carefully around these creatures, especially if you wish to someday join their ranks.

The Lost King, Found?: Five hundred years ago, Uther Penndraig, figure of legend, King of Anglecynn, and ancestor of Amaryllis, disappeared from this world while on a quest of grave importance. This enduring mystery must have an answer for those brave or foolish enough to seek it, mustn’t it?

Boneitis - The problem goes deeper than the bones, further than the heart, and straight into the very essence of your mortal existence. Find someone to alter your soul, or alter it yourself; either way, this is a project to approach with caution.

Summer’s End - Return to the place where Fenn received her scars and bring justice to the elves. (Companion Quest)

They Say You Can’t Go Home Again - He had a life, before you, and you had a life, before this.

(I left that last one off, because it was creepy and I didn’t want to do it.)

“Okay, well I think we all know which of those I would prefer,” said Fenn as she plucked a piece of bacon off the plate. “It feels good to be the best, most important companion.”

“Amaryllis is more important,” said Grak.

“Grak, did we not bond with one another watching over these two hoomans?” asked Fenn. “Did we not fill several jars with unicorn blood, working in perfect harmony, did we not butcher the beast together, did I not cackle maniacally as I watched you try to chase down the naked jaybird?” She asked this last one with a finger pointed Amaryllis’ way and a grin on her face. “Alright, I can see where the cackling might not have been that endearing, from your perspective.”

“Amaryllis controls investiture of the entads,” said Grak. “She is also the most traveled, giving us the widest range with the key.” He took another bite of pancake, munching it with his wide teeth. “She is also the second-least annoying, after me.”

Fenn narrowed her eyes. “Betrayer.”

“We should do them in order of how easy they are,” I said, “We’ll have to factor in the difficulty we might have in moving. I think at a certain point it’s going to make sense for us to just use the normal systems of travel that everyone else uses, just in the interests of keeping a low profile.”

“Straddling Worlds, then,” said Amaryllis. “But Boneitis is more important in terms of keeping you healthy.”

“It’s really not that bad,” I said, “I think boosting my END curbed it. The worst I felt was during training, and -- I should write out an updated character sheet and a list of discovered rules again, but it looks like I’m going to be capped on what I can do when we’re just sitting around making up training exercises.”

“How are new quests formed?” asked Grak.

“I’m not too clear on that,” I said. “Sometimes I’ll get one when someone tells me something, or
when they ask me to do something, and there are some quests that come in parts, meaning that I get the next one as soon as the first part is done.” I took a breath. “So if anyone has anything they think is a quest, you can try to offer it now and expand our options.”

“I need one thousand pounds of gold for my penance,” said Grak.

“Ugh,” said Fenn. “First of all, we already know that, second, that’s not how you deliver a quest.” She cleared her throat and then started in on her best dwarf impression. “Juniper Smith, I have grievously wronged my clan and must return to them with a sizeable fortune of gold as my penance. I will not be greeted warmly upon my return. Your presence by my side upon my return to Drilly Ird would be the warmest possible closure to this chapter of my life.”

**Quest Accepted: All That Glitters - Return to Darili Irid with Grakhul once da has gathered enough gold to satisfy da nad self-imposed penance to da nad former clan. Speak with Grak to learn more. (500/1000) (Companion Quest)**

“That … actually worked,” I said. “I think maybe the difference is that I was invited? It switched from being something that he was going to do on his own to something we’re going to do together?”

“I did not invite you,” said Grakhul. “This matter is personal.” That much was clear from the quest text, and the words ‘self-imposed’ brought both clarity and questions to what it was he really wanted, beyond gold.

“Well it’s going to take another five hundred pounds of gold,” said Fenn, “And I will fight anyone who wants to use group loot to that end.”

“I have no argument with our arrangement,” said Grak, folding his arms across his chest.

“And you still have no quest to return me to power?” asked Amaryllis. “Do you think it would work if I asked you to be my knight?”

I let out a breath. “I think it might interfere with the Lost King quest, if I’m being honest,” I said. I watched her ice blue eyes, hoping that I could catch any traitor thoughts there. “The entire political structure of Anglecynn for the last five hundred years has been built on the fact that the Princes and Princesses are only ruling in his stead, if he comes back, there’s going to be at best a massive reform.”

The idea of dragging Arthur out of whatever hole he was hiding in and bringing him back from the dead, only to have him continue the rule of Anglecynn, caused some dissonance in me. What was my end-game here, after he was back? I didn’t think there was an Earth for me to return to, and certainly I didn’t want to be slapped back into a simulation of the Kansas I had left. I didn’t imagine that Arthur would want that either, but after a lifetime on Aerb, maybe he would have disagreed. I wasn’t entirely convinced that the game wouldn’t end then; it seemed to me like that was the ultimate quest.

“I will accede that’s a possibility,” said Amaryllis. She folded her arms across her chest, mirroring Grak, though her expression was more mild than his permanent resting frown.

“They don’t have to be personal quests, right?” asked Fenn. “They can be anything?”

“Based on the evidence, they just need to be something that I can accomplish.” I rubbed my neck. “So far as I can tell, they don’t even need to be particularly reasonable for a person to do.”

“And if you’re right about the nature of this world, then you’re directly responsible for everything
from the undead to the unicorns, right?” asked Fenn. “So some would say that you have a moral obligation to clean up all the messes you made.” I didn’t like where she was going with this, and my imaginings were just that, fictions made real (or at least more real) by the Dungeon Master of Aerb.

“You’re saying that I should fix everything in the world?” I asked.

“No, nothing like that,” said Fenn. She pointed a finger at Amaryllis without looking at her.

“Encyclopedia girl, tell me how many --”

“I will suffer through being called Mary, and I will suffer through what I don’t doubt are an endless series of horrible clothes you picked up for me, but I am a princess of Anglecynn and the most direct descendant of Uther Penndraig and I will NOT respond to ‘encyclopedia girl’,” said Amaryllis.

“That’s where you draw the line?” asked Fenn with surprise. “Someone is in a bad mood this morning. Very well, Princess Amaryllis Penndraig of the Kingdom of Anglecynn, tenth of her name, Slayer of Gold Mages, Drinker of Unicorns, The Immobile Woman, I humbly ask you to tell me how many major or minor exclusion zones might be ended by a rag-tag group of heroes.”

“None,” said Amaryllis.

“Bullshit,” said Fenn.

“If these things could be done by a single person, or even a small group, they would have been,” said Amaryllis. “Do you think the international community is so negligent that they would let Fel Seed sit on his throne in the City of a Thousand Brides if there were any option to do otherwise? It’s flatly impossible to kill him, by any means, not even in theory.”

**Quest Accepted: Gone to Seed - There is a place on Aerb considered worse than the first four thousand hells. Fel Seed sits on a throne of living flesh, unable to spread beyond his domain, but with a rule of horror within it. You know his weakness.**

“Fuck,” I said.

“Were you deliberately tempting fate?” asked Fenn.

Amaryllis shrugged, and I saw a slight smile that disappeared almost at once. “It can be done then?”

“The game seems to think so,” I said. “It also thinks I know his weakness, which, uh, might be a problem, because I really don’t. Let’s not do that one.”

“Well I’m not suicidal,” said Fenn, “Unlike the three of you, I have a vested interest in living. If we can give Juniper’s brain a hundred quests, we don’t have to actually do anything with them, but sometimes the game drops hints that might be useful.”

I agreed with her logic, but I really didn’t want to have the Fel Seed quest sitting there in my head to look at, because if the game put that quest there, then it meant that there was at least a chance it wasn’t impossible, and even if I wasn’t responsible for him, I did have a moral obligation to end him if I was the only one that could do it. He probably wasn’t real, the simulated people he was torturing probably didn’t have actual computing power dedicated to them, they didn’t have real lives … and yet, you could do conditional probability, the odds that those people were real multiplied by their pain and suffering, and surely the numbers would dictate that I should at least give it consideration.

“Thirteen,” said Amaryllis. “You won’t be able to do anything about the ones like Blue Fields or the Datura Desert, but there are thirteen enpersoned exclusion zones which you might be able to defeat, if you rise to the heights that Uther Penndraig obtained.”
“Okay,” I said. “Well I’ve got a meta-quest for that, but I’m actually not suicidal,” anymore, “thank you, and I was thinking that we could do something that’s easy for once in our lives. Are there people we can meet, places we can go, things we can do that don’t necessarily involve combat, or at least where combat is with people who aren’t trying to kill me.”

“I believe there are two ancestral caches left which Aumann would not have been able to break past, even if he knew about them,” said Amaryllis. “One is within an exclusion zone, the other one might as well be. The castle in Glassy Fields is both warded and encased in razor-sharp shards of glass, with the vidrics sure to attack us on approach. It dates to just after Uther Penndraig’s disappearance, which should make it of special interest to you. It was never considered worth the probable costs to retrieve whatever might be there. There’s a reason that no one loots the Glassy Fields.”

**Quest Accepted: The Slayer of Horrors (0/13)**

“Okay,” I said. “Well I’ve got a meta-quest for that, but I’m actually not suicidal,” anymore, “thank you, and I was thinking that we could do something that’s easy for once in our lives. Are there people we can meet, places we can go, things we can do that don’t necessarily involve combat, or at least where combat is with people who aren’t trying to kill me.”

“I believe there are two ancestral caches left which Aumann would not have been able to break past, even if he knew about them,” said Amaryllis. “One is within an exclusion zone, the other one might as well be. The castle in Glassy Fields is both warded and encased in razor-sharp shards of glass, with the vidrics sure to attack us on approach. It dates to just after Uther Penndraig’s disappearance, which should make it of special interest to you. It was never considered worth the probable costs to retrieve whatever might be there. There’s a reason that no one loots the Glassy Fields.”

**Quest Accepted: Through the Lashing Glass - Far inside the Glassy Fields exclusion zone, the only place on Aerb where glass magic still works, lies a castle coated in shards. The treasures within are unknown to the world, but you could unearth them, if you dared.**

I gave her a thumbs up at that, and she nodded.

“The other is three miles down the Boundless Pit, abandoned since the tuung claimed it, but warded against them,” said Amaryllis. “I believe it should contain a suit of armor with a short-range investiture, assuming that the wards around it haven’t been broken past and that the tuung haven’t made an effort to detach it from the pit walls, which they might have. The place was built by an architect under forge frenzy, and contains its own defenses that make it a formidable conquest; since Weik Handum isn’t secure, and cannot be made so, I would suggest that Kuum Doona be made our new base of operations, if we can get to it, though only a fool would chose to defy the tuung lightly.”

**Quest Accepted: A Room of One’s Own - The Boundless Pit is a mile wide and infinitely deep, a chasm from which little returns. The tuung call it their home, and imperial law agrees, but infinity is a large place, and a secure home stays stuck to the wall, waiting to light up with activity once more. Kuum Doona awaits.**

“Okay, got that one too, but I’m not sure that we really need to end every single quest suggestion with a dire warning about how foolhardy or deadly it would be,” I said.

“Though woe betide any who might attempt it, we could look into getting me some kind of awesome magical hat,” said Fenn as she grinned at me.

“Oh, I think it’s not a bad idea,” I said. “I don’t actually think any of that expanded our options, not unless anyone wants to go into yet another exclusion zone.”

“The Boundless Pit isn’t an exclusion zone,” said Amaryllis with a slight frown. “The term has a very specific meaning, even if you disagree with the imperial designations.”

“Okay,” I said. “And given that we can’t stay here without having to constantly worry about whether someone is going to show up and find us, I think that’s probably a reasonable near-term goal. I must be close to leveling though, and in my ideal world, I would do that without combat on the line, especially given that I still need my bones healed. To me, that means our next step is either finding someone who can do soul magic, or going on either the Straddling Worlds quest or the God Botherer quest. Because God Botherer doesn’t seem like it’s going to end at simply meeting a god, that means that we’re down to either going to the Athenaeum of Speculation and Scrutiny, or we’re going to try to find someone who can take a peep at my soul.”
“Unless Mary has a supremely trusted soul mage on call, I vote for the athenaeum,” said Fenn.

“Me too,” said Grak. “I would not trust a skilled soul manipulator.”

“Noted,” I said.

“We still have to worry about Larkspur,” said Amaryllis. “I don’t believe that he would dip into the kingdom’s supply of elf luck again, but that’s a possibility that we need to be prepared for. More to the point, he has power both within Anglecynn and the Empire of Common Cause which he could use to make our lives difficult, even if we aren’t moving against him. From there, he would likely try to kill me, or capture the rest of you in an effort to kill me. So long as Anglecynn’s FSD is after us, we’ll have to keep moving around like rats, afraid of the light. It’s ammunition to use against him, if,” she hesitated, “If I ever have a future in Anglecynn.”

“You’re saying we kill him,” said Fenn. “Figure out a way to lure him somewhere, then slice his stupid head off.”

**Quest Accepted: Slice His Stupid Head Off** - You still have to worry about the Foreign Security Director of Anglecynn, Larkspur Prentiss. He’ll have you running like rats, afraid of the light, so long as he lives. Figure out a way to lure him somewhere, then do as the quest title says.

I stared at that message, then blinked it away.

“Something happen?” asked Fenn.

“No,” I said. *Just the quest text quoting the two of you. Are these being written on the fly or are the talking points being inserted into the conversation by the Dungeon Master? Really hoping that it’s the former.* “I got a quest to kill him.”

“The detection wards I placed just pinged,” said Grak, who sat up from his chair. “They’re a half mile out, we should leave before anyone arrives.”

I frowned at that, but moved into action. We had a plan for this, and I wasn’t about to deviate from it. I ran up the stairs to my room while the others went to theirs, snatched up my armor and my messenger bag, which had all my worldly possessions that weren’t in the glove, and then ran back down into the basement, to the one room in Weik Handum where teleportation wasn’t blocked. Grak had put up his own wards there, to ensure that no one could come in through that back door, and when I arrived he was moving his wand, bringing the ward down.

“Wish we could see who it was,” said Fenn as she came into the room, with Amaryllis close behind her. “But not so much that I’m willing to risk getting a bullet in the brain.”

“Where are we going?” asked Amaryllis, who shut and barred the door behind her. She looked incongruous in her t-shirt and shorts, a serious expression on her beautiful face and an excited energy that I knew was only a few moments away from turning deadly if she needed it to.

“Speculation and Scrutiny is the consensus,” I said. “If we’re rats, then I can live with that in the short-term.”

“I’ve never been there,” said Amaryllis as she held out the key. “We can’t use the touchstone.” She closed her eyes, and I could see rapid movement beneath her eyelids. “I can put us a hundred miles away, on some train tracks, it should be in the middle of nowhere with, at most, some farmers around. There, or back to my room in Cranberry Bay?” (The room was paid through for the rest of the week, with strict instructions not to disturb, just for this sort of eventuality, but there was a chance
that a sufficiently widely cast net could have tracked us there and set up an ambush, or at least given an alert.)

“Train tracks are fine by me,” said Fenn. “I’ll prepare my expert-level train-dodging skills.”

“Do it,” I said.

And a few seconds later, with a brief moment of blinding pain, we were standing on train tracks that sat on a raised embankment between two large, ordered rows of flowers. There was no rushing train to greet us; instead there was a short woman with a cloak of leaves and a long staff, her skin green and hair a light brown, the race crantek if memory served. She was in the flower fields, staring at us with no surprise on her face.

Fenn’s bow was in her gloved hand in an instant and she had an arrow out a fraction of a second after moving the bow from one hand to the other, all in a series of smooth motions. I placed my hand in front of the arrow as soon as I saw what was happening.

“I’m pretty sure that’s our next companion,” I said.

The short green woman gave us a small smile and a friendly wave.
The one thing we hadn’t gotten around to discussing was the issue of companions. Uther had seven of his Knights of the Square Table, and extrapolating from that, I was bound to have at least a few more. Both Amaryllis and Fenn I had stumbled across, while Grak had been someone we’d met after setting out some bait. I had an inkling that it might be worth it to find as many companions as possible, but then realized that logistics weren’t on our side, given the teleportation key only took five people at a time.

(We hadn’t tested Fenn’s glove-past-the-limit theory yet, because it seemed too risky to me. Things that were in the glove stayed in the glove across teleportations, but I had this nightmare scenario of putting someone in the glove and trying to exceed the limit, only for the game to punish us by disconnecting the extradimensional bubble. Would the game kill a companion for that? I wasn’t sure, but I wasn’t willing to test it, and there were lesser fates we might suffer, like having to go on a long quest to retrieve them from wherever rogue extradimensional bubbles spit out their contents.)

I could at least make some guesses about what a new companion would look like, and what their role would be, given what I had seen so far and what I assumed about either the shape of the game, or how the Dungeon Master thought. Companion #4 would be different from companions #1-3, with as little repetition as possible, which meant that he or she (probably he, given that we were gender-imbalanced (depending on how you counted Grak)) wouldn’t be a dwarf, wouldn’t be a half-elf, and probably wouldn’t be a full elf or a human, though I was less sure on those two. Humans were the majority race here, and a full elf might provide some (totally unwanted) tension with Fenn, but in terms of traditional D&D party makeup, it would be better to go with something else.

Companion #4 probably wouldn’t be a warder, because Grak had that covered, and probably wouldn’t be an archer, because that was Fenn’s job. Amaryllis’ role in the group, seen through the classical D&D party lens, was as the face, the person who did all the talking and politicking, but I didn’t think she really fit in with that role. Instead, she had mostly been the plot-driver, information-giver, and source of wealth, but those weren’t actual party roles. Regardless, my guess was that Companion #4 would have some magic that I didn’t currently (and possibly couldn’t ever) possess.

Lastly, there was the question of magic items. Amaryllis had nothing but the void tunneler when I met her, Fenn had her artillery bow, and Grak had both his warder’s implements and a magical axe. There was something of a trendline there, and it conformed to roughly how actual D&D parties worked; you couldn’t just have new characters come in underequipped, otherwise they would be too weak and demand too much of the new loot, so they had to have something worthwhile on them to keep them in line with the party. If they’re in line with the rest of the party despite having nothing, then they get too powerful once they start getting equipment, which is a different problem.

So when we stumbled into a mysterious green-skinned crantek woman with a fancy cloak who seemed to be expecting us, my companion sense immediately began tingling.

Fenn kept her arrow nocked, but eased up on the draw.

“Hi friend!” she called to the green woman.

“Greetings,” replied the green woman with a small bow. Like Fenn, she was projecting her voice to be heard across the field of flowers. “You might want to step off those train tracks. I don’t think a train is coming, but it makes me nervous.”
The flower fields she stood in were being farmed, for what reason I could only guess at, though my mind immediately leapt to the Dutch tulip futures craze of the 1600s (more likely they were for dyes). Beyond them was forest, and beyond that were tall, dark purple mountains shot through with layers of white strata. There was no one else around, and whoever tended to these flower fields, they didn’t have so much as a shed in the area. It was a strangely idyllic place for a meeting.

Amaryllis stepped down the embankment, putting us closer to the woman, and I followed after, with Fenn close behind me. “Did your eyes say companion, or was that a guess on your part?” Amaryllis asked, slightly under her breath.

“She shows purple, the same as the three of you,” said Grak. It took me a moment to realize that he was talking about his magic glasses, which he’d taken out from his furs and put on. “I think purple means friend. The people of Cranberry Bay ranged between blue and yellow.” He took off the glasses and raised his monocle to the green woman, who was waiting patiently with a slight smile on her lips. “Staff is magic, cloak is magic, woman is magic,” he said.

“Really?” asked Fenn. “The cloak is magic? Thank the gods we have you around.” This was sarcasm on her part; the cloak was made of a variety of different leaves, which were green at the top and shifted in color until it reached her calves, where it was red. There were no obvious threads, seams, or other indications as to what might be holding it together. All in all, it was probably the most obviously magical item I’d seen in Aerb thus far.

“Dial it back a bit,” I said. I tried to keep my voice low. “Grak, thank you for checking.”

“Sorry,” said Fenn. She turned to Grak. “That thing you said about me being annoying really got to me, you know?” She raised her voice and called to the green woman, “Hey lady, are you particularly annoying?”

“No really,” the woman called back.

“Drat,” muttered Fenn.

“Juniper?” asked Amaryllis. “Is she confirmed as a companion?”

“No,” I replied. “I agree it’s suspicious. She was waiting for us, clearly. Even if she is a companion, part of our kharass, there needs to be a plausible reason for her to be here. More dipping into elf luck?” The woman was still waiting patiently for us, resting some of her weight on the staff, which had a bird’s skull at the top, embedded in the knurled wood.

“I don’t know,” replied Amaryllis. She was still standing there in her t-shirt and shorts, and when she cast an eye toward Fenn I imagined she was wishing she had armor on. “Maybe we should stop being rude and go introduce ourselves.”

The crantek had been a race that I over-designed and then only used for a single story arc, and I was pretty sure that my 7 KNO was the only reason that I was able to recall anything much about them, because I hadn’t been studious in reading through The Book of Blood. They were short and green-skinned, with their natural habitat being the boundary zone between forests and fields. Their skin allowed for photosynthesis, but it wasn’t enough to keep them up and running, so they were ruminants as well, eating hard-to-digest plants or grass and then chewing their cud.

The go-to mode of behavior for crantek was to go into the forests, gather a bunch of green things to eat, and then find a sunny place to sit and chew cud. I had all these plans for what crantek society was like, how they handled their winters, what they did on rainy days when the sun didn’t shine, their beliefs about their place within the food cycle, and none of it ever really came up. The most that
I ever got to show them off was with a crantek elder who had a habit of regurgitating and chewing on cud when he was thinking.

The green of this crantek’s skin was a light, pleasant color, and she was cute, with slightly childish features, like I always thought of hobbits being. This bothered me a bit, because the crantek weren’t supposed to be attractive to humans, at least not as I’d drawn them up. Why would they be? Different species (races, in D&D parlance) shouldn’t actually be attractive to each other, not unless they could cross-breed, and that had been something that I’d had a bug up my butt about when I was drawing up the crantek.

This woman didn’t conform to my fifteen-year-old self’s designs in a few ways. She had ears, not concave pits on the side of her head, and her teeth were more-or-less human, at least from what I had seen when she was talking, which made no sense for a ruminant animal. (And yes, I could already think of all the excuses and justifications that I, and presumably The Book of Blood, would use in order to have cute-to-humans crantek, but it still bothered me, because that wasn’t how I had made them.)

“Oorang Solace,” she said with a bow, once we were close enough that we didn’t have to raise our voices. “You may call me Solace.”

“You saw us come in,” said Amaryllis. She had hidden the teleportation key away the moment we’d landed, and wasn’t holding it anymore. “You were waiting for us.”

“Yes,” nodded Solace. “I’ve spent the last year looking for the four of you.”

I glanced at the others. So far as I knew, this time last year I hadn’t yet existed, and my body had been in some kind of institution or prison. Fenn was also in prison, or possibly not yet arrested for looting an exclusion zone, and Amaryllis was still busy being a princess, and Grak was … doing something, but not something all that important in the scheme of things.

“And who do you think we are?” I asked.

“Ah,” said Solace with a smile. “That, I do not know. The spell I cast was not to find you specifically, but someone who was both willing and someday capable of helping me to save my druidic grove.”

“You’re a druid?” I asked. I hadn’t thought that Aerb had druids.

“You’re not a druid,” said Amaryllis. “The last of the loci were exterminated during the Second Empire. They couldn’t move, which meant they couldn’t hide, and they didn’t have the firepower to fight back. There haven’t been any druids for three hundred years.”

I saw Solace glance down at Amaryllis’ shirt (‘Boning by the Bay’) and frown. “I understand that’s what’s taught at the athenaeums these days. Would you care to see some proof?”

From her cloak she pulled out a large, five-gallon bottle with thick glass walls, which she set on the ground in front of her. It didn’t escape my notice that there was no possible way that she could have hidden the bottle in that cloak, which at least gave a hint to what its magic was. The bottle itself was magic as well, that much was clear from looking at it, because inside was a miniature forest with a clearing in the center, which sat on top of a half-foot of dirt. I might have thought that it was a diorama, if not for the details.

Amaryllis stared down at the bottle, and Grak pulled out his monocle to look at it. There was an entire scene in there, laid out before our eyes, an entire ecosystem in miniature, captured.
“Nice bottle,” said Fenn.

“Are you carrying around a locus?” asked Amaryllis with wide eyes. “Is that even possible? Has it been surviving within that bottle for the last three hundred years?”

I held up a hand. “Clearly, you actually are a druid,” I said. “What spell was it that brought you to this specific place and time, placing you at just the right point to see us arrive when we didn’t even know we were going to be here until minutes ago?” That seemed like the most important point to me, because I wanted to first make sure that Larkspur couldn’t use the same method to find us, and second I wanted to see whether we could find Arthur with it.

“It was a spell of Zorisad Yosivun, the Deep Searching,” said Solace with a small bow at the foreign words. “It takes a year to cast, and at the end, that which was sought is found. If it cannot be found, the spell will cost the caster her life. I sought those who would be willing and someday capable of helping me. As the spell is concluded, and I am not dead, and the four of you are the only ones around for miles, I can only presume that you will be the ones to help me.”

I frowned at that. “How does the spell judge willing and ‘someday’ capable?” I asked. “How does it … how is it supposed to know?” What’s stopping us from fucking off to go do something else? I knew the D&D answer, which is that things could always go off the rails at any moment, and the DM was just making as good a guess as possible about what the future would hold, but I really hoped that her answer would be illuminating.

“Zorisad Yosivun works differently depending on what you ask for,” said Solace, again with a small bow as she said the spell’s name. “For people, it searches within hearts and minds and takes its measure of you. It brought me inexorably to this time and place.”

“That was a very non-technical answer,” I said.

“The druids were non-technical,” said Amaryllis. She had been crouched down next to the bottle and now stood up to look Solace over. “They were powerful when near their locus, one of the most powerful of the mages of the Lost King’s day, but even before the Second Empire began its campaign against them, they were beginning to lag behind the other schools of magic.”

Solace nodded. “The revolutions of the First Empire were not compatible with druidic modes of practice.” She reached toward one of the rows of flowers with a slender hand and with a come-hither gesture, one of the blue flowers began to grow, extending its stalk in defiance of the principles of both botany and physics, until it rested just under her nose. She gave it a sniff and murmured in satisfaction, then gestured at the flower again, which sent it back to where it had been. “The Deep Search was only for those willing and possibly capable, it gave no promises about the future. There are things I can offer you, both my aid as a druid and as a flower mage of some small power, as well as the magics the grove has steadily accumulated over the centuries.”

“Alright,” I said, “We’ll do it.”

“Juniper,” Amaryllis said with a tight voice. “You cannot unilaterally decide these things.”

“We’re a democracy, dammit!” said Fenn. “But I vote yes, and you gave Joon the tiebreaker, so consider that another win for democracy.”

Amaryllis sighed.

“You’ll have to tell us what, specifically, you think we can do,” I said to Solace as I watched Grak tapping at the bottle with his monocle up to his eye. “Or I guess if you just used magic to find us,
then you need to tell us what your problem is, in detail, so we can figure out what tools we have to solve it, or might acquire in the future."

“We placed the locus in this bottle three hundred years ago,” said Solace. “The environment inside is self-regulating, and the natural home of the locus, though limited in land area by what the bottle can hold. I am the last of the druids tending to it, and without me, I believe that the land inside will die, and the final locus with it. What the Deep Searching has indicated is that you are willing and might someday be capable of finding a permanent solution to the problem.”

**Quest Accepted: Taking Root - The world has but a single druid, tending to but a single locus. With the locus so constrained within a magic bottle, no more druids may be inducted, but removal might prove fatal. With your help, druids might stalk the world once more. (Companion Quest)**

“There are significant wards inside this bottle,” said Grak. He reached for the top of the bottle, and pressed a thick finger against the neck. Solace made no move to stop him. The bottle tipped up on edge, but the earth and trees inside it stayed in place, not sliding or moving even as Grak pushed the bottle up to a fifteen degree angle. He let it back down, slowly and gently. “Wards are static,” he said. “The wards are anchored to the internal extradimensional space, not to reality.”

“Is that a problem?” I asked.

“No,” said Grak. “It indicates a vastly powerful collective of linked warders.”

“This isn’t the first time Zorisad Yosivun has been used by this druidic grove,” said Solace with a small bow at the words.

“You understand that this isn’t a thing that we can do right this moment?” I asked. Solace nodded. “I don’t mean for lack of will, but because we don’t have the first clue how such a thing could actually be done.” The fact that I now had a quest indicated that it was probably possible, and the fact that it was a companion quest meant that she was a companion, which implied a certain level of trust (though I hadn’t forgotten that Grak’s loyalty had started in the negatives).

“I didn’t ask for those who were willing and capable at the moment,” said Solace with a light shrug.

“Is there a reason for that?” I asked.

“As I said, this isn’t the first time that Zorisad Yosivun has been used by this druidic grove,” said Solce. Her voice was gentle, but I could read the subtext. If the spell couldn’t find what it was looking for, it would cost the caster her life. How many times had this druidic circle cast the spell, with more and more pessimistic wordings, until it had come to this? I couldn’t tell whether that reading was correct or not, but for all her calm I didn’t think that Solace would be standing before us if she had many better options.

“Would you like to meet it?” she asked us, gesturing toward the bottle.

“The locus? In there?” asked Amaryllis, casting her eyes toward the bottle, where the tiny trees were moving gently under the force of a breeze that must have been entirely internal. Her eyes were bright and full of curiosity. “Yes.”

“Seems like a trap,” said Fenn. She still had her bow out and arrow at the ready.

“Helping her is a companion quest,” I said. I watched Solace’s face as I said that. I wasn’t sure how she would take the whole ‘you’re eternally linked to me’ thing, and wanted to hold off on having that particular conversation. She also seemed to have no idea who we were, and if she had been prepared
for our arrival, it wouldn’t have been too hard for her to kill us outright.

“Still seems like a trap,” said Fenn. “Grak and I will stay outside. Grak, start putting up as many wards as you can.”

“I will put up the ones most likely to prevent an ambush,” he said with a frown.

Solace stood in front of the bottle and placed her finger just inside the rim. Her body twisted and warped as it was sucked into the bottle in a flash, distilled down to a tiny thing that was pretty much impossible to see.

“Okay,” said Amaryllis. Any sense of wonder that might have been present on her face had vanished, and she strode forward to the bottle. “We should be able to talk freely for a moment. I agree with Fenn that it seems like a trap, but we very much appear to have made the acquaintance of a practitioner of a magic long thought dead, which would be an incredible boon, and that makes me immediately suspicious.” She looked me in the eyes, hers glacial blue and probing. “You said that she was a companion?”

I closed my eyes and started talking even as I waited for the screens to come up. “I was given a quest for the restoration of the grove,” I said. “It was labeled a companion quest, but looking at the companion screen --” I stopped for a moment, because the companion screen was not as I had left it.

Amaryllis was still at a 9 for Loyalty, Grak had moved up to a 3, and Fenn was at 16. The first point of order was that loyalty could, in fact, exceed 10. The second was that Fenn had somehow gained a whopping six points since the last time I checked. The messages the game gave me weren’t recorded anywhere, and didn’t stick around for long even if I didn’t blink them away, which meant that it was possible I’d gained those points while asleep and never noticed it … or something had happened when I was high on unicorn blood.

“-- it doesn’t show her as a companion, not yet, which means that I can’t see what her loyalty is, and we know that those can start in the negatives.” I hoped that my pause didn’t entirely give me away. Fenn and I clearly needed to have a pointed conversation, ideally in private.

Grak sniffed at that, sucking air into his wide nostrils. “I assume that was me,” he said. “Fenn planned to betray me. It would have been foolish not to plot against you.”

“Water over the bridge,” said Fenn with a wave of her hand.

“I think it’s a risk worth taking,” said Amaryllis. “The Second Empire moved against the druids. The Empire of Common Cause might be able to work with them. There are minor exclusion zones that a locus would be able to revive almost entirely. If we can get them reproducing …” She trailed off and looked at me. “You think that this is a result of your power?”

“Um,” I said. I thought that this was Dungeon Master shenanigans to introduce a new player at the start of a new session, but that would be related to my place in the context of this world as a simulation, rather than any displayed or provable powers on my part. “It’s hard to say.” It’s hard to say whether there were potential companions floating around in the world who we had a high chance of bumping into, or whether there were a small, set pool that showed up on schedule, or whether something even weirder was going on.

“Very well,” said Amaryllis. “We’ll go in, the others will keep guard.” She walked forward and without another word, placed her finger into the bottle. The same magic happened again, twisting and twirling her physical form around for a brief second before she was sucked inside.
“Okay,” said Fenn, “We should be able to talk freely now.” She looked to me with a too-serious expression that was a mimic of the one Amaryllis had worn. She broke after a second of that. “Well I personally didn’t have anything, but if one of you two did?” She glanced at Grak. “Remember, vow of silence, don’t mention unicorn blood.”

Grak rolled his eyes, but said nothing.

I stepped forward to the bottle, psyched myself up, and put my finger just inside the rim. There was no physical sensation of my body being distorted to fit through (and shrunk down?) as I entered the bottle, it was the world around me that seemed to be changing, save for the bottle itself, whose mouth was only growing wider. And then I was falling, with walls of glass on either side of me, until they opened up where the neck of the bottle ended. Below me was the woodland I had seen from outside, spread out right up to the glass, with a small creek running from one end to the other, and a clearing that I was dropping down toward.

I hadn’t actually given much thought to the prospect of what I was going to do to arrest my fall. My assumption was that either the magic bottle had some special feature that would allow me to land safely, that Solace would save me, that the locus would save me, that there were wards that would prevent injury, or maybe that I’d simply heal back from the injuries that the equivalent to a mile-long fall would give me. But it wasn’t until after I had fallen a few hundred feet that the raw terror of the rushing wind set in and I started trying to figure out how I was going to deal with this in the worst case scenario. I had left my messenger bag, with Ropey inside it, on the ground back near the flower fields. I had more bones that I could suck dry for END to heal me, assuming that I could stay conscious when I hit the ground, and I could probably take the Anyblade off my finger and shape it into something that would provide drag to slow me, and that would --

I sprouted wings. They ripped through my t-shirt, making me thankful that Fenn had taken my armor, and I was startled to realize that I could control them with a thought. They were huge, with each one stretching out at least nine feet, and even then I could tell that they would only be enough for me to soar, not actually fly with. With an excited thought I reached out to wings, trying to feel the bones in them like I could within my own flesh and blood, but I was disappointed to find nothing there. More than that, my blood wasn’t pumping through these wings either, whatever magic had made them.

Still, I could glide, and the pure silence of it, with no sound but the rushing of wind, called back a memory of biking in the nighttime. Gliding on these enormous wings put piloting a helicopter to shame, in part because it was so effortless to use them. I didn’t need to think about any aspect of flight, it was as intuitive as if I’d had those wings since the day I was born. That probably meant some level of mental hackery, but I wasn’t about to let that ruin my fun.

When I spotted a flash of long, red hair, I angled down. Amaryllis was looking up at me, and as I circled her, losing altitude with every rotation, I could see that her t-shirt had holes ripped in the back as well. Solace was nowhere to be seen, but beside the creek that ran through the field there was a singular tree, standing tall and alone. A small plume of smoke was rising up from a dead branch that extended slightly past the tree’s canopy.

I landed next to Amaryllis by bringing myself to a dead stop and then dropping the final twenty feet, killing my momentum with a final flourish of the wings. I could feel a strain on my ribs that hurt far more than I had expected it to, but when I came back up from my landing I had managed not to actually break any of my weakened bones. The wings were retracting into my back in a hurry.

“Okay, now that we’re alone together, we can finally speak freely,” I said.

“No,” said Amaryllis. “Assume that the winds here will carry your every word to her ears.”
“Sorry, that was a joke,” I said. One that probably didn’t work without the context of Fenn’s joke, when I thought about it.

“Ah,” said Amaryllis. “Okay, I get it.” She didn’t laugh or smile. “Was there anything you needed to say, that you didn’t say last night? Something you couldn’t mention in front of Penn or Grak?”

“No,” I replied. “Or … there was one thing. You took an amulet with a glowing blue gem from the Caer Laga vault. Fenn and I never did discover what it did, and it was keyed to you personally, so, I’m not saying that I think it was something that you were hiding from us,” though it totally was “but it was one of the things that I kept meaning to ask you about once you got better.”

“It’s a copy of my great-grandfather,” said Amaryllis. “Wearing it allows the facsimile to converse with me. I’m fairly certain that I could push my own essence into it, which would clear him out and make the copy one in my own image, but I’m understandably reticent to do that.”

“Huh,” I said. “That seems like it could have been useful to know about. Really useful. Four heads are better than three.”

“He’s currently useless,” said Amaryllis. “I’ll spend more time with him later, but he wants me to engage in testing with him to ensure that I’m the sort of person who needs his help.” She looked toward the tall tree that had smoke puffing out of its makeshift branch-chimney. From the ground, I could see that there were a number of natural holes and hollows, and the interior of it was lit. “I’m trying my best to be forthright with you, but we have other concerns at the moment.”

“Right,” I said. “I mean at first I was just trying to make a joke, but, you’re right. Let’s go.”

As we walked toward the tree/house, I contemplated the bottle. Gravity still felt the same, which it probably shouldn’t have, and the light outside the bottle still seemed as bright as it had when we were out there. My eyes were smaller now, so less light should be hitting them, right? The obvious answer was that magic was compensating for that, but the how seemed like it might be important, if only because it might reveal some of the underlying mechanisms of the simulation I was pretty sure I was in.

(From the outside the bottle was eleven inches across, and from the inside I could simply look at the walls, get a very close approximation from Range Finder, and then use some simple trigonometry to correct for the fact that I was looking up at the walls, since trees were in the way at ground level. My quick calculations, which I definitely wouldn’t have been able to do without WolframAlpha before reaching 7 CUN, suggested the interior of the bottle had a diameter of ~1.2 miles, meaning that we were at something like 1:7000 scale. The trees were not tiny at all; they were behemoths.)

Solace was waiting for us by a wide hole in the tree, not something carved, but what seemed to be entirely (impossibly) natural given the grain of the wood. The windows of the tree-home were similar, and if you had never met a person nor seen a home, you might have thought that it was just the tree’s quirks that had made it into this.

“You’re actually a druid,” said Amaryllis. “This land, this square mile of territory, is really inhabited by a locus, which you carry around in your magical cloak. You can travel without your power diminishing, because you’re never more than a single press of a finger from your locus.”

“Yes,” said Solace with a faint smile. “Do you love it for the sake of the power I wield, or for the majesty of a forgotten magic?”

Amaryllis hesitated. “Both,” she said. “Druids are, or have become,” she stopped. “You know. You can travel freely, you must know what the word ‘druid’ means to the people of Aerb.”
“A thing lost,” said Solace with a nod. “A symbol of the death and desecration of the Second Empire, a memento of all that has ever been lost and cannot be recovered. Yes, I know.”

“Then why,” began Amaryllis, before stopping again. “The Empire of Common Cause would welcome a locus, especially a moveable one, with open arms. Almost any nation within the empire would throw money and personnel toward rehabilitating this grove.”

“To come under the control of another is not the way of the druids,” said Solace. “I have one master, and that is my locus.”

“And you would see it die rather than administered by a kingdom?” asked Amaryllis.

“You misunderstand the nature of a locus,” said Solace. “To be administered by a kingdom might be enough to kill it, even if the land it had was large, healthy, and mostly untouched by the mortal species. My locus has been confined to this bottle with a single square mile for near-on three hundred years.”

“And besides that, it’s the kind of thing you would use the Deep Searching for anyway,” I said.

Solace looked at me for a moment, then nodded. “This locus has too little land to induct new druids into the grove,” she said. “It took three deaths to Zorisad Yosivun before we stopped trying to find a kingdom to be our salvation.” And each of those deaths with a year invested in the question. Each one gave you information, if only in the negative, suggesting that what you’d asked for was, despite what you might assume, impossible.

It was bothering me that there was still no message about her being a companion. How it had worked in the past was that a loyalty message would pop up after enough time, and after the second level of loyalty, I would be able to see a biography. None of that was exactly pinned down, and there were more complicated theories, but I really thought that I should have gotten one by now.

“So where is the locus?” I asked.

“Behind you,” replied Solace with a smile.

When I turned around, I saw a doe, six feet tall at the shoulder, with skin so pale brown that it was nearly white, and six eyes that were all staring right at me. It moved closer, twitching an ear, then bent its head low to the ground to eat from the grass there, not taking its eyes off me.

*Loyalty Increased: Six-Eyed Doe lvl 0!*
Keep Magic Weird

I stared at the six-eyed doe as Amaryllis approached it. It was massive, for a deer, though showed no signs of giving a crap about the square-cube law. I mean, I also didn’t give a crap about the square-cube law, but it was one of those things that you needed to think about when designing creatures, because someone like Craig or Reimer would start questioning how a fly as large as a house was able to generate lift, and “it’s magic” only worked as an explanation a limited number of times before people started thinking that you didn’t know what you were talking about.

I stayed back. I wasn’t actually clear on why Amaryllis was going toward the thing. There were definitely cultural assumptions and pieces of history that I was almost completely ignorant on, given that “magics that were previously considered dead” weren’t high up on my reading/research list (though when I phrased it like that, it seemed like the most obvious thing in the world was to go after specifically those kinds of magic, because that was plot-bait incarnate). I couldn’t tell whether Amaryllis’ obvious affection and wonder for the locus was being faked for some reason, or stemmed from the place of the druids in the cultural canon of Aerb. Had she been faking those emotions outside the bottle, then dropped them as soon as Solace was gone, or had she been actually feeling those emotions, then suppressed them when it was inconvenient to be having them? I had been traveling with Amaryllis for quite some time, and didn’t actually understand her very well.

I wouldn’t say that I hated deer, but a lot of my time with deer had been spent looking at them down the barrel of a rifle, and I considered venison to basically be the only reason that it was worth suffering their existence. Hunting aside, almost all my interactions with deer had been negative, either because they were eating things from the garden or they were narrowly avoiding an accident because they were too dumb to be sensible about roads.

(And was the Dungeon Master trying to say something, by having this creature be a deer, rather than something else? If half the stuff in Aerb was built to my specifications, from things I had dreamed up or reflections of my life, then why a fucking deer of all things? Was this just on the level of “hey you used to hunt deer”, a stupid surface-level reference, or was it actual commentary of some kind? There was a point to asking questions like this, which is that eventually I might be able to figure the Dungeon Master out, but I was pretty far from solving that puzzle.)

“Do they all look like that?” I asked Solace.

“Yes,” said Solace. “Because that is the only one there is.” She gave me a smile as I opened my mouth to try smoothing things over. “It’s okay,” she said. “And no, they didn’t all look like that, back when there were hundreds.”

I almost said that seemed like a lot, before remembering that Aerb was ten times as large as Earth, and having tens of them on Earth would have placed them on the far side of the critically endangered species list. Even at their peak, they had been really rare.

“I don’t know much about druids. Or loci,” I said.

“That’s okay.” Solace nodded. “Not many do, these days. Being absent for three hundred years will do that. Druids were never ones for knowledge anyhow.”

“Huh,” I said. “And, is there a reason for that?”

Solace shrugged. “Knowledge is detrimental to the art,” she said. “I gave you wings so that you wouldn’t die from the fall, but that might have been impossible for me if I’d had any concrete ideas..."
about how wings actually work. It used to be a somewhat common occurrence for druids, to go off in pursuit of better understanding only to lose their intuitive connection.”

“So, like a piano player who can only play when they’re not thinking about what their fingers are actually doing,” I said.

“What’s a piano?” asked Solace with a raised eyebrow. Amaryllis had come back to join us, her time nuzzling the deer apparently complete. I assumed that she’d been listening in on our conversation.

“Uh, it’s a musical instrument that you play like this, I said, holding my hands out as though I was about to type something. “You press black and white keys which raise hammers that hit against strings, which then make sound?” (SOC, dump stat, etc.)

“He means a clavichord,” said Amaryllis with a smile. She turned to me. “The tangents are actually blades, not hammers.”

“Right,” I said. “But druids must have some limits, right? I was just wondering what those limits were.”

“Would either of you wish to become a druid someday?” asked Solace. “It might be possible, once this task is complete and the locus can induct new members.”

“Yes,” said Amaryllis. “I think I would like that.” And there I knew she was lying, because the thought of Amaryllis making a commitment to a forest, or the spirit of a forest, or whatever, sent up a bunch of error messages. (To be clear, these were non-literal error messages. I was at a point in my life where I needed to start making that distinction.)

“Then I will choose to demur on that question, Juniper,” said Solace.

I tensed for a moment before some remote part of my brain told me that Amaryllis had already said my name in front of her. “I’m sorry, we never did make our introductions,” I said. “I’m Juniper, this is Mary.” There was a little twist of Amaryllis’ lips at the fact that I hadn’t used her real name, only enough that I knew she got it.

“And who are you, at a deeper level?” asked Solace, still with her kindly smile. “I, again, know almost nothing of you. Three races among the four of you, magic items to spare, and a warder of some skill? There are not terribly many conventional arrangements of people who would suit even that bare bones description. If the four of you really do have a teleportation key, then … well, I don’t know what that would make you.”

“Joon?” asked Amaryllis. I could read the implied question in her voice. Can we trust her?

“It’s complicated,” I said.

I turned to look at the locus. The Six-Eyed Doe, as the game termed it, that was my actual companion, not Solace. And if I were a game master who had a player with the ability to literally see the loyalty levels of everyone on the team, you had better believe I would give them someone their power didn’t work on. The question was whether that meant Solace was meant to betray us, or whether it was a red herring, or whether I was trying to read far too deep into what little of the Dungeon Master’s machinations I could actually, visibly see.

I had made a promise to myself that I wasn’t going to treat people like that, that I wasn’t going to throw anyone under the bus because I doubted that they were real. I had read those kinds of stories, and they almost never worked out right for the protagonist, but it wasn’t just that, it was the idea that if I discounted things as ‘not real’ then I would have to discount my entire life, because I couldn’t
trust any of that either, not even the vividly real ones.

So on her merits, could we trust Solace? No, absolutely not. If I had known that she wasn’t a companion, then I probably wouldn’t have gone into the bottle to begin with. She was a companion’s -- servant? secretary? hand? -- something like those, but that was introducing trust chains into the mix, and I didn’t particularly trust or understand the Six-Eyed Doe as yet either. Solace seemed nice enough, but I wasn’t about to live my life on Aerb on the basis of how nice people seemed when I first met them. That wasn’t to say that I was going to reject the quest, or even reject having her as a traveling companion, but trust had to be earned, if the game wasn’t going to just cough up that information.

“Complicated?” asked Solace. She gave me a small grin. “I’ve been the only druid left on Aerb for the last thirty years. I survived the extermination efforts of the Second Empire. I understand a thing or two about complicated. I won’t ask you to break any silence you feel you need to keep, and Mary, I will confirm that you’re right; I can hear anything that’s said within the domain of the locus.”

“Wait, are you saying that you’re at least three hundred years old?” I asked. “How is that possible? Did you know the Lost King?”

“This body is forty years old,” said Solace. “Young, by crantek standards. When I grow too old I perform the rite of Yaxukasu Axud, which allows me to be birthed again. I have lived for four hundred and eight years, across a number of bodies. The Lost King was before my time, sadly.”

I sighed. “Well, that at least explains how you can be here if the locus couldn’t induct anyone into the grove.” That also meant that she was a source of valuable knowledge, but perhaps not the kind of knowledge that was of immediate use, especially if they were anti-knowledge. “Is healing within the realm of what a druid can do?”

“Oh, of course,” said Solace. “It was what we were most known for. Outside the bottle I am considerably weaker, but inside I can heal almost any injury and cure almost any disease, so long as it’s not too far progressed. Before the Second Empire, people used to bring their sick into the woods in hopes of finding a druid they could plead their case to.”

I frowned at that. “Okay, but wouldn’t it have made more sense to just set up a station where people could come and get a hearing?” I asked. “Why should they have to wander into the woods? I mean why would the druids want totally ignorant outsiders coming in and bumbling their way around?”

“You were right that you don’t understand druids,” said Solace. She gestured to the locus. “It’s order that rankles. Systemization and understanding are anathema to a locus. This world in a bottle has just enough that’s wild and free to sustain the locus, and even then it bucks at me when I go about my work of keeping this place functional.” She ran her hand through her hair. “Do you know your history?”

“I think I can safely say that I don’t,” I replied.

“What you’re suggesting?” asked Solace. “That was how the Second Empire started. They saw the loci and the druid’s groves as resources to be exploited, the domains as places to be penned in and contained. That is fundamentally not how a locus behaves. To study it is to weaken it. To enumerate a druid’s powers is to cause them to fail. That was always what the loci and their druids butted up against, the desire of the mortal species to know and the nature of the locus, which is not to be known.”

If a druid couldn’t use their powers if they understood them, then the first thing I thought about doing was going up a level and trying to figure out what ‘understanding’ meant in that context, and to test
what various things would trigger this anti-understanding mechanism. Obviously going up a level was, to some extent, allowed, right? Otherwise Solace wouldn’t be able to tell us that actually understanding druidic magic would kill it, and she knew enough to know that she would lose power if she actually understood the mechanics in anything other than an intuitive sense. And yet, I was pretty sure that I was edging around something that would be forbidden, or at least that I would be told was forbidden.

“That’s always been my biggest gripe with D&D,” said Arthur. “The magic almost never feels magical, and that’s because it’s bound by rules. Joon solves a lot of that by just giving us weird stuff --”

“It’s the ‘Keep Magic Weird’ initiative,” I said.

“Is that a reference?” asked Tom.

“‘Keep Portland Weird’, right?” asked Tiff.

“Yeah,” I said. I gestured to Arthur to continue. We had seven people for the session, including Craig’s kid sister Maddie, which made it a bit of a madhouse, especially when Arthur was trying to talk seriously about something.

“The problem is that there are rules, and once you know those rules, you can’t be surprised by them,” said Arthur. “It’s a map that has all the lines drawn in, with nowhere left to explore. Wizards are supposed to be magical, but they just boil down to a list of a few hundred spells to choose from. You get the buzz of magic from those spells when you first read them, but after that, it falls flat.”

“You can’t fix that though,” said Reimer. “Not unless you want to go full freeform roleplay without any rules, and that always sucks.”

“That was basically what we did for Actual Cannibal Shia Labeouf, and it worked great,” said Tiff.

“Shia Labeouf?” asked Maddie. She was three years younger than us, not really a kid, but that was how I had always thought of her: Craig’s kid sister.

“No talking when it’s not your turn,” said Craig. She pouted at that. “Whose turn was it?”

“Oh,” I said, looking down at my turn tracker, which was a mess of dry erase marker. I had horrible handwriting. “Tom, you’re up.” (And, as usual, the conversation continued on while I tried to deal with combat and Tom’s questions. I listened in, splitting my attention, unable to contribute without bringing an already-slow session grinding to a halt.)

“You could totally do a purely DM-mediated magic system,” said Arthur. “The player says what they want to do, the DM places a difficulty on it, and then the player rolls some dice. I thought of that in two seconds, I’m sure there are better ways.”

“But the DM is just arbitrarily assigning difficulty?” asked Reimer. “And the player just has to take a guess at how hard it is to actually cast a spell or do whatever unstructured thing it is you want to do? I mean, you’re going to have to introduce rules at some point, even if they’re just meta-level rules like Wish or Miracle, and it’s the rules you dislike.”

“If you had a good DM, I think you could do it implicitly,” said Tiff. “You could do like a social contract type thing, develop an understanding, and then build from there. You’d basically be praying to your god, but the god would be the DM, and maybe he would have his own rules, but you’d never know them, and you’d be discouraged from knowing them.”
“Wanna homebrew it?” asked Reimer with a grin. “If you pitched it, I think Joon would go for it, and then I can cheese the shit out of it.”

“I heard that!” I called out to them. “Tiff, don’t you dare go over to the dark side, stay over in the light with Arthur.”

Nothing ever came of that homebrew plan, which I was thankful for, because I liked the rules. Arthur was right that magic seems a little bit less magical once you stuck everything to a cork board, but it wasn’t less magical for me, because everything I thought up I could make a reality, and that process of making these ethereal ideas into something concrete was one of the things I loved most about tabletop.

I was certain that I was never going to be a druid, and that I would never want to be a druid, and that even if I did want to be a druid, I would probably be powerless within the week because I wouldn’t be able to stop myself from investigating what limits the power had. But there was a bigger problem than that.

“Can I hurt the locus by thinking the wrong thoughts?” I asked. Like, say thinking about the fact that as size increases, volume increases faster than surface area, and the doe just looked like a normal doe without the structural changes necessary to have legs that supported it, and it had six eyes that would require an almost totally different skull from what an actual deer had, and six eyes didn’t really seem like they would help much given the configuration on the head, except maybe for added parallax, and oh god am I killing this deer just by thinking these things?

“No,” said Solace. “You’re trying to pin down what can and cannot be pinned down?”

“I’m just, maybe not suited to this place,” I said. “Or, this variety of magic. I’m a guy who pins things down, by my nature, and if you tell me that it’s mystical, which you seem to be doing, I start to think about all the properties of that mysticality.”

“You would make a bad druid,” said Solace with a laugh. “But no, the things you should be most worried about are telling me how or why something I have done, or am about to do, cannot possibly work, or openly questioning how it did work given some piece of knowledge available to you. As for the locus, it matters more what is done within its domain, and how you see it. It is a thing that values friendships without structure, rather than written or oral agreements. It would never, for example, induct either of you as druids in exchange for your service to it, your service must be given without any preconceptions of trade. If your service is so given, then the locus might take to you, or it might not.”

I looked to Amaryllis, wondering whether she knew that. She seemed like she would make a bad druid too, at least to my eyes, but maybe she was better at the whole gift economy, spiritual guidance, it’s-just-a-show-I-should-really-just-relax thing than I suspected.

“Okay,” I said. “But the upshot is that you’re offering us aid? With no strings attached?”

“Hrm,” said Solace. “I wouldn’t go that far. I will say that my intention is to help you, and it is my hope that it is your intention to help me. I will give you both the material aid and personal effort I believe you require in the pursuit of your goals.”

“But,” I said. “Should you believe that you’re not getting closer to --”

“We’ve accepted already, Juniper,” said Amaryllis. “Or rather, if I understand Solace right, we have already declared our intentions and she has declared hers. I don’t know that there’s more to say on
the matter.”

“Mary is in charge of diplomacy,” I said to Solace with a small smile.

“And that’s something that the four of you do together?” asked Solace. “Diplomacy? If I’ll be traveling with you, will it be to places where diplomacy takes place? I have to say that you seem exceedingly well-armed for diplomats.”

“We’re on our way to the Athenaeum of Speculation and Scrutiny, to learn more about the dream-skewered,” said Amaryllis. “Any assistance in shortening our journey would be much appreciated.”

“And there’s another thing,” I said. “I’ve been having a medical issue with my ribs and my left hand that I’d like your help in fixing,” if you can.

(I was trying my best not to tell the druid what she could or could not do, and why it was probably impossible. This wasn’t a test, per se, though I was expecting that it would give me data either way, and that wasn’t my fault, was it? I was also hoping that there wasn’t a placebo requirement; would druidic magic work less well if I thought it wasn’t going to work? Was I allowed to ask whether there was a placebo effect?)

“Remove your shirt,” said Solace.

I did as she said, with only a little bit of hesitation. The spell that had given us wings had ripped two holes in the back anyway. I noticed a slight change in Amaryllis’ expression as she looked at me, a shifting under the mask of good humor she was currently wearing. I was sure that I looked different from the last time she’d seen me. I was quite a bit more muscular now, having gone from 5 PHY to 7 PHY. I didn’t have any dysmorphia from it, none at all, which in itself was odd, because I would have thought there would be little moments throughout the day when I would look down and be shocked by the changes my body had gone through. The game layer, or the simulation, or whatever, had been kind enough to monkey with my perception of self (which, yes, was disconcerting, but I figured was better than feeling like I had been trapped in the wrong body).

Solace placed a hand on my bare chest. She had a pleasant smile, most of the time, despite being four hundred years old and having apparently suffered through the fantasy equivalent of the Nazis, along with the deaths of everyone close to her and a life of hiding. That smile began to fade as a look of confusion came over her green face.

“You’re perfectly healthy,” she said, not removing her hand from my chest. She frowned. “When was the last time you ate?”

“Oh,” I said, “Uh, that would have been … yesterday morning.” I hadn’t touched the pancakes, bacon, or buttered coffee in the morning. I had woken up from bed to eat something and then gotten sidetracked with Amaryllis. And before that, I’d been high out of my mind on unicorn blood, then passed out, which meant that it wasn’t a great day for remembering to eat.

“Well, that explains the malnourishment. But I don’t fully understand this,” said Solace. She moved her hand, touching me, first pressing her fingers firmly against my side, then going for my arm. She grabbed my left arm, in her hand and peered down at it. “Your body thinks that it’s healthy, but it’s wrong. This is --” She stopped and pulled her hand away, then looked at Amaryllis. “What happened to him, exactly? Does he know?”

Amaryllis looked bewildered at that, and I hoped it was authentic. “I don’t know what you’re thinking,” I said, “But I’m a bone mage. I used the magic of those fifty-one bones in a time of need and whatever it is you’re seeing, that’s the result.”
“Oh,” said Solace. She calmed down somewhat. “I knew that it was your soul, I just thought … I hadn’t considered that you had done it to yourself. I assumed that she was a bone mage, and they can touch the soul …” She stopped and looked at me. “The things the Second Empire did with the soul are one of the reasons that they aren’t looked upon fondly anymore, if you’re really so ignorant of history as you claim.” She shook her head. “I’m sorry, but what’s wrong with you isn’t something that I can fix.”

“Okay,” I said, “I need to put a history book on my shopping list or something.” I paused. “I should warn you that fixing this problem of mine is on our list of things to do, and it’s very possible that meddling with the soul is going to be how that gets done.”

Solace blanched, her light green skin going a shade of lighter, making her look sickly. “I was afraid of that,” she murmured. “But yes, that does make sense.”

“It makes sense in terms of the Deep Searching and why you were brought here,” said Amaryllis. “You think salvation might take dealing with the soul of the locus.”

“Does a locus have a soul?” I asked. “Or, sorry, is that one of those things that I’m not supposed to ask?”

“They do have souls,” said Solace. Her face was set in a frown. “The Second Empire was fastidious in its attempts to understand the world. Never let a death go to waste, they said.” She glanced over to the six-eyed doe, which was still standing close by. “I’d prefer that we speak of this elsewhere.”

I looked up at the top of the bottle. “Is there a better way out, or are we going to grow wings again?”

“I’ll admit that was mostly for effect,” said Solace. “I didn’t have the measure of you as well as I do now. I wanted to show you this place, and its majesty, which is just a scrap of what the locus once had, and will have again.”

(I found it odd and somewhat off-putting that everyone just called “it” “the locus”. Were names too much of a constraint? The game called it Six-Eyed Doe, and that was what I was going to go with, at least within the privacy of my own head. It also seemed dumb to call a doe an “it” instead of a “she”, considering that it was already gendered, but whatever.)

Solace stepped over to the tree-house, which I took an opportunity to glance inside as I followed. It was more ordered than I had expected, given what Solace had said about the nature of druids, but the order was organic, with little out-of-the-way cubbies, stacks of fruits and furs, and nary a straight line in sight. Solace went up next to the door and took her staff in hand, then tapped twice on the wood. It split along the grain, revealing a long tunnel through the wood that extended, fourth-dimensionally, straight through the entire width of the tree.

“Down the rabbit hole then,” I said with a breath.

When Solace started walking down the dark tunnel, I followed after, with Amaryllis right behind me. As soon as she was past the entrance, it sealed shut behind me, leaving me with a claustrophobic feeling and a sudden spike of panic. I was about to light my fingers on fire when I saw a swarm of yellow-green dots appear in front of me, which at first reminded me of the fireflies I’d tried to catch with Arthur when I was little, before I realized that they actually were fireflies. As more of them appeared, I could see by their light that they were coming out from Solace’s long, leafy cloak. They kept on coming, flying up and around us, some of them landing on the roof of the tunnel, until there was enough light to see by.

(I was fairly sure that this was also meant to impress us with a blatant display of magic, just like the
winged glide down into the bottle, and I have to say that it was working on me.)

We went what felt like a hundred yards before a shaft of light opened in front of us, which eventually resolved itself into an ordered row of flowers once my eyes adjusted to the light. Solace stepped out into it as the fireflies swarmed to her and made their way back under the leaves of her cloak. When I stepped out of the tree after her, I looked back to see the long tunnel seem to emerge from a tree that couldn’t possibly contain it. When I looked at the field, I saw Fenn and Grak standing there over the bottle. Fenn had spotted us, and was giving us a wave.

“Can you go ahead to the others?” asked Amaryllis. As soon as she stepped out of the tree, it folded itself back up, looking no different from all the others. “We’ll be along in a moment, but there are a few things I’d like to discuss in confidence.”

“Certainly,” said Solace. The crantek gave us a short bow and strode back to her bottle without a look back.

“So,” said Amaryllis. “It’s complicated?”

“Yes,” I nodded. “The locus is the companion, not Solace herself. Grak’s glasses show her as purple, which I have to take as a good sign, but I would be more confident that we could trust her if she weren’t a minion.”

“She has power,” said Amaryllis. “Her needs are straightforward, and she’s not making many demands. Actually, her goals for the moment are directly aligned with our own; she wants you to be stronger. If it’s alright with you, I’ll probably reveal my true identity to her when we make camp for the night.”

I startled at that, because the idea that Amaryllis was asking me was a little bit odd. “Sure,” I said. I hesitated. “How much of that was true?” I asked. “About you wanting to be a druid? Any of it?”

“The things I want and the things I can have are very different,” said Amaryllis. She reached back to feel the holes in her shirt. “I would like to have a new shirt that doesn’t make me look like an ass, but I doubt that Fenn will be able to resist the urge to show off to our new travelling companion.” She sighed. “I would like to be a druid, to wander the woods in solitude, to have that simple, uncomplicated --” she looked at Solace, “That’s not right, looking at her, I didn’t meant to diminish her sacrifice and struggles. Druids in the fairy tales are different. Maybe that was a safe dream because it was unattainable.” She looked to me, staring at me with those pretty blue eyes, perfect lips slightly parted. “Are you worried that I’ll let thoughts like that get in my way?”

“No,” I said. “The opposite.”

“Oh,” said Amaryllis. She turned back toward the others. “Come on, I don’t want them to think that we were conspiring.”

“We were conspiring against you!” Fenn said to us as soon as we rejoined the others. “Grak started it. Do you know what he said as soon as you left? He said, ‘Now we finally have a chance to speak freely’! His first joke!”

“I understand jokes,” said Grak. “It was not my first one.” He looked at Fenn with a frown. “I regretted it immediately.”

“Solace was just telling us what a wonderful time you all had in the bottle,” said Fenn. “We’re all still friends, right? Everything is copacetic?”
“Right,” I said. “We are, uh, not at full disclosure though, regarding the two major things we’re keeping under our hats.” I paused and realized that I could potentially have been talking about a few different things. “One regarding me, one regarding Mary.”

“Trust takes time, I understand that,” said Solace. “Mary, you were asking if I could assist in travel? How would the four of you feel about being birds? We could be at the athenaeum before nightfall.” Solace scooped the forest-in-a-bottle up and put it in her cloak, a process that seems to be governed by a flourish of sleight-of-hand more than magic.

“That sounds lovely,” said Amaryllis. She turned to Fenn. “Fenn, my shirt was ripped, and I would like a new one, please.”

Fenn broke out into a grin, which she tried and failed to suppress so she could make a serious face. “Hrm,” she said, wiggling her gloved fingers, “No, no, no -- hah, that’s the one, perfect for our circumstances.” A folded pink shirt appeared in her hand, which she tossed to Amaryllis.

I watched closely as Amaryllis unfolded the t-shirt to get a look at it. It was a single word with an exclamation point, in bubbly, curled writing, with sequins and glitter on it. ‘Princess!’, the shirt declared.

Amaryllis stared at it with a blank face for a few seconds before bursting out laughing.
Solace went around to us one by one, tapping her bird-skull wooden staff upon our heads. The tap produced dense mist, which fell down like a sheet to cover the body, and when it cleared, there was a bird standing there instead. I watched that happen to Grak and then Amaryllis, as Solace moved around the circle. Their bird forms looked almost identical, with her being a bit more sprightly and him a bit thicker. The color of the feathers was a dark black, with white on the belly and the lower half of the head.

“What kind of bird is that, if you know, or if that question isn’t indelicate to your, um, profession?” I asked, as Fenn was tapped on the head and shrouded in mist (or possibly, odorless smoke, if it had physical substance at all).

“Don’t really know,” said Solace with a raised eyebrow. “We don’t put much emphasis on measurements, and that aside, how fast or slow an animal goes -- even one of the mortal species in animal form -- is not something that can be reduced down to a simple number. People do it, but it’s pointless and, anyway, doesn’t ever truly match what we see in the world, where there are a million things that might affect a swallow’s flight.”

“I really would make a bad druid, because now I’m trying to think about all the various factors that could influence swallow flight.” I was also thinking about relative levels of error and confidence intervals, but that was probably not something that the druid wanted to hear about.

Solace nodded happily, then tapped me on the head without another word. Mist poured down in front of my eyes, and when it cleared, I was a swallow, with no obvious transition between the two states, not even in terms of proprioception. Had my arms become wings? I lifted them, and it was as natural as if I’d been born into them, not like I had thrust my hands down into a bird suit and was controlling the wings from a distance. I ran forward a little bit on clawed feet, then flapped up into the air.

It took us two hours to get to within striking distance of the athenaeum as we followed the railroad tracks. It was visible almost from the first moment I took off though, as a beige smudge on the top of a singular purple mountain, one which sat a bit off from the rest of the range, at the end of a peninsula. Beyond that was ocean, wide and vast. That rock formation was something I didn’t think you’d ever see in nature, almost aggressively so. As we got closer I saw a city nestled at the mountain base among the trees there, and just barely, the thin line of lights that shone from the cable car lines.

We landed together in a copse of trees beside the main road into Boastre Vino, which ran parallel to the train tracks. There were barely any farms around the place, nor any visible industry, just woodland; it made me wonder at how much of Aerb was simply unspoilt. Twenty billion people across two billion square miles meant that at its peak (which it was now well below) Aerb only had the population density of Earth in the 1930s. Modern day Aerb had a fourth of that, and I wasn’t sure how much of that decline was recent, but it seemed like enough that maybe nature would have
started the reclamation process.

Solace changed back first, then tapped each of us with her staff, returning us to our natural forms one by one.

“We should be a few minutes' walk from the city,” said Amaryllis, once she had a mouth instead of a beak. “Juniper, you still want to do this the legitimate way?”

“Yes,” I said. “I’m dream-skewered, so I have a reason to go to the athenaeum, which means that they should let me in and hopefully answer my questions, right? That seems faster and safer than trying to be duplicitous. I won’t be institutionalized or murdered or something?”

Amaryllis shook her head. “From everything I’ve read, the dream-skewered aren’t really confined, because this is the place that’s most like home for them, with an Earthian diet and others that believe they’re from the same place. There’s not a life for them, outside the athenaeum walls. That freedom also gives the researchers a better rapport with their subjects. You should be safe. We’ll ask around before we do it though.”

I let out a breath, trying to drain myself of nervous energy. “And do you think that you’ll all be allowed up with me?”

“Yes,” said Amaryllis. She looked down at her shirt and smiled at ‘Princess!’ staring up at her. “Clearly I already have the perfect disguise. We’ll spend the rest of today in the city, gathering information, making sure that it’s safe and trying to figure out a cover story, if we need one. I wouldn’t want you going up there alone.”

“You think they’ll let us up armed and armored?” asked Fenn. “Especially the one they think is brain-damaged?”

“We’ll see,” said Amaryllis. “I would suggest armed but not armored. Half of our weapons can be hidden away in one form or another. They might check us, but I doubt it, and in the worst case scenario, we’ll have to put some of it away in a secure vault.”

“A very secure vault,” said Grak with a nod.

“We have Sable to store things in,” said Fenn.

“I don’t want to pin everything on that glove,” said Amaryllis. “It’s a single point of failure.”

“I won’t leave my cloak, for obvious reasons,” said Solace.

“Which in the worst case means we might be splitting the party,” I said with a grimace. “Which didn’t work out well for me last time.”

“And what happened last time?” asked Solace.

“I’ll tell you about it over dinner tonight,” said Amaryllis. “We should do some reconnaissance and make camp at a hotel anyway. Besides, we skipped lunch today.” I grimaced at that reminder; I still wasn’t hungry, though I was feeling a little light-headed.

We strode forward, until we came to the familiar walls that every city so far, save for Cranberry Bay, had up around their borders. Here they were a bit taller and more finely made, tailored as though meant to impress anyone on the approach, even if they were facing the woods. The main entrance was some distance away, just barely visible, but I had seen it from the air and it looked like there was a checkpoint that we really didn’t want to go through, not if it meant trying to explain ourselves.
Grak got out his monocle and looked the wall over for a bit before letting us know that it was unwarded.

Solace stepped up to the wall. “Over or through?” she asked.

“How --” I began. Amaryllis gave me a brief shake of the head. “We should see what’s on the other side first,” I said. “Once we’ve slipped in we should be able to achieve relative anonymity, it’s the breach that carries risks.” It might have been better to do it as swallows, but the inability to communicate with each other was a complicating factor.

Solace nodded and pursed her lips for a whistle, then held out her staff horizontally. A few seconds later, a variety of birds landed on the staff, and she tweeted at each of them in turn, causing them to fly off. It didn’t take long for them to return, though I waited impatiently all the same. Solace listened to each of the birds in turn, smiling gently at them, and when they had given their report, they flew off, one by one.

“Directly through this wall is an access alley with an entrance out onto the city streets,” said Solace. “There is no one there at the moment, though that may change.”

“The birds said all that?” I asked.

“Oh, I have no idea what they said,” replied Solace. She laughed at my expression. “It’s been some time since I’ve traveled with other druids, and even longer since I’ve shared the company of those outside the grove. I’ve missed it.”

“Keep your questions to yourself,” said Amaryllis. “I don’t want to sound mean Joon, or like I’m trying to tell you what to do, but this druid is an asset, and second-guessing every little piece of magic you see goes directly against our interests. Okay?”

“Yeah,” I said. “I get it, it’s just,” I bit my lip, “It will take some adjusting to, that’s all.”

Solace stepped toward the wall, licked a finger, and ran it down in a straight line from the top of her reach down to the packed earth. The solid stone grumbled slightly and then parted way for her, and she stepped forward without seeming to think about this at all. I followed after, with my Anyblade gripped in my hand as a dagger. I had Ropey in the bag slung on my side, freshly killed fairies in my bandolier, and bones at the ready in a second bandolier in case I needed them.

It was fortunate that there was no one in the alley, and that we made it into the city proper without anyone the wiser, but there was a part of me that kept thinking about how close I was to leveling and how likely it was that a proper fight would get me there. I wasn’t about to antagonize the city guard just to get that fight, but I still itched for it, just a little bit, if it would push me over the edge and into the next level.

We did draw a few stares as we moved through the streets, which I thought was mostly due to Solace’s cloak, or perhaps the five of us moving together. I was glad that we weren’t wearing armor, because almost no one else was either, and those that were definitely drew the attention of everyone they passed.

“You know, I could put your cloak in my glove,” said Fenn. “That would probably save us some eyeballs.”

“Probably,” said Solace. “But no thank you.”

After stopping to ask for directions twice, we came to a tall hotel, where Fenn rented three rooms for us, handing over what looked like a thick stack of cash to the woman at the front desk.
“Alright,” she said as she returned to us. “Our business trip has begun in earnest. I have two of the rooms for two nights, which I think should be all the time we need here, and one of the rooms for three solid weeks, so we can have a secure place if we need to. Mary, you and Solace have some things to discuss tonight, so you’re together, Grak, you snore, so you’re on your own, and Joon and I have twin beds together.”

“Fine by me,” said Amaryllis, without so much as batting an eye. Studious indifference to Fenn and I sharing a room, or actual indifference? I had no idea, and it irked me that I didn’t know. Maybe I wanted her to have at least some reaction. “In the meantime, we should split up.” She stopped and looked around our small group huddled together in the hotel lobby. “Sorry, we’re still a democracy.”

“Sure are,” said Fenn. “I have some things to sell and things to buy, and I’ll be the one to keep an eye on Juniper, because gods forbid he gets discovered as a mental incompetent in these parts. At least, that’s my vote.”

“What could you possibly have to buy and sell?” asked Amaryllis.

“I was hoping to find a buyer for unicorn meat,” said Fenn. “We spent a fair bit of time butchering that thing. I’ll hold back a bottle of blood for us, but we’ve got a few from when we drained the thing, and they don’t go bad fast enough to be worthless.” She looked to Solace. “We killed a unicorn, it was no big deal.”

Solace nodded, which I gathered was not the reaction Fenn had hoped for. “So you have an alicorn?”

“I guess we can sell that too, if we have you,” said Fenn. She smiled at Grak. “Looks like you’ll get your wish there.” Right, because he gets a third of the loot.

“I would appreciate it,” said Grak. “I’ll go under the mountain and speak with the dwarves there. There’s a sizeable city beneath the mountain, Lalon Dohore. It’s been some time since I’ve been with my kind and I can ask them about affairs at the athenaeum.”

“I would prefer to walk the city, if we are going to wait,” said Solace. “I believe I can be worth more on my own, without questions.” Asked of her, or by her?

“Then I’ll try to figure out admittance procedures for the dream-skewered,” said Amaryllis. “Fenn, once you’ve sold the unicorn parts, can you do that too? We don’t know quite what we’re here for, not in the long-term, and it might be something that wouldn’t be disclosed along official channels.”

“Beat the information out of some scholars, got it,” said Fenn.

“And if Larkspur has a way to track us?” I asked. “If we split up and then he finds us, somehow?”

“Then we have a very serious problem,” said Amaryllis. “Unless you think you can beat him, run away. Not to here. Instead, find someone you can pay to run a note to the hotel. Sound good?”

We split up then, and I said a small prayer to the Dungeon Master, hoping that we would reunite without incident.

Fenn and I walked together, making our way through the typical Aerbian jumble of streets that refused to meet at the same angle twice. This place was smaller than Cranberry Bay by a fairly large margin, but it still had more than enough in the way of sights and sounds. Fenn stopped at a stall, which was selling what looked to my eyes like a tentacle with all the suckers removed, placed on a stick, and then roasted with some kind of dark sauce. She got four of them, and handed me three.
“Eat,” she said. “You’re going to be weak if you don’t eat, and if you’re weak, I might die, so I don’t care how much you don’t want food, eat to save my life.”

I ate. The taste wasn’t bad, but I was pretty sure that nothing would have excited my taste buds. “I’m glad we have some time alone,” I said. “There was something that I wanted to talk to you about.”

“Eat,” Fenn repeated. She watched as I took another bite. “And what was it my little hooman had on his mind?”

“I need to know what I said to you when I was out of it,” I said.

“Hmmm,” said Fenn. “Grak and I swore a very serious vow of silence on the subject, and he’s made a joke, thus redeeming himself in my eyes, so I’ve decided not to betray him after all.” She paused. “Maybe that will be our thing, me deciding not to betray him after all, over and over again? We’re up to several times already, and I’ve only known him a week.”

“Fenn, I’m serious,” I said. I tried to eat quickly, so I wouldn’t have to think about it sliding down my throat. Was the loss of appetite getting worse? I’d increased END, but I’d also increased muscle mass, which meant that I would theoretically need more calories, and I was starting to worry that long-term damage was inevitable. “Your Loyalty went from 10 to 16.”

“Oh?” asked Fenn. “I thought it might have gone up.”

“And … why would you have thought that?” I asked.

“Well, I’m more loyal to you now,” said Fenn with a beaming smile. She leaned in close for a whisper, with bright, playful eyes. “It’s because of the things you said.”

“That’s not fair,” I replied. “Really not fair. You were worried about your loyalty, about being a puppet. This is something that we should talk about.”

“I’m less worried now,” said Fenn with a shrug. “Because of the things you said.”

“Okay, but,” I frowned. “I still think it’s not fair, because it’s like our relationship progressed without me even being aware of my half of it, and given how much time and effort it took to get you up to 10, --”

“Effort?” asked Fenn. “Well, you sure know how to make a half-elf feel special. I didn’t know that my friendship was so arduous.” But she was smiling as she said it, and I would have smiled too, but it felt like I had been thrown off a boat and didn’t know which way to shore.

“Fenn, you have to at least give me part of it,” I said. I felt my chest constricting. “I’m really worried that, I don’t know, that I eroded away a part of this person that I really care about. It’s not funny to me.”

Fenn watched me for a moment. “That is the nicest thing that anyone has ever said to me,” said Fenn. “Well, aside from some of the things that you said to me when you were high on unicorn blood.”

“So that was it?” I asked. “I said some nice things?”

“And some not-all-that-nice things,” said Fenn. “Oh, those I can tell you, I don’t think Grak would mind so much.” I waited and ate at the last of my tentacle sticks. “You told me that you didn’t like my ears.”
I winced. “I think I can explain that,” I said. “I mean, it’s not that I don’t find them aesthetically pleasing on you, it’s that, ah, more that I find them neutral now, maybe? I did like them when we first met. I mean, mostly because, I don’t know, they were distinctive. They have a nice curve. I mostly don’t notice them anymore, but when I do it’s just, they’re there … you know?”

“And if you had the choice between me having normal human ears and me having elf ears, you would first ask me what I wanted to have, and then you would pick that, or if I really, truly, had no preference whatsoever, then you would maybe be slightly more comfortable with me having human ears, not because you dislike the elf ears, but because you don’t like them, which is a very important and meaningful distinction, but you actually aren’t all that into ears anyway so it’s not worth talking about.” Fenn smiled at me. “Was that your train of thought, more or less?”

“I already said all that?” I asked with a grimace.

“That’s the short version,” said Fenn with a nod.

“I’m sorry, it’s not something that I would ever bring up if I weren’t, again, not in my right mind,” I said. And yet her loyalty jumped six points anyway.

“You say six points difference?” asked Fenn. “I think that was worth a point, maybe two.”

“Huh?” I asked. “That was worth positive points?”

“Well, I would explain it to you, but I don’t want to bring the mood down,” said Fenn.

“I know this is all fun and games to you,” I said. “But I actually am worried that part of your personality got overwritten on accident.”

“Ho hum,” said Fenn. “Fine, but it’s long, and I’ll wait until after we’ve sold the unicorn meat, because we are here.” She gestured to the large market building in front of us, where the smell of meat and blood was coming from. I could see pallets laid out with a variety of meats on ice and large fans blowing cool air around.

I found it somewhat difficult to care about the meat market. Half of the stuff there came in refrigerated, via containerized teleportation, where it was then sold off in a pseudo-auction system. The variety of colors was astonishing to me, with a great many meats having un-meatlike colors: rich browns, vibrant greens, and a variety of eel, laid out in strips, that was electric blue. Most of the meat that came into the city was in the form of simple, cheaply farmed animals, and that kind of thing wasn’t sold by auction, because it was brought in by the ton every day. The meat market was full of all of the weird animals from around Aerb that some mortal species or another considered a delicacy, which were worth the price of teleporting in. Hence our interest.

Fenn talked to a few sellers, who each seemed ready to brush her off until she held out her hand and made a giant refrigerator appear from thin air, filled with ice and unicorn parts (this was quite a surprise to me as well, as I had assumed that the meat had been sitting by itself in extradimensional storage, degrading until it was close to worthless). The unicorn meat was, as it turned out, a delicacy, one prized by the elves, a fact that Fenn seemed to have known well ahead of time.

“We still want the bones,” I said once she was about to agree to a transaction. “It might be possible to extract unicorn magic from them.”

“I want them too,” said a burly man with rocky growths on his face. “You want the bones, I can do the butchering for you, but labor comes out of your pocket, and the price is worse.”

A new round of negotiations began, and I mostly didn’t pay attention. We were going to get more
than a hundred thousand obols out of this, which was far better than I had thought, and I worried that I was going to screw things up if I let some expression come over my face. The money was pretty worthless given our current situation, because we already had millions that we couldn’t really do that much with. The thought of just being able to buy whatever we wanted was a little bit astonishing.

“Alright,” said Fenn, shaking the hand of the fleshmonger. She turned to me. “Now we just have to wait for the butchery.”

“You were saying something about killing the mood,” I said.

“I was just a tiny bit hoping that you would have forgotten,” she said with a sigh. “When is that Larkspur going to show up anyway?”

“FENN,” I said. “My god, it’s like pulling teeth.”

Fenn winced. “Okay, okay. So.” She looked around for a bit. “So I was mostly solitary, following the official end of my childhood, but I did have, oh, let’s say five proper boyfriends in my time as a young woman, which extends to this very moment. Males, for whom I was more than a fling. Two were ‘any port in the storm’ types, who found my hybrid nature off-putting but not so much that they were willing to give me a pass, and those relationships both ended because whatever I was getting from them, it wasn’t worth the occasional abuse I got in return, or the way I was hidden from their friends and family, or … yeah.”

“Ah,” I said. I licked my lips and tried to think of something sympathetic to say, but nothing came to mind. “And the other three?”

“Elf lovers,” said Fenn with a shrug. She was looking at the ground, not at me. “All different about it. One was a collector, the kind of guy who wanted to experience a ‘woman of every flavor’, and I didn’t learn that about him until after he left town. I had liked him, and I’d been tricked by his pleasant words into thinking what we briefly had was something other than just a mark in a column. Another man was always stroking my ears, touching them until they were sensitive and painful, and … just pushing me toward this idea he had of me, rather than letting me be myself. He had this obsession with elves, or at least idealized elves, like my mother did, and it churned my stomach after a time. And the third -- did you read The Book of Blood?”

“You told me not to,” I said.

“Well, that guy is the reason why,” said Fenn. “He seemed normal enough, at least by my standards, or the standards I had then, and it was going well, but when it came time for us to have sex, after I had undressed, he was there between my legs, staring, poking, and prodding. Like I was just this thing to him. I can’t even describe how revolting I felt. Maybe he thought he was … I don’t know.” She paused and took a breath. “I ended things with him then, but not before seeing his personal copy of the book sitting on the shelf, with a little bookmark sticking out of it.” She looked up at me. “I know you have a bunch of crazy ideas about what that book might say about half-elves. You explained your theories to me.”

“And … you found that endearing?” I asked.

Fenn gave me a small laugh, and I could see that her eyes were slightly watery. “A little bit? Maybe?” Her voice was slightly shaky. “You were very sweet about it.”

“Do you need a hug?” I asked. Fenn nodded and moved toward me, and I wrapped my arms around her. It wasn’t exactly what I would call romantic, there in the cold meat market with the smell of meat and blood in the air, and the hum of commerce, but it was still nice.
“I’m not crying,” she murmured into my shoulder.

“Either way is okay,” I said. “I’m sorry those guys were shitty to you.”

“Yeah,” said Fenn. She breathed out a little bit and gave me a small kiss on the shoulder. “It’s like pit fighting.”

“We don’t have pit fighting on Earth,” I said.

“Earth sounds so lame,” murmured Fenn. “Well, you see these pit fighters, and they’re beating the crap out of each other, and one of them loses, but they both go on to fight again later, right? And you can take losses as a pit fighter, that’s just fine, because you can heal up and fight again. But sometimes you’ll see a guy in the pit protecting his right side too much, even though he hasn’t taken a hit there yet, and the reason is usually that he got hit hard enough one time that he’s been worried about another hit like that ever since. Or maybe it wasn’t just the one time, but a bunch of losses in a row, all piled up, and he’s healed from them, but he’s got this thing in his mind where he thinks it’s this eventuality that it’s going to happen again, like no matter the fight he’s going to get this strong hit coming at him from the same place it’s come from before.” She pulled back from me, first to look in my eyes, then to go stand a bit further away. “Thank you for the hug.”

“Anytime,” I said with a smile.

So of course she moved back and wrapped her arms around me, and I wrapped my arms around her. “You are so shit at negotiation,” said Fenn. “It’s actually kind of sad.”
At Arm's Length

Things were a little bit awkward between us after that. I kept wanting her to crack a joke, but she was being very serious as she took payment for the meat, and as we carted the bones over to a cleaner. It was roughly eight thousand pounds of animal, which was spread across no less than four different large refrigerators.

“So you planned this out when you knew that we were going to be going after the unicorn?” I asked.

“I have my own life beyond our little group,” she said.

“Right, but we haven’t actually divided up the money, except for Grak’s share,” I said. “So I have at least a little interest in the schemes that you’re pursuing, if there’s an investment involved.”

Fenn raised an eyebrow. “How dare you accuse me of having actually paid for things,” she said.

I opened my mouth to protest, then closed it. “I think you were perhaps the worst person that glove could possibly have gone to.”

“Or I’m the best, because I think ahead to what our needs would be,” said Fenn. “I don’t particularly like stealing, I’m more into looting, but if I see an opportunity, I’ll take it.”

“And Sable must give you a lot of opportunities,” I said.

“Like you wouldn’t believe,” said Fenn with a grin.

The meat market had a bone-cleaner, which turned out to be a translucent green jell in a reinforced tank. An anthropomorphic raven took our coin and dipped the bones into the ooze, which bubbled slightly and stripped them clean of any lingering meat, fat, cartilage, or ligaments before the raven pulled them out with a pair of long-handled tongs. This was the sort of thing that I had always dreamed about seeing, not the intense displays of magical power, but someone using what was probably meant to have been a monster in a dungeon somewhere for a mundane task. One of the things that I liked about Aerb was that it was settled and lived in; the first thing that I would have thought of when I came across an ooze like that was domesticating it for use in the bone trade, and someone else had already had that thought, and done the domestication, and now it was just part of the fabric of the world.

After the bones were cleaned and safely stowed within the glove (with two of the smaller ones slotted into my bandolier), we went on our way again, off to find a buyer for the alicorn. The raw magic of the glove had drawn fewer stares than I had expected, though it had drawn a few. Magic wasn’t exactly common, but it wasn’t rare either, and even if magic was distributed along a power law, that meant that the average person still knew a few people who would qualify for the title of “mage”, and few people who held at least one magical item. I imagined that the glove would be more extraordinary to someone who understood the whole of magic across Aerb better, as I was starting to, because it was really, ridiculously powerful. Maybe you wouldn’t understand that, if you hadn’t even read the Commoner’s Guide series.

“So, I hate to prod at things,” I said. “But I’m given to understand that the thing with the ears you reacted to because … because I don’t really see you as a half-elf and forget about the fact that you’re technically a different species half the time, right?”

“I guess,” said Fenn with a shrug. “It sounds dumb when you put it like that. Like I like that you’re inattentive.”
“Well, you also said that was probably worth only a point or two, not six, so I’m left wondering where the other four or five came from,” I said. That assumed that she was right at all, but there wasn’t really a point in second-guessing her own internal sense of loyalty, not if I didn’t actually have numbers to compare it against.

“I’ve already said too much,” replied Fenn. “I joke, but Grak and I really did decide that it was for the best that we keep our silence. He’d be awful disappointed in me.”

As we walked, her arm slipped into mine, and she wrapped her gloved fingers around my bicep. I tensed for a moment, thinking that she was going to send me into her glove for some reason, then remembered that it took an act of will on her part, and sometimes people used their hands for things unrelated to powerful magic. After that I tensed for a different reason, which was the closeness she was showing with me. I liked her, I really did, and it was clear she liked me back, but I’d fucked up every relationship I’d ever had, romantic or otherwise. What she’d said to me about pit fighters protecting against a blow they’d felt one too many times before rang far too true, enough that I’d first thought she was talking about me, not her.

“Well that’s why women in fiction are virgins so much of the time,” said Tiff. “It’s this purity obsession that Western culture has, where men want women to be basically untouched by anyone so that they can be the first, so that one man will just be the focus of her sexual energy for the rest of her life, and she’ll be unable to compare him to anyone else.” She held up a hand in Reimer’s direction. “And yes, I know all the evo-psych reasons for that, doesn’t mean it’s not kind of screwed up.”

(Part of the subtext here, which only Tiff and I knew, was that we’d had sex for the first time a few weeks prior, which was the first time ever for either of us. I would guess that was why the topic, ostensibly about the unfaithful Duke of Lagrange and his plot to kill the party, had turned to the concept of virginity in popular culture.)

“Well, if my part in the conversation can just be assumed, then good, I don’t have to say it,” said Reimer with a smile. “But men and women have different evolutionary reproductive strategies and everything you see is part of that.”

“I don’t think that’s why women in fiction are usually virgins,” said Arthur, setting his can of pop down on the table, “Tiff’s thing, not Reimer’s. I think it’s the same reason that young protagonists are orphans.” He sat back in his chair just a bit without continuing.

“Oh,” said Craig, “That reminds me, I made bingo cards.” He reached into his backpack and pulled out a sheaf of papers, each one printed with a five-by-five grid with words in each space. “You can all put an X in the square that says, ‘Arthur sets up obvious bait’.”

“This had better not be why you were late,” I said.

“This is amazing,” said Reimer, looking over the sheet and making a few marks. “Does that one count for ‘Joon complains that Craig was late’?”

“Obviously,” said Craig with a smile my way.

“‘Tiff says that she’s not a feminist’, do I really do that?” asked Tiff. “I mean, I don’t consider myself a feminist --”

“Count it,” said Craig.

“-- I didn’t think that I said it that much,” finished Tiff with a kick under the table in Craig’s direction that hit me in the knee.
“The Duke of Lagrange looks at the four of you in incredulity as you consult these sheets of paper,” I said.

“Joon tries to get the game back on track’, this literally has everything,” said Reimer.

“Arthur, why are virgins like orphans?” asked Tiff. “I’m not okay with leaving that dangling.” She glanced at me. “Sorry Joon.”

“I’m glad you asked!” said Arthur with a gleeful smile. “Well, the reason that you see so many orphans, besides setting up the various orphan plots, is that if you’re writing a book or screenplay you always have to deal with the parents question somehow, at least if your protagonist is a teenager or young adult. Parents are inconvenient to a lot of plots, because the audience is left with this question about why the parents aren’t important or being brought up, and conservation of detail means you can’t just say, ‘oh, well he didn’t like his parents, or they kind of sucked’, because then the audience starts to think that’s important. So, writers just do the easy thing and kill the parents off. That can either tie into the plot somehow, or just allow the character to start as a blank slate, without having to take up screen time. And in this analogy, prior relationships are like the parents.”

I looked around the table and tried to think about character backstories. No one but Arthur had defined parents, siblings, or prior love interests. There was some baggage, quests that stemmed from their backstories, falls from grace, things like that, and for Tiff and Reimer, explicit dead parents, but it was all stuff that could reasonably be expected to be resolved, if the game actually went on long enough.

“And you don’t think it has to do with a culture that places importance on purity, innocence, and naivete, at least in women?” asked Tiff with her arms crossed.

“That’s a bingo,” said Craig. “I think I made these too easy, version two will be better.”

“I think that’s part of it, certainly,” Arthur said to Tiff. “But I also think that if I were a screenwriter faced with making a 90-minute movie, and I had the choice between having a one-line, ‘I’ve never done this before’ or having this whole long thing where I explained what both parties were bringing into their new relationship, I know what I would choose. Virgins are narratively convenient.”

“Wait,” said Reimer to Craig. “Let me see your sheet, how’d you get bingo?”

“There and there,” said Craig. “Arthur and Tiff have a long disagreement on gender, sex, -- see, I made them different things, just for you -- race, or socioeconomics. And the other one was ‘session goes for 30 minutes without even tangentially engaging with gameplay’.”

“I tried,” I said.

“Yeah, I marked that,” said Craig with a grin.

It was only after the session, when Tiff was driving us to her place, that Tiff picked the thread of conversation back up, this time with just me and her in the car.

“It kind of bugged me, what Arthur was saying,” she said. “About relationships being baggage.”

“Yeah?” I asked. “I think he was mostly talking about narratives, not real people. For people, the narrative starts when you’re born and ends when you die, and usually it’s not very compelling.”

“Disagree,” said Tiff. “For other people, the narrative starts when you meet them, and then you have infodumps with each other to get them up to speed on the plot thus far, which basically boils down to where they are in whatever plot threads they have going on. In that context, baggage is all the
existing plot threads that everyone just has to acknowledge will never get solved, because there’s no way to solve them. So Arthur is looking at these past relationships as not being character defining arcs that happened in the past, but *unresolved threads* instead.

“I’m going to be honest, I don’t really have a dog in this fight,” I said. Maybe it was just who we were as people, or because I was a guy and she was a girl, but everything had changed for me the night we’d first kissed, not when we had sex. It wasn’t a non-event, at all, but the kiss had actually felt transformative.

“Yeah, I know,” said Tiff. She tapped her hands on the steering wheel. “Just venting. I kept thinking about you, and this thing between us, and how it feels like I’m more the person that I’ve always wanted to be now, you know? And I don’t want that diminished as mere baggage.”

---

*I’m worried that I’m going to fuck things up with you. No, too direct, maybe too heavy. I’m worried that as soon as we start dating, or whatever the local equivalent of dating is, or whatever resembles courtship for two people who are inextricably bound to each other and together pretty much all the time is, whatever you’d call that, or whatever that would be, I’m worried about fucking it up basically as soon as that starts. And I’m worried that if I don’t make a move soon, then you’ll think that I’m never going to, and that would constitute fucking it up too.*

“Did Grak actually agree to a pact of silence?” I asked, instead of saying any of that.

“Sure did,” smiled Fenn, squeezing my arm.

“And why would he have agreed to that?” I asked.

“Well, you’d have to ask him, but he wouldn’t tell you, because that’s covered by the pact about pacts we made,” said Fenn.

“I don’t believe you,” I said.

“It wasn’t my idea, I’ll have you know,” said Fenn. “He’s a warder, their job is to think about what kinds of threats a person might face, not just to put up wards where they’re told, though some of them do that too. So when he agreed that it was better to just not talk too much about all the things that you and Mary said, he also covered his bases and said that if we weren’t going to talk, then we shouldn’t talk about why we weren’t talking. Which, now that I think about it, is probably what this is.”

“No,” I said, “You’re talking about why you made a pact about a pact, that’s totally different. And you broke your silence before, so ...”

“Oh, but Mr. Smith, I feel ever so guilty about that,” replied Fenn with an innocent expression. Then her face changed from playful to serious and she squeezed my arm tight. “Deep breath.”

I took in a deep breath and then I was in the void of Sable once more, this time without a breathing apparatus to give me more time. The ones we had were too bulky to fit in my messenger bag, and I had thought that preparing for the specific scenario where I didn’t have enough time to have Fenn get one out of Sable was too fringe to justify me putting one in a backpack.

So I waited in darkness, holding my breath, wondering whether it was something she had seen, her elf luck pingin, or just a joke she was playing on me. Life-or-death jokes didn’t seem like her kind of thing though. I could get out at any time, but since I didn’t know what was going on in the outside, it was better to stay in for as long as possible.
I shaped the Anyblade into a longsword and grabbed Ropey out from the messenger bag, trying to make my movements as slow and economical as possible. Ropey curled around me, with one end trailing down each arm to provide either combat or climbing support. I touched my off-hand to one of the bones in my bandolier, again using languid movements, readying myself to drain SPD from it for the increased reaction time as soon as I was out. I used blood magic to give myself some light, mostly so my eyes wouldn’t adjust to the dark, and then I waited, still holding my breath and trying to fight down the panicked feeling of needing to take a breath.

I came out into an alley, burning the bone for speed as hard as I could and whipping back and forth to get my bearings while I took deep, gasping breaths that left me lightheaded. It was just Fenn, who had backed away from me. She was wearing a hat that covered her ears. There were people walking by on the street, but they gave us only the occasional interested glance before moving on, and not even that as soon as the Anyblade shrank down and back into a bladed ring.

“I saw a guy I assume was Larkspur,” Fenn explained. “My sense of luck pinged first, that’s why I put you in the glove, and I spotted him just after, quite far away. Tallish guy, red armor, sword, shield, cloak, short red hair, serious look just like our Mary, and three other people with him, similarly looking like they were about to start something.”

“They didn’t see you?” I asked.

“Nope,” said Fenn. “Unless they were clever enough not to show it, and had some reason not to try to snatch me. But no, they went into the building we were headed for, the Medicinal Magic store I was hoping to unload the alicorn at.”

“Okay, do you have a disguise for me?” I asked.

Fenn gave me a disappointed look. “You think I wouldn’t?” She held out Sable and produced a wide-brimmed hat with a black veil. “This is mourning garb for the altek,” she said. “Just pretend to be sad under there.”

I put the hat on, which made it difficult to see but would hopefully obscure my face. With a whisper I told Ropey to head back into the bag, because he was also distinctive. I stripped off both bandoliers and put them into the bag as well, then handed the bag to Fenn, who quickly disappeared it into her glove. That left the Anyblade ring as distinctive, and I quickly switched which hand it was on, changing its shape and color as I did so.

“Okay,” I said. “We’ll follow the plan, hire someone to send a message to the hotel for the others, then move around and hide out while we wait to regroup.”

“Or,” said Fenn, “Or, we know where they are, and if Larkspur ever saw me, it was in a black and white photo in a dossier, and you’re covered up, so I’m thinking that it wouldn’t be hard to sneak up on him close enough to at least eavesdrop. We know that they’ve got some way to track us, for certain now that I’ve seen them, but we don’t know exactly what that method is, and I would rather figure that out than spend the rest of our natural lives running.”

“Sounds dangerous,” I said. “Especially if we’re at only partial strength.”

“Well then I’m glad I didn’t go with my first suggestion, which was that I could snipe him, then hop into the glove and have you make a run for it,” said Fenn with a grin.

“Was there a big guy in full plate?” I asked. “Because he’s soul-linked, you’d kill him instead of Larkspur.”
“Still probably worth it,” said Fenn. “But this is a good opportunity for the eavesdrop plan, and maybe the only one we get, because we can’t guarantee when we’re going to see these guys again, or whether we’ll have cover from them.”

I hesitated. Killing Larkspur was one of my quests, and maybe this wasn’t on the docket, but it was an objective that seemed easy, and enough to get me within spitting distance of the level up, if I wasn’t already.

“Alright,” I said. “We’ll do it. No offensive action.” Though I was waffling on that, and wanted to add some qualifiers, like ‘unless we can kill Larkspur and then get away’. I halfway thought that was just my desire to level up talking though. (I shoved down some half-panicked thoughts about whether or not I was addicted to leveling up for later examination, but that was a worrying prospect if true.)

I checked her over to make sure that the hat was properly hiding her ears, then we moved out of the alley and toward the store, Medicinal Magic. There was no one stationed outside, which I took to be a good sign. We went as close as the entrance, on the side of the door without a window, then started a casual conversation in quiet tones that neither of us was paying any attention to (Fenn was talking about a book she’d read and I was saying ‘uh huh’ at regular intervals).

“-- short-term losses for long-term gains,” Larkspur was saying. “But given those long-term gains, and the long-term losses we might suffer if the target isn’t recovered, I do think it prudent to continue on this course for as long as feasible.”

“That’s what I’m saying,” came a female voice, one I didn’t recognize. “At this juncture, it’s no longer feasible. You’re taking time away from your duties as FSD and spending money as though it were a resource we weren’t constrained on. This is starting to look like the sunk cost fallacy in action.”

“She has the entad,” replied Larkspur.

“She might. It seems that way given the distances involved. And what good does the recovery of it do you?” asked the female voice, with a touch of exasperation. “It’s a political coup, but one that you can’t capitalize on, because it would raise too many questions about what happened to her, not to mention how you found her. We’ve spent too much political capital and reputation on this already, more than we wanted or agreed on at the outset.”

Larkspur gave a soft growl. “Eight days before the councils are back in session,” he said. “We have until then, at least.”

“You do,” the woman replied. “I’m going home. Good luck on your second time in the EZ.”

“I’ll need you there,” said Larkspur. “If Doris --”

“I know,” said the woman. “And that’s your burden to bear.”

Fenn pulled me along, back the way we came, just a few seconds before a woman swept out of the shop, dressed from collar to toe in a frilly red dress. The veil offered me some leeway in looking at her, and I could immediately see the family resemblance to both Amaryllis and Larkspur, both the red hair and pretty features, but also the seriousness of her expression. She wore a circlet on her head with several gemstones of different colors, all set in a line. She didn’t give a second glance at us, for which I was grateful.

As soon as she had gone off through the crowds, we stopped again to speak casually, me with my
back to the store and her with her eyes peeled to it.

“I think that was enough,” Fenn said in a low voice. “We should take off.”

“No,” I replied. “We still don’t know how they found us. My guess is that they have precognition of some kind, but we need to know the details, whether it’s probability based or has some kind of limits that we can work around.”

“Fine by me,” said Fenn with a shrug. “They’re leaving.” She moved forward, at a casual, steady pace, and I followed after.

Larkspur was in his familiar red armor with black at the seams. Beside him were the two others I had seen at the library, the massive man in full plate who was meant to take the hits, and the horned woman with a staff (not, as yet, spinning and glowing). We kept our distance, far enough back that we couldn’t have heard what they were saying, if they had been talking. It didn’t look like they were though.

“What’s the plan?” I asked.

“I could shoot the meatshield in the head or chest,” said Fenn, leaning close to me. “My bow can puncture plate fairly easily. But then again, I’d assume that’s magic plate, and without knowing what kind of magic plate, it’s hard to say how wise shooting him would be.” She paused. “Probably not a great time for an artillery shot, given all the people around.”

I’d been thinking the same thing, and I was relieved to hear her say it. Her casual disregard for others when stealing had worried me a little bit. This was plausibly a time for the sand bow; all we’d have to do is wait for them to stop moving, she could line up a shot, and then we could hoof it while the arrow was still suspended in time.

“They went to that store because they thought we would be there,” I said. “We would have been there if your luck sense hadn’t twigged. So where are they going now? And why?” We’d only spent a few minutes, at most, getting to them; what information were they working on, that they would just leave the shop in relatively short order, rather than waiting in ambush for us to arrive?

We followed them for several blocks, with every intersection seeming to have been given a new angle at random, until we were into the true heart of the city, where there were buildings twenty or thirty stories tall towering over us. Larkspur stopped once or twice to consult something I couldn’t see, and those moments were always tense, because I worried that his goons would look around, or that he was using the magic item that was tracking us and would spin around to catch us. Those things didn’t happen though; that was the thing about paranoia, most of the time you were preparing for things that never ended up occurring.

Larkspur was bleeding information with every step he took, so far as I was concerned. I didn’t have the full picture yet, but I had enough to start making some guesses. The conversation we’d overhead meant that the Larkspur problem was likely to solve itself, at least insofar as he was actively hunting for and attempting to kill us. There were still travel restrictions and warrants to look out for, but true border control seemed like a game that the cities and nations of Aerb had long since given up on, at least if magic was in play. He really was burning non-negligible resources to find us, and this current plan couldn’t last. We knew that his divination (or whatever) was highly imperfect, and my guess from the way he treated the medicine shop was that he had a lot of false positives.

“This is boring,” Fenn whispered to me after about twenty minutes. I shot her a look of disapproval. “What, it is, you can’t tell me that it’s not.”
“It’s important,” I said, though she was right, the tension had nearly evaporated, and now it was just drudgery. They weren’t leading us into a trap, they weren’t on the lookout for anyone following them, and if any of them had been trained to spot a tail, they sure weren’t showing any sign of it. Fenn, for her part, occasionally popped us down a side street for a quick costume change, which was easily accomplished given that she had apparently stolen an entire frickin’ clothing department. (She looked adorable in glasses.)

We did catch occasional snippets of conversation, though we were too far to make out much. The multi-syllable words were actually a little easier to catch, because I could infer missing sounds: “probabilistic”, “triangulation”, “candidates”, “duration”. It was frustrating not to be able to get a clear sense of what they were actually talking about. All I really wanted was for someone to say, “as you know” and then describe in exacting detail what they were actually doing, was that too much to ask? I did get a few glimpses of the thing he was consulting; it looked something like a pocket watch.

“Shit,” said Fenn, as Larkspur looked down for another consultation, something he was doing more frequently. “Luck is twinging, we should … oh fuck.”

I saw it too; our travels through the city on the trail of the Prince had brought us to a place with restaurants, and coming out of one of them was a red-headed girl in a pink ‘Princess!’ shirt, followed by a green-skinned woman with a cloak of leaves and a long staff. Amaryllis and Solace seemed to be in high spirits and were talking animatedly with heads bent together, and I could see that it was only going to be a matter of time before Larkspur or one of his people saw them.

There were too many people around for a fight, and we were under-strength given that neither Amaryllis nor I were wearing armor. There were two cars and a flatbed truck loaded with barrels making their way down the street, moving slowly because of the people that seemed heedless of jaywalking laws (if this place even had any). A full battle here would be a shitshow, especially if we were at it for long enough that the local equivalent of the police showed up.

“Give me the bag, take the shot,” I said to Fenn after only a few seconds of deliberation, hoping that we could end this quickly.

My messenger bag popped out of her glove and she tossed it over, then the bow appeared in her hand, and an arrow after that in short order. I slipped on my bandoliers while this was going on and Ropey slithered over my body to provide protection and support. The Anyblade was expanding to a full, heavy greatsword as Fenn loosed her arrow, which zipped across the hundred feet of distance with a twang of her bow.

The arrow struck the armored man almost precisely in the center of his chest, puncturing all the way through, and I heard a grunt from Fenn beside me. She was bleeding from her chest, in the exact same spot, and staggered slightly before spitting up blood and materializing a dead fairy in her hand. She pitched backward slightly and caught herself only by resting her weight against the bow, then stuffed the fairy in her mouth.

I wanted to stay with her and heal her with bone magic, but the horned woman was spinning her staff, setting it glowing, and Larkspur was running to close the distance, which meant that I really didn’t have that option.

I pulled my throwing dagger from my satchel and threw it at him as I moved. He slowed down slightly and put his shield in front of him; the convex metallic surface shimmered and then disappeared, showing a left-right flipped version of the street. My dagger sailed through it and came right back out, having (apparently) passed itself. It landed right back in my hand, painfully hard, having accomplished almost nothing.
Skill increased: Thrown Weapons lvl 17!

Then Larkspur and I had closed the distance between us, him because he wanted to kill me, and me because I wanted to keep him from killing Fenn. The first screams of alarm had started up from the people on the street as we clashed, my greatsword against his longsword.

I shifted the Anyblade down after the first clash of swords into something thinner and lighter, more maneuverable. He had armor, a shield, and was soul-linked to a meatshield who was surprisingly still on his feet, which meant that I was immediately on the defensive. I was actually a pretty legitimately good sword-fighter at this point, but Larkspur went at me like he had been training from the day he’d been able to hold a sword, which probably wasn’t far from the truth. I was able to parry against him, knocking his sword off the line of attack and occasionally taking a hit on the flat rather than the edge (still painful, but not limb-loffing), but I was doing basically nothing against him, only retreating step by step. Past him, I could see the horned woman spinning her staff, which was glowing brighter all the time and nearly at the point where it was nothing more than a glowing circle, at which point I knew it was going to be a force to be reckoned with.

I grabbed at a bone in my bandolier and drained it of SPD in an instant. I saw the opening that would let me get a strike in, but with the two transference effects going on (from him to the meatshield and from the meatshield to me, if it worked like that) I wasn’t going to risk it. Instead, I used the moment of clarity to knock his sword to the side and yell for Ropey to sic him. My favorite-ever sentient rope was already waiting, loosely gripping my sword arm, and shot forward to wrap around Larkspur’s wrist.

From there it was, at the very least, no longer a losing battle, because his mobility was so restricted that he couldn’t properly swing his sword. He was left trying to shield bash me, which was partially effective, but we were at a stalemate.

I was feeling the adrenaline rush hard, that frantic energy that came with life-and-death. My heart was thumping hard and I pushed Larkspur back with a rush of blood magic, yanking his arm again and nearly sending his sword flying. I heard the twang of Fenn’s bow again, then again, with screams of pain from her. An occasional burst of automatic gunfire came from the other end of the street, and in the background I saw the twirling staff falter and then stop altogether as vines grew up from the cracks in the street and grabbed her by the feet. I had no idea where Amaryllis was, but it seemed like if I could hold Larkspur just a little bit longer his minions would be dealt with, and then all Fenn would need to do was put an arrow through his eye.

He must have realized that, because he dropped his shield and moved in toward me, quick and unexpected. He brought his left hand up and his sword vanished from his captured right hand to appear in his left. I tried to step back or get up my guard but wasn’t quite fast enough, or skilled enough, and the sword came down hard on my shoulder, slicing halfway through the joint. I screamed in pain and fell backward, dropping the Anyblade in the process. Larkspur yanked his right hand, still connecting us by rope, and pulled hard at my partially severed arm, tearing flesh, skin, and ligaments in a moment so blindingly terrifying and painful that I blacked out for a second.

When I came to, what must have been a fraction of a second later, my arm was dangling by a half-inch of muscle and a thin layer of skin, twisting around when I moved and so incredibly agonizing that all I could do was scream. I was vaguely aware of Fenn stepping over me with a sword held inexpertly in her hand, and a blur of pink shirt and red hair moving to protect me, but I was screaming and crying, bleeding all over the place.

Leroy Castillo defeated!
I don’t know how long I was down on the ground, but eventually I felt myself falling, whipping through the wind, then a warm glow at my shoulder which erased the pain, and after that, a bird’s beak tapping on my head sent me straight to sleep.
I woke up gasping for air and looking around wildly. My brain must have been working off some really old subsystems, because my first thought was, *this isn’t my room*, before I remembered that I didn’t have a room anymore. I was on Aerb, not Earth, and on Aerb I was an itinerant wanderer without a home to call my own.

I looked down at my shoulder, fearing the worst, but saw that it was intact, connecting my arm to my torso like it had been doing for more than seventeen years, until very recently. There was a deep red seam there, but it was only on the level of the skin, not in the flesh itself, and my mobility as I gingerly moved it was only slightly limited.

I wasn’t in the hotel; I was in the house built into a tree, inside the bottle, which was presumably inside Solace’s cloak. It was dark, but the remains of a small fire smoldered away in a little blackened recess of the tree. I got up out of the pile of furs that had been serving as my bed and went over to it to warm my hands. There was a chill in the air; I had to guess that the bottle didn’t get sunlight while in the cloak, which meant that there was no outside heat or warmth getting in, ignoring for a moment that the sunlight hitting the bottle would never have possibly been able to heat a square mile of forest and grassland. I called on the heat of my blood to give me a hand of flame, which lit my surroundings a little better.

I tried to take stock of my situation, and my mind kept going back to one thing.

*One of them dead, probably the meatshield, and still no level.*

It was hard to set that aside. The next level *had* to be close, you could slow progression as the player gained levels but you couldn’t stop it altogether, that flew in the face of too many principles of game design. It had been so close I could taste it, one kill *should* have been enough. That thought of *addiction* was still lingering, but I didn’t know what that actually felt like from the inside. Formally, addiction wasn’t just the need for something, it was the compulsion and interference with your life. Leveling up was pleasurable, last time almost achingly so, but I wasn’t sure whether my actions were being influenced by the desire to feel that again, especially since leveling up was the single most important thing I could do for other reasons as well. But maybe self-deception was part of addiction, this idea that you could stop anytime you wanted, or the production of motivated reasoning to excuse what you had done.

My messenger bag was with me, though the strap had been cut through. Ropey lay inside it, and he uncoiled at my touch, then slithered his way to the fireplace. I watched closely as he started making the shapes of letters.

S-O-R-R-Y

“It’s okay,” I replied. “You were doing your best.” He’d been turned into a weapon against me, just momentarily, when Larkspur nearly yanked my arm off. “You saved my life.” I reached out and patted him on the head, and he snaked his way back into the bag. Yup, that was me, providing comfort to a piece of rope.

I was almost entirely naked, aside from my boxers, but I had clothes sitting in a pile on the ground. Just looking at them was enough to tell me that I wasn’t going to put them back on; they were crusted with blood from the fight, which I guess is what happens when you nearly sever an arm. The clothes didn’t really bother me, since it was all stuff that Fenn had picked out, and didn’t really fit well to begin with. When we had some downtime, whenever that would be, I would go shopping on
my own and find some things that I actually wanted to wear, then buy them in bulk.

I yelped in surprise when the Six-Eyed Doe stuck its head through a window and stared at me, but I recovered quickly and tried my best to look dignified. It was luminescent, making its own pale blue-white light that contrasted with the orange of the embers and the yellow of my flaming hand.

“Thanks for your help,” I said to the doe.

It nodded fractionally.

Well, at least it could understand me somewhat, that was something. I rotated my shoulder, trying to get a little bit more mobility back. The doe kept staring at me. I reached into my bag, frowning at the blood on the strap, and pulled out the bandoliers inside it, first grabbing a fairy and eating it, and then pulling out my selection of bones.

“Is Solace here?” I asked the doe.

It didn’t move or reply, which I gathered meant that it either didn’t understand the question, or the answer was no. As I munched on the fairy until it was a wet wad of marzipan, I tried to think about what must have happened. My memories of the final moments ranged from hazy to entirely absent. Solace must have grabbed me and pulled me into her bottle with her in order to gain access to better healing power. She’d clearly been the one to save my arm, and she must also have been the one to put me out. After I swallowed the fairy, my shoulder began to feel better almost immediately, and I briefly wondered why Solace hadn’t fed me one to work in conjunction with her healing magic, before realizing that we’d never told her what they did.

So now I was stuck in the bottle until someone came to rescue me, with just a sentient length of rope and a probably-sentient magical doe for company. Ropey was fine, but the Six-Eyed Doe weirded me out, not least because it kept its head stuck through the window, staring at me.

I touched one of the unicorn bones, then glanced at the Six-Eyed Doe. “We killed a unicorn,” I said. “I hope that doesn’t bother you,” I said. “And I hope that it’s okay to be using some other kind of magic in here, but I think it’s probably fine, right?”

The only response I got was a small dip of its head.

I breathed out a sigh and looked down at the unicorn bone, an aitch bone. I gripped it lightly in my hand, allowed my flame to wink out, and closed my eyes. I was looking for a way to draw out the unicorn magic, because even a single use of its power would be enough to win a fight, if used at the right time. If I could use that power to rapidly gain skill increases, all the better.

PHY, POW, SPD, and END were all there, ready and waiting for me, but there were other things within the bones, which to my mind felt like magical strata, layered there and waiting. The existing attributes all had a specific feel to them, one that I didn’t even consciously think about when I pulled on them. All I had to do was identify that feeling in the bone, or something that approximated it, and I would be able to isolate the specific piece of bone magic I wanted to pull. I could feel others in there now, where I couldn’t before.

Spell discovered: Mental Tapping!

I learned the technique without actually using it, which was a relief, because the unicorn bones were precious. I could feel it there though, the mind of the unicorn, or at least the hint of its mind, or maybe just the echo of its soul. I prodded at the magic, making sure not to pull at it. Like PHY, it
was divided up into three parts, though those three didn’t encompass everything -- was that a hint at the nature of the attributes, that the superstats were somehow more than just their components? Yet I didn’t know exactly what that part, left behind, would entail, not for PHY and not for MEN. Still, teasing apart the lump of magic was something I could do without actually pulling on it, and I already knew their natures.

*Spell discovered: Cunning Tapping!*

*Spell discovered: Knowledge Tapping!*

*Spell discovered: Wisdom Tapping!*

I was a bit pleased with myself at that, but I was no closer to touching the unicorn magic. There were other things in the bone, things that I thought I might be able to pull on later, but after a half hour of trying, I gave that up for lost. I was skill capped on Bone Magic, and my guess was that a 21 meant something equivalent to a graduate degree; I was more skilled with bones than someone like Bormann, who’d trained for five years at the athenaeum, but I wasn’t at the upper echelons just yet. And more to the point, I wasn’t going to get any better unless I raised my level, which I didn’t have any way to do.

No one had come for me. In the worst case scenario … well, maybe the bottle was in Solace’s cloak, and she was dead, which meant that the only way I could get out would maybe be to scale the walls. That would be difficult, seeing as it was a mile and a half climb up a glass surface without any equipment, and depending on how the extradimensional space worked, that might just leave me floating next to the bottle, still unable to leave. The other option would be to become a druid, but Solace had said that would be impossible, and anyway, I would probably never be able to leave because I would keep questioning the nature of any magic that might let me escape, thereby rendering it unusable.

Panic didn’t really do much good though, so I turned my attention toward self-improvement instead (and I’ll be honest, if I had a computer with internet access, I probably would have wasted my time on reddit, because that was what I had done with countless chances at self-improvement on Earth). The problem was, I had almost nothing in the way of resources, and I was capped on most of the skills I cared about. Engineering was the only one I really wanted to level, and I was in circumstances almost uniquely unsuited for that.

That left only one avenue of real progress, and it still had its stupid head sticking through the window, staring at me with six eyes. Six-Eyed Doe, Loyalty 0, that was a metric that I was in the right circumstances to improve.

I walked out from the tree without putting my tattered clothes back on, out into the grass, feeling it on my bare feet. It was cool, but not enough for me to quite feel a chill, because there was no breeze moving the grass around me. The Six-Eyed Doe came over to me, stopping six feet away with its head lowered to my level, staring at me.

“Hi,” I said.

That got no response.

“I don’t actually know how you’re supposed to interact with a locus,” I said. “Maybe you’re not supposed to know, and knowing would destroy that interaction. Maybe it’s like the Heisenberg uncertainty principle, where you can either know the exact speed or the exact position of an object, but not both. So I could understand, concretely, how to talk with you, and be unable to actually do it, or I could be able to talk with you but be unable to understand how I was doing it.” I hesitated. “I’m
from another world, one called Earth, that’s where Heisenberg is from, but my guess is that on Aerb he’s a gnome, or the name of an institution or village somewhere.“

The Six-Eyed Doe kept looking at me.

“Look, I’m not going to pour my heart out to you, because I keep worrying that you actually can talk, or you’re more intelligent than you look, no offense, and my read on what I’ve seen of Aerb so far is that I’d get done telling you a long story about something embarrassing, and you would respond by speaking directly to me, just as the world’s way of throwing me off-guard, so I’m not going to do that,” I said.

There was still no response, save for the doe blinking, which it did in sequence, one eye at a time.

“Okay,” I said. “I guess you should know that the two of us are linked together in a way that I don’t fully understand yet. I think that, at least, is something that shouldn’t be hidden away, because it concerns you, and you didn’t have any say in the matter. I don’t want to say that’s my policy for companions, because I don’t think you’re the kind of … thing? The kind of entity that would like being subject to a policy, but maybe I can just say that I chose to tell Amaryllis, Fenn, and Grak, and I think I’ll keep coming up with the same answer for companions in the future. Besides, it’s logistically easier if everyone is in the know.”

The doe bowed its head slightly, and seemed to be looking at my navel for a moment before returning its attention to my face. I couldn’t help but think about Clever Hans, though that was uncharitable.

“Did you know Arthur?” I asked. “He went by Uther Penndraig.” I continued on, not waiting for a response because I knew it wasn’t coming. “You’re the first person, or entity, whatever, that I’ve met who might have actually met him, or at least seen him once, because you’re old enough for it. I like to imagine that he came into your forest at some point and understood you on a level that I clearly don’t. He was always more about that sense of majesty and wonder.”

I paused. I’d kind of given up on actually budging the Six-Eyed Doe’s loyalty. Fenn had gained loyalty just from the things that I had said to her, but that hadn’t actually been intentional on my part, and at least insofar as the ‘I don’t really care one way or another whether you’re a half-elf’ stuff went, part of what must have made that effective was that she knew I was speaking without inhibitions and that I had come at it from an awkward angle that made her actually believe it. I had no idea what would gain the loyalty of the Six-Eyed Doe aside from telling it that I was going to restore it to a proper domain, which I had already done.

So I sat in the grassy field, with the luminescent doe the only source of light, and thought about where the two of us might intersect, what it might eventually come to see in me, if we could ever become something like friends.

“I think that sense of wonder people feel is just a more mild form of surprise,” I said. “How the brain works --” I hesitated, because that wasn’t a thing the doe would probably like to hear, but then barrelled on ahead, because I didn’t know another way to say it, “The reason children have this sense of wonder isn’t that they’re innocent, it’s that their brain hasn’t come to terms with everything there is in the world. They see, I don’t know, a tree, and their brain is processing the fact that this tree has branches that go off in different directions and subdivide into smaller branches that sprout leaves, and those leaves have similar but distinct shapes, so the kid’s brain is trying to build up this model of what a tree is, and that’s why he’s looking at it with wonder, and why he can think that a tree is majestic. But adults, or even teenagers, already understand trees, so when their eyes see a tree, their brain says, ‘oh yeah, that’s a tree’, and it never even really enters their minds. Maybe that is what we mean by innocence sometimes, maybe it’s not always about corruption or being jaded, but just about
a lack of knowledge and how brains deal with that.”

I reached down and touched a single blade of grass, bending it back slightly. The doe was still staring at me, as it had been the whole time, but I was starting to get used to it. I smiled a little bit as I thought about losing my sense of wonder at the fact there was a giant glowing white doe with six eyes staring at me.

“I used to make an effort to induce that sense of wonder in myself,” I said. “I would look at a blade of grass, like this one, and just try to turn off that part of my brain that was categorizing it as a blade of grass, and then turn off all the sub-categorizations, to dump that hard-earned childhood knowledge overboard for a bit and see it as I had first seen it, when I hadn’t known what it was. Sometimes it worked and I could have this moment of relearning, of seeing without knowing.” I tried it then, with the blade of grass I was touching. It was meditation, in a sense, but in another sense it was the real mental effort of clearing every single cache away and digging deep for a mental mapping process that didn’t get used all that often anymore. Psychedelics probably would have helped.

Eventually I did get it, just for a moment, this sense of awe and realization as my brain was tricked into discovering grass all over again.

*Loyalty Increased: Six-Eyed Doe lvl 3!*

The doe moved forward and gave me a slow, lazy lick on the face.

“Thanks,” I said, as I tried to wipe the deer spit away. I tried my best to not think my thoughts and just feel a sense of majesty. When that didn’t work I tried to think in parentheticals as though that wasn’t what I was actually thinking about (only a sidenote, honest), but I had no idea how successful I was.

(Could the locus read minds? Was that the implication of the sudden loyalty jump? Or could it read them only in a coarse way, so as to sense that moment of wonder? Was it the moment of awe and majesty at something within the doe’s domain what I was being rewarded for, or was it the effort I had put into having that perspective, regardless of where it happened? Had the Six-Eyed Doe’s loyalty been at 0 before that, or had it risen while I was unconscious? And if I had gone to the effort of getting a proper baseline before I’d gone out to speak with the doe, would that undercut the work that I had done here, because the doe would sense that I was trying to game the system?)

So I sat in the grass for a bit more, trying unsuccessfully to recapture some of that ... I hesitate to call it magic, but calling it a circumvention of my brain’s predictive modeling functions seemed far too sterile, especially given my (debatably) psychic companion.

It wasn’t too long before there was light, and after so long with only the doe-glow, it was almost blinding. It was hard to see what was going on outside the bottle, due to the curvature, the imperfections of the glass, and a fuzziness I assumed had something to do with how light behaved at the border. There were people though, and I could see their general features; a tall, slender one with blonde hair that was likely Fenn, an unidentified shorter person, a very short woman with green skin that had to be Solace, and the familiar squat, hairy form of Grak.

One of the people-shapes, the one with green skin, vanished, and an enormous hawk came soaring down out of the sky not long after. It pulled up sharply as it neared the ground, and with a burst of feathers transformed into Solace, who strode out from the feathers as though this was completely normal.

“You’re awake!” she said with a wide smile as she approached me.
“Yeah,” I said. “How long was I out?”

“I have no idea, how long have you been up?” she asked. “I put you in the bottle some twelve hours ago.”

“I slept ten of it,” I said. “I don’t think I actually needed that much sleep though, once my shoulder was halfway healed -- we have these marzipan fairies we pull from a magic jar that heal wounds, up to and including broken bones. Your healing, combined with those, would have had me on my feet much faster.”

“I know that now,” said Solace with a nod. “At the time, I thought that I was doing you a favor by acting quickly and decisively, and once I learned otherwise, I had put you into too deep a slumber to safely rouse you from. It didn’t matter much. The fight was already over when I put you in the bottle and we’ve been in hiding ever since.”

“What was the outcome of the fight?” I asked.

“The soul-linked warrior was killed,” said Solace. “Larkspur escaped, despite Fenn’s best efforts to shoot him in the back as he fled. There was a woman with him, but she escaped as well, though in another direction. On our side, yours was the worst injury.”

“Fenn and Amaryllis are okay?” I asked.

“Fenn took a total of five arrows to the torso and two to the legs,” said Solace. “The soul-linked warrior was wearing some manner of armor that returned the damage dealt to him back to her, which was a price she was willing to pay so long as she had fairies to eat. Amaryllis was shot three times in the stomach and twice in the arm, but I managed to keep her on her feet, and after we used the teleportation key to leave, she healed the rest with fairies. I believe those are now in short supply, given how freely they’ve been consumed.”

I was wincing through most of that report, but being low on magical fairies was the really serious problem, given how much we’d been relying on them. I wished that I hadn’t eaten one while we were in the tree and used a bone instead.

“Grak?” I asked.

“He’s only recently returned to the fold,” said Solace with a small gesture towards where I assumed Grak was, in the outside world. “He came back to the hotel and got our message there.”

“Okay,” I nodded. I looked to the walls of the glass bottle and the world outside it. “And where are we?”

“Per Amaryllis’ instructions, we’re picking a new location at random every hour,” said Solace. “She believes that she knows which particular method Larkspur was using to track us, given what you and Fenn learned.” She grinned. “She’s quite irate.”

“And we have a tree to exit to?” I asked. “I’m eager to see the others.” I looked down at my nearly naked body. “Fenn has all my clothes.”

“We’ll take another way out,” said Solace. She stepped forward with her staff raised and stopped for a moment. “Do you have anything against mice?”

“Uh,” I said, thinking about the dozens our cat had brought to the back porch over the course of the years, and how it had become my responsibility to dispose of the corpses because he was ‘my cat’. “No? Let me get my things first.”
When I came out from the tree, slightly bloody bandoliers and bag around me and sneakers on my feet (a horrible look), she bopped me on the nose and with no transition whatsoever I was clinging to the head of her staff with all four of my paws. Even trying to play back the memories I couldn’t sense where the seam was, between being a human and being a mouse. There wasn’t even a discontinuity (and yes, I did feel a sense of awe at that, but in the biblical sense, the kind of awe that gets used as the root in the word ‘awful’).

With my small mouse eyes, I watched as Solace grew a pair of mighty, leathery wings from her back, gently pushing her leaf-cloak to the side, and with no apparent regard for the mouse on the end of her staff, she launched herself into the air. I tumbled off, naturally, but was caught in her fist, and suffered through the stomach-lurching sensation of rapid, rising flight, trying not to give in to my natural urge to claw and bite at her.

It wasn’t long before we were out, and I was tossed into the air, feeling myself twisting and falling before somehow, miraculously, finding myself in human form, standing on my feet with my companions around me.
“He made a deal with fucking Doris Finch,” said Amaryllis, as soon as I was out of the bottle.

I stared at her; her hair was different, cut short, almost to the scalp, and no longer the red it had been, but brown instead. She was in her full armor, minus the helmet, and it gave her a look that was boyish (but like an extremely attractive boy, enough that it started to awaken confusing feelings in me).

“The shirt says ‘Incognito,’” said Fenn. “But you can’t see it, because someone is a spoilsport.”

“I’m staying armored until he’s dead,” said Amaryllis. She didn’t seem to be in the mood for humor. “We all are,” she nodded to Fenn.

Fenn was wearing her own leather armor, I noticed, and she held out her hand to me. I caught the things she threw to me one by one, first a plain white shirt, then the tights I wore to keep my armor from chafing, then the armor itself. I put those on as quickly as I could.

“The city guard is after us,” said Amaryllis as I dressed. “Not surprising, given the general mayhem. I don’t know what the long-term consequences might be, but ‘not good’ would be a fair place to start. Larkspur might have sold them a story, or got away before it could be linked to him, or maybe he just decided to cut his losses and run, but I know which scenario is worse for us, and that’s the one we have to assume.”

“And we can’t just leave?” I asked. “Teleport out?”

“Yes, we can,” said Amaryllis. She fidgeted slightly. “I’m not worried about the city guard that much, not when we have ready access to disguises and they have poor intel on us, even if Larkspur is the one informing them. We can use the bottle as a way to change up our numbers at will, which means that they’re looking for four or five people when we can stuff everyone into extradimensional space to hide our numbers. I’m not even worried about Larkspur, given that we know what he’s doing and can keep evading Doris. Nothing has changed, except the depths to which he’s sunk.”

“Sorry, who is Doris?” I asked.

“An enpersoned exclusion zone, apparently,” said Fenn. “One of those we’re going to murder.”

_Quest Accepted: Murder in Duplicate - As soon as it was discovered by a precocious young girl, the ability for a person to duplicate themselves was excluded to a thousand square miles and that single person. Doris Finch lives her life in duplicate; to complete the exclusion, it will be necessary to kill every single one of her. (0/9,513,912)_

“Okay, got a quest for that,” I said with a wince. I wondered whether that would count toward the Hitler achievement for killing six million people. “And I would assume that dealing with her is about as ill-advised as dealing with any of the other horrors?” (I didn’t say, ‘But isn’t she just a normal person, aside from the fact that there are nine and a half million of her?’ because I wasn’t an unimaginative idiot.)

“Yes,” said Amaryllis. “Not just because she constantly stabs people in the back, not just because the Republic of Doris Finch is congenitally unstable, but because it’s one of those things that the functional core of the Empire of Common Cause has the means and motive to deal with. The bans against working with her aren’t one of those idiotic things that atrophy the rule of law because
member nations put them down on paper and then never look twice at them. If we could prove that he’d entered into an agreement with any of the Dorises, that would be enough to get him executed and have sanctions levied against Anglecynn to boot.”

“But we’re going to kill him instead,” said Fenn with a vicious grin. “His meatshield is gone, that means he’s approximately one arrow away from death, and you had better believe that I’m on board with any plan that involves us gunning for him. I almost got hit by one of my own arrows. No one hits me with my own arrows.”

“And he’s tracking us with some kind of … probabilistic thing?” I asked.

“Doris is,” nodded Amaryllis. “I would guess that they have remote communication through an entad to enable it. And if that’s what’s happening, then he’s leaking highly classified information back to her, which again, any sensible government would lock him away for, if not kill him outright. We should be safe, so long as there’s not a high probability that we’re in any one specific location.”

I wanted to chide Amaryllis for not having told us about this before, but despite the fact that she didn’t like the name ‘encyclopedia girl’ I knew that there was an extreme amount of information locked away in her head, and I had decided that I was going to give her the benefit of the doubt when it came to things that she hadn’t thought were relevant. She had already given me the crash course on Aerb, and so far as I could see, exclusion zones weren’t likely to be relevant unless we were actually going near one (though perhaps this was evidence that I should have pressed for yet more infodumps, or prioritized reading through The Exclusionary Principle above my other reading and training).

“Okay,” I said. “So Larkspur has some way to see where we might be, or get a weighted map, or something like that? And the plan is that we use that to lure him somewhere and kill him?”

“Yes,” said Amaryllis.

I looked around at the faces, trying to see if there was anyone else who disagreed. Solace looked calm and impassive, as though the idea of cold-blooded murder didn’t faze her, which it probably didn’t, and Grak looked as impenetrably stone-faced as ever. They’d had time to talk about this without me. The vote had already happened in my absence, and even if it wasn’t unanimous, it had already been decided.

“He said that the new council session starts in eight days,” I said, “Or maybe seven now. It’s true that he might get us put on a list or whatever, but he might have already done that. He’s an ass, and he’s trying to kill us, but he’s at the end of his rope. What does killing him actually get us? A lower chance that we end up on the wrong lists? A nebulous possibility that it will be easier for Amaryllis to return to power? At most, seven days where we don’t have to be on the run from him? Revenge?”

“You have a quest for it,” said Fenn. “He’s a threat to us, and after that fight in the street, we’ve lost most of our incentive to be subtle. Besides that, you didn’t level, because I would have noticed, which means you’re close to it. Larkspur is going to push you over the edge. Besides, he’s a total dick.”

I glanced at Solace.

“I’ve been told about your power,” said Solace, giving me a small bow. “I requested few details, in case I need to interact with it in some emergency.”

“Right,” I said with a frown. So everyone was on the other side, and wanted to kill Larkspur at least partially because it would help me level. Was I correcting too far in the direction of not wanting to be
controlled by the desire to level up again? “Okay, then what’s the plan?”

“There are two things making our probability spread very wide right now in terms of location, and per the last intelligence reports I got, location was all that the Dorises could give for an entity,” said Amaryllis. She watched me. “This is one of those state secrets that I’m putting myself at risk by telling you, and you have to trust me that I would have done it before if I thought it was at all in play.”

I could feel the tension in the room rise a notch at that. The last thing I wanted was for the personal conflict between Amaryllis and I to spill out into the group. “I understand that,” I said. “It would have been better to know earlier rather than later, but I would have had to trust in your judgement in any case, and apparently he’s made a deal with the devil you thought he wouldn’t make.”

(How was she so attractive in brown, boyish hair? The only woman with hair like that I’d ever found attractive was Emma Watson, and while Emma Watson cutting her hair was an important moment in my young life, short hair wasn’t something that I’d ever thought I was attracted to. Was it just a blade-of-grass thing, where my brain had registered her as pretty enough times that it was starting to grow numb to the fact, and now I was faced with awe as the neural pathways tried to figure this new haircut out? Was my brain bringing her existing attractiveness to my attention over and over again because of the change?)

Amaryllis relaxed somewhat, losing some of the tension in her shoulders, and nodded. “The first factor is that we’ve randomized our movement through the city, which means that our probable location as seen by the Doris clones should cover a huge number of possibilities. The second factor is that we have a teleportation key we can use at any moment. That means that if something were to happen to us, we could simply leave, which is good for its own sake, but also spreads out our probable location even further.”

“What are the limits?” I asked.

“We don’t know,” said Amaryllis. “We don’t know how many entities can be tracked using this method, what’s needed to track them, or where these probabilities are actually derived from at a root level.” She sighed. “I really, really hate working on problems with such limited information. We don’t even know if Larkspur found you at the library using the strategic luck reserve or through this method, so we might not even have two examples to draw from.”

“We know that it’s imperfect,” I said. I rubbed at my left hand. “At a guess, highly imperfect. Larkspur went into a shop that we had been about to enter, and it must have been because Doris told him there was a good chance that we were in there already. Now obviously, we weren’t there. Doris wasn’t able to tell that we were trailing him, either. And given that he talked about triangulation, my guess is that they don’t actually have a map, they’re reading signals instead. If the probabilities displayed are affected by the probability reading, which I think they probably are, then it’s even worse.”

“All we need is to stay in one spot,” said Grak. “He will find us, and we will kill him.”

“Well, no,” I said. “He might not be able to see into the future, but he might still be able to see into alternate presents, ish, and if Doris can track him, then that means he can gather information about things that he never actually did.” I saw Amaryllis raise an eyebrow. “Stop me if someone has already brought this up.” Amaryllis shook her head. “Okay, so right now we’re moving around the city, picking our next location by way of dice or something, right?”

“A deck of cards,” said Amaryllis, “Keyed to a map of city blocks where we might reasonably hide, which, given the ability to transform into birds and land on rooftops, is most of them.”
“Okay,” I said. “So if we stopped moving entirely, and just stayed in this hotel room --”

“It’s a bedroom,” said Grak. “We looked at rooms for rent in the papers and snuck in. There are wards against sound, before you ask.”

“Huh,” I said, looking around. I guess we were fugitives from the law, after all. “Well if we just stayed here, and committed to staying here, then Larkspur would eventually find us, right?”

“Right,” said Amaryllis.

“And then we would kill him,” said Fenn. “Grak would set up all manner of wards, I would find some place to snipe from, and that’s before he even got to you, Amaryllis, and the last druid in the world.”

“More likely, he would send the city guard after us instead,” said Amaryllis. “And we would leave without ever seeing his face.”

“Well, what I was thinking is that he wouldn’t even have to do that,” I said. “If he can track himself, then he can flip a coin about whether or not to send the city guard. If the coin comes up heads, or er, circles, then he stays back and does nothing, or if it comes up torches, then he sends the city guard. And then, if he does send the city guard, he goes to one of three prearranged locations to indicate whether it was a success, failure, or neutral, or whatever bits of information he wants to transmit to his alternate present, where he’s tracking himself trying to figure out the plan.”

“Which means he still fails half the time,” said Amaryllis. She frowned. “Unless he sent them out after flipping torches twice in a row, and so on down that line of thinking, but that depends on how well Doris can see probability, which is unknown.”

“We could leave the city,” said Fenn. “That means he wouldn’t be able to leverage the city guard against us. We’re only staying here so we can use the teleportation key to leave at a moment’s notice, right? And so we don’t tip that we actually do have it, which Larkspur seems on the fence about? For all he knows, we scurried away from the fight just after he turned tail and ran.”

“We need to pick a killing field,” said Grak.

“Right,” I replied. “But it still has to be a killing field that he won’t know is a killing field, if he’s smart about things and only tries any given strategy half the time. I don’t want to continually set things up and have him be a no-show, only for him to screw off back to Anglecynn where he’ll keep causing problems. We already have to worry about his sister.”

“Hyacinth Prentiss,” said Amaryllis. “She’s his cousin-wife, not sister, they wed after his arranged marriage to me fell through. She was always more cautious, and you’re correct that she’s going to be a threat, though not nearly in the same way as him, especially not if we kill him. Killing him weakens her position immeasurably.”

That bit about an arranged marriage was news to me, but it probably wasn’t the time to dig into that, and I knew Amaryllis would say that even if I wanted to press the issue.

“Okay,” I said. “So we need to set up a trap that doesn’t look like a trap to his borrowed probability vision, which we don’t actually know the details of. And on top of that, the last twelve hours have presumably been spent moving around a lot and trying to maximize the spread of probability, which means that any deviation from that is going to draw his attention. Plus he and the Republic of Doris can both safely assume that we know something about the power and are taking active measures to avoid it, right?”
“I thought it was an acceptable trade-off,” said Amaryllis. “We’re safe from him so long as we keep on the move, and the only thing that moving is really costing us is sleep.” She yawned, and I could momentarily see the lack of sleep before her willful energy returned. “Granted, we can’t put that off forever, but we can sleep in shifts as we keep moving, if need be.”

“Okay,” I said. “I think I have a plan, unless there’s a concrete plan beyond luring him and killing him that no one has told me?” Amaryllis shook her head. “We can make twenty miles in an hour if we’re swallows. The land around Boastre Vino is largely uncultivated, and we can use the deck of cards to decide on a random angle away from here. We fly twenty miles using the random angle, then land there and prepare for Larkspur. From his perspective, it should look like we’re running away using some method of probability masking, right?”

“Probably,” said Amaryllis. I wondered if that was a joke, but she didn’t smile.

“We set a trap wherever we land,” said Grak with a nod of understanding. “That makes things more difficult for me.”

“Is this guy really dumb enough to go after us with just him and the devil girl?” asked Fenn.

“I would think you wouldn’t be one to talk about mixed parentage like that,” said Amaryllis with a frown. Fenn frowned back in a mocking reflection. “But to answer your question, I don’t know. I didn’t imagine that he would make a deal with Doris either, but it would appear he has. If I were him, I would cut my losses and run, but he’s already overcommitted this far. Men like the one we killed last night, trained, loyal men, are a valuable resource, one that he couldn’t possibly have tapped dry as yet, but one that he’d have to think carefully about. If he thinks he has us, he might bring in more, but … I don’t know for certain.”

“This doesn’t inspire confidence,” said Solace.

“I was thinking the same thing,” I replied.

“Juniper, I understand why you did it, and I even agree with it, based on what Fenn said, but the reality we’re facing down is that we had a full-on battle with Larkspur in the middle of a populated city street,” said Amaryllis. “I don’t know how he dealt with what happened at Bone and Flesh, but here, now, he has an opportunity to paint us as violent criminals. He could spin some story about being in Boastre Vino as part of his classified duties as FSD, collect eyewitness accounts, either legitimate or paid for, set up his brute as a martyr, and make the story as public as possible. It would bring scrutiny on him, possibly more than he could bear, but he could do it in order to fuck us. If we don’t offer up a target to him, and relatively soon, then the chance that he fucks us like that gets a lot higher.”

And if he continued his deal with Doris, whatever that was, it was entirely possible that we wouldn’t be able to stick around anywhere for longer than a day or so. That would mean that training at the athenaeums was flatly out for me, far into the foreseeable future. It would mean that we’d have to fly to any place that we hadn’t already been, and sneaking our way into the imperial teleportation network would almost certainly be a no-go. Hyacinth, his cousin-wife (blegh), would be her own issue, but she wasn’t loaded for bear against us, and I’d already seen her bow out of the chase as being not worth the effort. Larkspur was a danger to us because he was unpredictable, and if we let go of this chance and stuck to hiding, there was a really good possibility that he was going to crop up in the future. And if he did, then he was going to be in a better position.

Besides that, I was going to level up if we killed him.

“Fuck,” I said. “Okay.”
There were sixty cards in an Aerbian deck; the four suits were tines, flowers, cups, and bones, and the eight extra cards were four women (virgin, matron, whore, crone) and four men (fop, scholar, joker, brute). I had originally started dividing the arc in increments of fifty-two before getting a look at the deck and realizing that we were fortunate enough to be able to divide the entire half-circle of land cleanly by the number of cards.

After we’d talked it over some more, everyone disappeared into the bottle to get some rest, then Solace came back out again. A small light had gone on within the bottle, hovering just off-center and slowly rotating.

“Artificial sun?” I asked as she stowed the bottle in her cloak. I was out because I was well-rested and combat-capable, and she was out because she had to be. The lack of sleep didn’t seem to be affecting her.

“Something like that,” Solace agreed.

“I might have found that helpful,” I said with a shrug.

“Yes, you might have,” Solace nodded. “Did you speak with the locus?”

“A bit,” I admitted. “You gave me some time with her?” That wasn’t quite an accusation, but I had my suspicions. The timing seemed awfully convenient.

“Yes,” said Solace, inclining her head a fraction. “You call it a she?”

“I try not to,” I said. “But it is a doe, not a stag.”

Solace nodded. “Words don’t matter much. It’s only convention.”

I opened my mouth to launch into an argument about that, because of course words mattered, because of course convention mattered, but I held my tongue, because most people didn’t find arguments like that endearing, and Solace had four hundred years of being like this, which meant I was really unlikely to change her mind.

The plan was that the two of us would stay on watch for the next hour, then draw a random card from the deck to figure out what direction we were heading. Solace and I would fly for about an hour, then land at the nearest defensible spot, where she would pull everyone out of the bottle and I would guard against attack. In the meantime, everyone else would be getting at least a little rest. It would have been better to have everyone at full strength and fully rested, but we were worried that if we didn’t give him the opportunity soon, Larkspur would simply give up (if he hadn’t already).

The thought that this entire thing might be for nothing, that he might already be back in Anglecynn, was weighing on me. According to everything I knew about narrative logic, he would show up at the field of battle as soon as he saw the probability we were anywhere else narrowing down. Trying to understand the world of Aerb through the lens of narrative was a fool’s quest though, because the Dungeon Master knew where I was looking and what I was thinking, and if a player ever tried something on the theory that ‘that’s how it works in stories’ then it was your duty as DM to slap them down so hard they didn’t try garbage like that in the future.

And if he did go after us … well, what did he know about us, and what did that say about our odds of success? Amaryllis seemed confident that he didn’t know we had a druid, because everything that Solace had done was more easy to attribute to various unknown entads than to a druid that had been in hiding for hundreds of years (“think horses, not zebras”). If he had after-action reports of any kind from Barren Jewel, he might know that we were working with a warder, or at least had been, and the
same went for if it had been him at Weik Handum rather than people Aumann had sent out, or some unknown third party. He knew about and had seen Fenn, and he had a fairly good read on me, though perhaps he would assume I was out of the battle given the injury he’d given me.

From Larkspur’s perspective, he was looking at a group of four to five people with powerful magic items and rudimentary magic skills, one of them, maybe, a warder. I didn’t know whether he was the type to overestimate or underestimate, but my guess was that he would underestimate us, because that’s what he’d done with me at the library. His search method using probabilistic magic also seemed (to me) to be somewhat sloppy, or at least premised on the ability to resolve conflicts from a position of superiority. Unfortunately, it was possible that after underestimating us twice, he would wise up the third time, and even if he didn’t stop his habit of thinking he had the upper hand, he would still have to raise the assumed lower bound of our capabilities.

I was looking at too many unknowns. Donald Rumsfeld got flak for having said that there were known unknowns and unknown unknowns, but I had always thought that was an amazing insight into information and planning. We could, at least to some extent, plan against strategies and powers that Larkspur might have available to him, like if he brought in a gold mage, or a pustule mage, and we could alter what we did in accordance with the probabilities that we assigned to each possibility, mostly based on what Amaryllis knew about Larkspur. But we couldn’t possibly plan against the things we had no idea even existed.

That was what worried me. I thought there was a reasonable chance that Larkspur would use his probability triangulation method, however that worked, to see that we were leaving Boastre Vino, and from the spread I was hoping the deck of cards would give our probability, I hoped it would look like we were trying to make a getaway and then camping in the wilderness. Maybe he would come out to play … but if he did?

“What’s on your mind?” asked Solace.

“I don’t know what this battle is going to look like,” I said. “We’re hoping that our ability to wing it is better than their ability to wing it, or that our preparation outweighs their caution, and I just … I still don’t like it. There’s too much variability.”

“Yes,” nodded Solace. “The unknown can be difficult.”

“Yet that’s sort of your thing?” I asked. “Dealing with the unknown and winning despite not being able to probe deeper into it?”

Solace shrugged. “That’s one way to be a druid,” she said. “Things are easier, if you don’t know all the reasons that something can’t work, so some druids prefer -- preferred, sorry -- to simply take everything as it comes, working on instinct and intuition.”

“And … you’re not like that?” I asked.

“It’s fuzzy, being a druid,” said Solace. She sat on the bed, which had no sheets or pillows, and folded her hands. “But at a certain level, you need to win every single battle you fight, and instinct and intuition alone aren’t enough, not if you fight hundreds of battles. Ignorance is not the great druidic virtue, nor is faith.” She gave a small laugh, and touched her light green fingers to her dark green lips. “It’s funny, but I want so much for you to understand.”

“Oh?” I asked.

“You hate it,” said Solace. “You don’t understand druids and you don’t understand the locus, you have the mentality that spurred the Second Empire toward genocide, and yet … the Deep Searching
brought me right to you. I want to repay your willingness to help by giving you that thing you desire, such as I’m able. I want you to know.”

“Well, I don’t feel like I’m closer,” I said. “Unless you’re saying that the great druidic virtue can only be defined by negation.”

“They say, sometimes, that for a druid to know will lock them away from their art forever,” said Solace. “It’s usually more about how the druid relates to the world, and how the world relates back to the druid. You told me that the airspeed velocity of a swallow was twenty-five miles an hour, and do you recall my response?”

“Yeah,” I said. “You said that wasn’t actually knowledge, it was just … a way for people to pin things down without actually conveying truth, or something like that.”

“Yes,” nodded Solace. “That is how I relate to the world. That is what a true druid is, at the core of their being. It doesn’t matter that you told me this thing you believe about swallows, because it’s only true within a framework that I have utterly rejected. That one is easy for me; others are less so. For all that Amaryllis rushes to defend me, she makes the same mistake that you do. She says, flatly, that I can turn the five of us into birds, and then she begins thinking of that as a tool within her toolbox, a cog within the clockwork of strategy.”

“And … it’s not?” I asked.

“It is,” said Solace. “In the same way that a swallow goes twenty-five miles per hour. It’s a lens through which we might view the world, one that lies far on the side of desiring to place everything within systems and order, removed from the wonder and mystery of actually turning into a bird.”

“Ah,” I said. “I … kind of get it. Maybe. And it’s bidirectional? It’s not just what you personally think about your art, it’s what others think too? How neatly they’ve done the work of fitting a square peg into a round hole?”

Solace nodded. “It’s fuzzy. Everything about being a druid is fuzzy. But yes, when the Second Empire’s efforts at bringing order were met with revolt from the loci, they did try other methods, like keeping the druids ignorant of their plots and plans, or doing tests with unwitting druids. That didn’t work either.”

“Huh,” I said. “Is this something that we need to be worried about? You said that I couldn’t hurt the locus by thinking the wrong things, but … that doesn’t seem to be quite true.”

“A druid and a locus are different,” said Solace. “I practice the art of druidic magic, but the locus is that magic. For myself, it’s not the seeking of truth so much as the rigidity of thought that might put me at risk, but I’ve been doing this for four hundred years, and thought alone is an irritant, not a true threat.” She looked me over. “I think that’s enough. You understand at least some of what I’m trying to convey.”

“So what’s the great druidic virtue then?” I asked. “Doublethink?”

“Hrm,” said Solace with a small smile. “We would say saxud, but that would be a good translation. It’s not enough, on its own, I don’t believe that druidic magic could work if it were so simple, but it’s the element we lean upon most often.” I opened my mouth to ask another question, but she held up a hand. “I would request that you stay your tongue, unless you think it’s of dire importance.”

“It’s a matter of history,” I said. “Nothing to do with your art.” Solace nodded for me to proceed. “I’m not sure I understand what the Second Empire did, or how they did it. Did they analyze the loci
to death, and if that’s what it was, how did yours survive that?”

“Oh,” said Solace, eyes widening slightly. “No, they infringed on the druids through their actions, their attempts at treaties, their science, but that was nothing that we couldn’t have endured. No, they saw land worth taking, and something standing in their way that couldn’t be captured or turned to productivity, and their extermination campaign began in earnest after that. They were unrepentantly evil.”

We were quiet after that, as Solace looked out the open window and I fidgeted with the Anyblade. I didn’t quite believe her version of events with regards to the Second Empire. It was possible that Aerbian history had this period where Pure Evil was in charge, but my guess was that it was more just people being people, which meant people being shitty to each other. Druids were probably a scapegoat for some larger problem, or a distraction meant to take eyes away from poor policy, or a rallying cry that resonated with people in a way that a complex issue might not.

I did have to wonder how much the upcoming battle, if there was one, would depend on Solace. She was the ace in the hole, the black swan that Larkspur would (should) have no possible method of accurately guessing we had on our side. I was hoping that she would show her true worth.
I drew a seven of tines, which meant we’d go in the middle 60° arc, then drew the virgin, which was card #57 according to my scheme. I considered the card somewhat suspect, but I had done a lot of shuffling and wasn’t going to reduce our probability spread by getting superstitious about the kabbalistic meanings of the cards. If the Dungeon Master had picked a specific card for me to draw on the basis of something that I had been giving some thought to as of late, then I doubted I would be able to improve matters by simply drawing another card from the deck.

Solace transformed me into a swallow again, then herself, and we took off together, flying side by side. I relaxed slightly as we passed the city walls, because that meant we no longer had to worry about a last-second ambush. It was mid-morning and a pleasant day for a flight, and I tried to take joy in it as I internally counted the minutes.

After an hour’s flight and (approximately) twenty-five miles in a straight line away from Boastre Vino, we circled around to a copse of trees with some large stones at the center. Grak had said that if we had much of a choice, he wanted us to be somewhere with lots of obstructions, because in accordance with Goettl’s Laws, it was easier to make a ward if you had something to brace it on. His plan was to tap completely dry in making the wards around us, in the interests of having as powerful (and numerous) of wards as physically possible, or if we engaged the enemy sooner, then to put up wards until they showed up.

As soon as we landed, Solace pulled the others out of the bottle by first diving inside and then having everyone spit out of individual trees, like a dendritic version of the birth process. I noticed there was no tree tunnel this time, and the fact that Solace was making an effort not to repeat herself seemed, to me, to be more than just showing off on her part. It was, maybe, a way to avoid falling into patterns or seeing the druidic magic as something that had to adhere to doing things the same way every time.

While Grak got to work, Fenn grumbled briefly about sightlines and then began to climb a tree, and Solace began walking around in order to scout out the territory. That left me with a slightly-rumpled looking Amaryllis, who was rubbing her eyes.

“The Elon Gar have a way to eliminate sleep,” she said. “The masters need ten minutes of quiet meditation a day, and that’s it. This is the first time I’ve ever slept in full plate. I wasn’t too impressed by the experience.”

“Can we talk?” I asked.

“Sure,” said Amaryllis, looking slightly more alert. “Something serious?”

“Um,” I said. “It’s about capital-L Loyalty.” In other words, sort of serious, but not deathly so.

“Oh. And?” asked Amaryllis.

“Well, Fenn passed level 10 Loyalty, I’m not sure whether she told you that or not?” I asked.

“No, she hadn’t mentioned it,” said Amaryllis. “And what does your internal system say that I’m at?”

“Nine,” I said.

“She’s at eleven?” asked Amaryllis.

“Sixteen,” I replied.
“Ah,” said Amaryllis. She hesitated. “Sorry.”

“No,” I said. “I wasn’t bringing it up because, yeah. That whole thing.” The bad blood. The mistrust. “No, when Fenn passed Loyalty 10 it unlocked this thing called ‘Twinned Souls’ that probably doesn’t have anything to do with the actual, literal soul, but makes it so that she’ll get stronger as I get stronger. I think it’s a balance thing, so my companions don’t get left behind me. And given that you’re just one point away, I was wondering whether there was anything that I could do that would, I don’t know. Help with that.”

“Huh,” said Amaryllis. “Give me a second?”

“Sure,” I said. I stepped back a bit and watched Grak move between the trees with his wand in hand, tracing out an irregular ward with the trees as anchor points. A border ward against high velocity was a must, given the risk of heavy-duty machine gun fire. Everything else was at his discretion, especially because my knowledge of wards was being increasingly off-loaded onto him. Raising Grak’s loyalty, somehow, was on my list of priorities, but it wasn’t terribly high, partly because I didn’t actually know how to raise loyalty, other than by trying to be a generally good and understanding person.

**Loyalty increased: Amaryllis lvl 10!**

**Companion Passive Unlocked: Twinned Souls (Amaryllis)!**

I turned to Amaryllis. “What just happened?” I asked.

“Is that working?” Amaryllis asked.

**Loyalty increased: Amaryllis lvl 11!**

“What are you doing?” I asked. “How are you … are you becoming more loyal on purpose?”

“Yes,” said Amaryllis.

**Loyalty increased: Amaryllis lvl 12!**

“You can’t do that,” I said. I will admit to some slight panic on my part, maybe because there was something in the back of my mind that said trying to munchkin the game too badly was going to end with the Dungeon Master putting his foot down. “You can’t just, become more loyal because there’s something in it for you, that’s not how loyalty works!”

“Well, clearly you don’t know as much as you think,” said Amaryllis. She looked down at her hands, giving them a flex. “I think I can feel the change.”

“Please,” I said. “Tell me what you did, or what you were thinking?”

“Well, you already said,” replied Amaryllis. “Obviously my loyalty is because I get something from you, isn’t that it?” There was something slightly hostile in her tone. “Is that really what you think?”

“No,” I said. “I mean, it doesn’t make sense, Grak didn’t become more loyal when we decided to pay him a ludicrous amount of money, I just don’t think that it’s keyed to literal rewards. And I didn’t think that you could become more loyal on purpose, but maybe I’m wrong about that, and if I am, then you became more loyal on purpose after I told you there was something in it for you, so …”

“You don’t understand me,” said Amaryllis. “I don’t think I’m really all that complicated.” She sighed and ran her fingers through her short brown hair. “You understand that my plan, even early
on, was to elevate you as much as possible, right?” she asked. “Once I saw how quickly you picked up blood magic, how easily you blew past what I had spent years studying, I thought to myself that you were the key to my return to power.” She rubbed her face. “That changed, over time, but the same thing has been at the back of my head from the start, which was that if you were the same as Uther Penndraig, then I was never going to be one of your knights of the Square Table. Even if I put my heart and soul into training, I was never going to be able to match the people you would pick up along the way. I’d at best be a wallet for you, or a love interest if I --” she stopped herself from saying something, “I knew that I couldn’t keep pace with you, and I knew that what I had to offer you wasn’t going to be worth much, especially if we couldn’t get me back into power in Anglecynn, and -- I’ve been worried about this for almost as long as we’ve known each other.”

“Okay,” I said slowly.

“You wiped that away,” said Amaryllis. Her posture had changed somewhat, relaxing. “You wiped that away without even thinking about it. There wasn’t some calculation going on in your mind where you were thinking that I might be more useful if I was trying to win your approval, or if I were in a position of weakness compared to you. You didn’t think about the power dynamic between the two of us. So,” she said. “Maybe I’m a worse person than you, because I would have had those thoughts, but if you didn’t, then yes, there were some things I needed to let go of and recurring thoughts I could toss aside. Hence, loyalty.” She rubbed her eyes again. “I’m sorry, I just woke up and I’m running on less-than-enough sleep.”

“I think that if you tell someone that you’re going to try to trust them more, you have to actually do that,” I said. “So a lot of it is on me.” I looked her over. She was right that I didn’t understand her. “Let’s not have every conversation between us go like this. So ... serious.”

“Agreed,” she said with a soft smile. She looked up to the tree tops. “So, you and Fenn?”

I felt my chest constrict at that. “Um,” I said. “Kind of. Not actually, in the sense of, uh, we haven’t -- it’s nothing official, or unofficial even, but, yeah. We’re sort of … thinking about it. I am, anyway, I can't say for her.”

“Thinking about it while sharing a bed?” asked Amaryllis with a raised eyebrow.

“Ah,” I said. “If you mean at the hotel, they were going to be two separate beds.”

“Were they actually?” asked Amaryllis, still keeping her eyebrow raised.

I thought about that for a bit. “When I give that some thought, no, they probably wouldn’t have been.”

There was sound from the trees overhead, and I watched as Fenn made her descent, moving with a grace and agility that screamed inhuman to me, though I was pretty sure that it was also the sort of thing you’d see on Youtube and think, ‘Wow, people sure can do some amazing things if they devote the time and effort to it’. She didn’t even seem to vary her speed at all, like she was doing parkour and using every action, pushing off tree branches, stepping lightly for just a moment, in order to ensure that she kept her movement eerily constant.

A small puff of exhaled air was the only evidence she’d been exerting herself over the course of her rapid seventy-foot climb down.

“Am I really that predictable?” she asked. “See, I was going to exclaim what a crazy random mix-up there’d been on the part of the hotel, I had this whole bit planned about how we would just have to make the best of being stuck under the same covers.” She grinned at me. “You know, I heard all of
that. And before you start, you really can’t complain about someone eavesdropping if you watched them go up into the eaves.”

“Eavesdroppers sit under the eaves of the house,” said Amaryllis with a frown. “You’re thinking of rafters.”

“Eavesdropping, raftersdropping, it’s all the same to me,” said Fenn. She was smiling my way. I was blushing, and my heart was pounding, because it was all sort of out in the open now, especially given who I’d been saying it to. Amaryllis didn’t really look put out at all, but she was good at masks, when she needed to be. I had no idea whether she felt any romantic inclination toward me at all, with the unicorn kiss only serving to make me feel more uncertain. ‘Or a love interest if I --’ was still there in my mind, making me wonder, but if it came down to a choice between the two of them, I had now cast my lot, which had left Fenn smiling and made me feel wonderful.

(Maybe it was the (possibly) upcoming battle against whatever forces Larkspur could muster, which had already set me on edge, but the idea of a proper relationship with Fenn was terrifying in an exhilarating way. I’d fucked up both friendships and relationships before, she was my best friend, we were joined together by a mysterious force that we didn’t really understand, and from what I knew of her personally she wasn’t built for a long-term stable romantic partnership, or at least had about as much of a chance to learn how to do that as I had. So there were lots of reasons that it was probably a bad idea, but we were, apparently, going to be an actual thing instead of just flirting around the subject.)

“So how long are we going to wait for this guy to show up?” asked Fenn, thankfully changing the subject. I might have been imagining things, but I thought I saw a slight blush on the pale skin of her cheeks. “A full day here?”

“We moved once an hour, which was probably overkill, given that we didn’t have any close calls,” said Amaryllis. She turned her helmet over in her hands. “I would guess that if he comes, it will be between two hours and a full day. The longer the wait, the higher the danger to us, because I don’t doubt that he would use that time to rally whatever forces he thinks he needs to bring to bear.”

And that was what worried me. If he showed up, how much was he willing to risk overcommitting? How much was he going to pull people off projects, put them in danger, risk operational security, or incriminate himself? We were hoping that he was going to come in overconfident and underprepared, but it was all up in the air.

Grak took six hours to finish the wards, going in order of what he called the inverted pyramid of potential threat. The most important layers of warding were up within the hour, and more and more pieces of warding became functional after that. None of them were going to last particularly long; one way or another, we would be gone before the clock had run out on them. After Grak had placed the last of them, he came back to join us by the stones, sweating slightly. During the long wait, Amaryllis had fallen asleep, propped up against the rocks, and Fenn had joined her, with her head resting on a pillow in Amaryllis’ lap. Solace was lying in a shaft of sunlight, moving every so often to keep pace with it, like a cat; she had her garments pulled aside to reveal as much bare, green flesh as possible, which left her obscenely indecent by Midwestern standards. I hadn’t designed the crantek as nudists, but I don’t know what I thought halfway photosynthetic creatures would be doing walking around in clothes.

“I just spent a full week’s worth of concordance,” said Grak. “It’s been a long time since I’ve done that.”

“And you think we’re good?” I asked.
“No,” said Grak. “I think I’ve prepared against most reasonable vectors of attack.” He sniffed and looked at the women. “Void weapons are not magic. They would be a problem.” So naturally, if Larkspur knew for certain that we had a warder, or maybe just guessed based on whatever evidence he’d gathered, that would be one of the primary weapons he brought, and it wouldn’t matter whether there was an imperial ban, since he’d already shown himself willing to violate those.

“Thanks,” I said. “You might want to get some sleep, while you can.”

“I’m doing what I’m paid to do,” said Grak.

I looked him over. “I’m not sure I believe that,” I said.

“Which part?” he asked with a frown. “I am putting up wards. I am being paid to put up wards.”

“I don’t think that’s all there is,” I said. “I think we’re paying you handsomely, and we do need your hard-earned abilities, but … what are you after?”

“Penance for my clan,” said Grak, as I knew he would.

“And you want to pay that penance as quickly as possible, so you can return to them?” I asked. I didn’t say outright that his penance was self-imposed, but the quest I’d gotten for him used that phrasing.

Grak looked away from me. “No,” he said after a time. I waited for him to elaborate, but he didn’t, which meant I could either take a stab in the dark or let it drop. I didn’t really have much else to do besides talk to him, but trying to get him to open up about something that I’d already given him a (rejected) option to talk about didn’t seem like it would be worth anything. Besides, I hated when people tried to do that with me, and more often than not I turned sour on them after they failed to take a hint.

“So,” I said. “Can you teach me how to speak Dwarven? Unless you were planning to sleep more?”

Grak gave a loud sniff. “Dwarves can go longer without sleep than humans,” he said. “It’s better I stay awake. I’ll need to give warning if I detect a crossing of the wards.” He sniffed again, with his wide nostrils flaring. “It’s called Groglir, not Dwarven, if you want the common tongue of dwarves. The language of my clan would not suit you.”

“Okay, Groglir,” I said. I had taken some Spanish in high school, but wasn’t actually sure how you were supposed to go about learning a language, let alone from a different place, let alone one suited for a different species. In the worst case, Groglir would be unpronounceable to the human tongue because of the differences in physiology; the thick teeth and wide tongue would prove themselves capable of making two sounds that I couldn’t distinguish between, or one I couldn’t replicate, or one I couldn’t even hear. I was hoping that the game would act like a proper game for once, and have already arranged for me to not have to worry too much about things like that.

So Grak took the lead, and I started to learn some Groglir nouns. He would point to something, like a tree, and say, “Tree, mara, tree,” and then I would repeat after him. From time to time, he would go back to something, and I would try my best to recall what it was he’d said. At a certain point, when I had something like thirty Groglir words under my belt, he started in on noun morphology, which was ridiculously confusing, partly because Groglir was an ergative-absolutive language rather than a nominative-accusative language like English. (Technically speaking, on Aerb they spoke Anglish rather than English, but other than the slight difference in initial vowel, there was pretty much no difference.) Beyond that, in the same way that nouns could be either masculine or feminine in Spanish, Groglir had five noun classes, and they (obviously) didn’t even cleave along gender lines.
Once he taught me my first verb, *dalkelor*, meaning “opened”, I could make my first actual Groglir sentence, which was “Grakhuil in nogor dalkelor”, or “Grakhuil the door opened”, because of course the first language I came across in Aerb would also have subject-object-verb ordering, just to be extra confusing.

“You know a lot about language?” I asked.

“I learned Anglish late in life,” said Grak. “It was a necessity for learning at the athenaeum. My clan didn’t have the money to spend on a yearly translation tattoo. Children learn languages in the natural way. Knowledge and order help adults more. I learned Anglish using rules. My understanding of Groglir is governed by that same understanding.”

I did wonder how true that was to the mortal species in general, dwarves in particular, or whether it was just Grak specifically. My own understanding was that language was intuitive, which was one of the reasons that it developed so many idiosyncrasies. Learning rigid rules and then applying them uniformly seemed like more of a dwarf approach to things, but it was hard to say whether that was the truth or not, because I had only ever met one dwarf, and he had spent at least ten years away from his clan, changing enough in that time to want to leave his people behind.

By the time Fenn woke up, I had a small handful of phrases I could use, assuming that I didn’t want to change tense, and about fifty words that mostly related to things that were within pointing range. I still hadn’t gotten a pop-up that said something to the effect of, “Hey, you tried hard enough, you know Dwarven now!”, which is what I was not-so-secretly hoping for.

“Well, we’re not dead,” said Fenn with a yawn and a stretch. “How long has it been?”

“Eight hours since we arrived,” said Grak. “Nothing from the wards.”

“Wake Solace,” I said to Fenn, trying not to glance over at the partially nude crantek woman.

“I’m awake,” said Solace from her spot in a sunbeam. “I’ve been awake.” It was afternoon now, and the sun was coming through at an angle, but she was somehow still fully lit. When I looked up at the trees, I saw them bowing out, spreading their leaves to the side to allow a shaft of light in. She put on her clothes with slow, languid motions. “The field mice have relayed to me that all is quiet, and the trees agree.”

“Shit,” I muttered.

“If he doesn’t come, all we’ve wasted is time,” said Fenn. “I’ll get to poke an arrow through his skull another day, I reckon.”

“Yes,” I said. “But that means that we’re consigned to a pretty damned long time trying to work beneath the radar.” I rubbed my hand, trying to get some feeling back into it again. It was getting worse with every passing day, and I was worried that the endgame would be that I wouldn’t be able to use it on instinct anymore. “Not that we wouldn’t be, even with him dead, but without the driving force of Anglecynn’s FSD I have to imagine we’d have an easier time of it.”

“We have time,” said Amaryllis, who stood up and stretched out with a groan. “Glove carrier, food please,” she said in Fenn’s direction.

“Yes, your highness,” said Fenn with a bow. She held out her hand and a small table popped out of thin air to settle on the forest floor. She kicked it slightly and then moved it around, until the legs were more firmly in place, then began unloading enormous amounts of food from her glove, cold pasty pies, thick slices of meat, a colorful array of fruits, two loaves of bread, five bowls of what I
took to be some kind of cold soup, and finally, a whole chocolate cake decorated with what looked like elongated cherries.

“I think it might be in our favor if he doesn’t show,” said Amaryllis as she grabbed a pasty. “That says something about his positioning and his strength, if he doesn’t think that he’s strong enough to take us on in this sort of scenario.”

“Oh it’s bad, because it means he’s smart enough to have realized that we weren’t just stopping here for our health,” I replied. “That means he’s more patient and cunning than we’ve been giving him credit for, and he’s content to just sit back and make our lives miserable from a distance.”

“He’s not,” said Amaryllis. “And he can’t risk that I decide to settle down for a quiet life and start having children. I’m the most direct descendant of Uther Penndraig, but he’s the most direct male descendant, which gives him claim to roughly a fourth of what I have. Hyacinth is second most direct female descendant, which means that together they could lay claim to every heirloom that I have claim-in-fact to right now. Most of those, I assume, they already have physical possession of. But it stands to reason that giving up a fortune in heirlooms and places with wards keyed to me will mean that he’ll never be content, especially not when I might get pregnant at any moment and perpetuate that problem.”

“Is that how you think getting pregnant works?” asked Fenn.

“I am well aware of how it works,” said Amaryllis, quite dryly.

“All I’m saying is that I don’t think there’s much upside to him not showing up,” I said. “The information it gives us is minimal. We avoid a battle with him today, but we’re probably in for a tougher one tomorrow.”

“Oh we just assassinate him,” shrugged Fenn. “That would work too.”

Solace raised an eyebrow at that.

“I don’t think we’re in the business of assassination,” I said.

“No?” asked Fenn. “Because what we’re doing here, setting a trap and then claiming self-defense, that’s so unlike going into his bedroom and slitting his throat in the middle of the night?”

“I agree with the elf,” said Grak.

“Half-elf,” said Fenn. Her ears twitched slightly. “I think maybe this is all moot, because we’ve got company.”

“Helicopters,” said Solace. She brought her staff down and struck the ground with it, closing her eyes as she did so. “Five helicopters, six men and a pilot each.”

“Can you tell if Larkspur is there?” asked Amaryllis. I saw that the teleportation key was in her hand; the plan was that in battle, it would go to Fenn, who was waiting impatiently next to her, all thoughts of food forgotten.

“No,” said Solace, opening her eyes. Her face had an intensity that I hadn’t seen from her before. This was a woman who had known battle. “Most were human, armed with metal weapons, two-thirds of their number armored, others I would assume to be mages. One of the helicopters is special.”

“In what way?” asked Amaryllis.
“I’ve said as much as the winds gave me,” said Solace.

“Thirty men seems like a lot,” I said.

“Go or no-go?” asked Fenn. “Either I’m up the tree to shoot a few thousand arrows their way or we should get the hell out of here.”

“Go,” said Amaryllis, handing over the key.

“I disagree,” I said. “Thirty men of unknown strength bearing down on us? That’s more than we were talking about.”

“We can cut their numbers down before they arrive,” said Solace. She twirled her staff in front of her and set it in the ground with her fingers gripped on the bird’s skull there. Immediately, the weather began to change, dropping by a few degrees as wind started to move and the skies darkened.

“I have faith in my wards,” said Grak.

Fenn took off without another word as the teleportation key disappeared into her glove, climbing the tree like it was no more difficult than sprinting across flat land. I felt a pain at her leaving, worried that we were fully committed to this fight. I’d been quietly voted down by my teammates, and if we left, it was going to be after a brief skirmish showed that the odds were badly stacked against us.

The winds were picking up, blowing gusts of cold wind our way. I had my Anyblade in hand, extended to full length and ready to swing. The copse of trees we were in wasn’t thick enough or wide enough to give us full cover from the fields around it, and I kept looking out there, straining to see whether I could hear the helicopters or not. The winds weren’t helping with that, and I hoped that they weren’t going to be strong enough to force the pilots down before they got within range (and on the other hand, I was really, really hoping that, because then maybe we wouldn’t have to fight).

I looked up the tall tree that Fenn had climbed and couldn’t see her at all. Her bow had seven artillery shots left in it, per her accounting, and given what a well-made arrow could do to plate, I was hoping that a helicopter would fare equally poorly if faced with an entire volley. All you would need was one in the rotors to bring a helicopter down. Just as I started to hear the thumping of multiple helicopters coming our way, I heard the twang of Fenn’s bow. I couldn’t see her, or the arrows, but I could imagine some poor pilot suddenly faced with a cloud of arrows that seemed to have come from nowhere.

I saw Fenn tumble from the tree, touching branches briefly to control her fall, and saw the tree-top explode in a ball of orange flame a few seconds after that.

“Think I got one!” she shouted with a breathless smile as she landed in a roll. “They’re not fucking around.”

Two flashes of bright white light came from between the trees, followed shortly after by overlapping waves of rolling thunder.

“That’s two more down,” said Solace, raising her staff from the ground and looking slightly dazed.

“Show-off,” muttered Fenn, but I knew her well enough to see the nervous energy coursing through her and the tenseness of how she moved. “Joon, follow me to the front?” She took off through the woods, moving swiftly, until we got to the line of trees that Grak had marked for us, which were the anchors for the wards he’d put up and a helpful guide for what was and wasn’t safe.

We peered out through the few trees between us and the fields to the east, waiting and listening. The
helicopters would be flying low, if they hadn’t turned tail and run. Soon they were in sight, three helicopters, two black (one trailing black smoke), and a third that had an impractically ornate design to it, apparent even from a distance. At a guess, it was designed by someone in a forge-frenzy, and that meant that the helicopter possessed some unknown and presumably dangerous magic.

Fenn stepped out from the protection of the wards for long enough to fire two arrows, both of them artillery shots that blossomed into thousands of arrows. I could see now that the helicopters were of simple design; I wasn’t sure why I was expecting Apaches, given Aerb’s demonstrated level of technology. They weren’t laden with weapons, nor heavily armored as I had thought they would be. They were moving in a dangerously close formation, the kind of thing you would never do on Earth, not just because of the technical skill it would take, but because you’d risk getting blown out of the sky by a single SAM.

The reason for that close formation was made apparent when the arrows got near them; thousands of arrows turned into sparks as they got within range of the baroque helicopter in front, so many at once that it was an almost blinding display. The shield, or whatever it was, was shaped like a sphere, centered around the lead helicopter, which raced through the cloud of sparks without seeming to mind. Someone leaned from the side of the helicopter, out the open door, and Fenn stepped back into the safety of the wards just in time for a fireball to splash against them, detonating a tree in front of us. The pieces of flaming wood hit the wards and all that crossed over to us was a warm breeze.

One of the two black helicopters, the one that wasn’t having mechanical trouble, turned to the side and began to land. Fenn began stepping forward to fire another artillery shot off at it, but stepped back almost at once, just in time for another fireball to blast its way directly against the ward in front of us, again sending up a wave of heat but sparing us from the shrapnel, which was reduced to a low enough velocity that it was merely annoying.

“Shit,” said Fenn. She raised her hand as I saw movement within the belly of the helicopter, and with her other hand she pulled me down behind a thick metal wall that appeared from her glove. “You know,” she said, as a sound of thunk thunk thunk thunk started up from the helicopter, “Here I was, thinking that maybe we’d be able to make this a half day.” She was giving me a manic smile. “Mounted automatic void rifle, probably,” she said with a nod in the direction of fire. “I’ve got a few of these walls, not sure if we should retreat or not, but staying here is probably not --”

There was a loud crunching sound, which cut off the seemingly endless series of thunks. Fenn paused and poked her head up over the metal wall, then grabbed me by the arm and pulled me up too. The helicopter was protruding from the ground at an awkward angle, with pieces of metal twisted around and shattered glass littering the area around it. There was a considerable amount of blood.

“Oh,” said Fenn. “I will give that druid credit where credit is due.” She pulled out her bow and fired an arrow toward where the other two helicopters were landing, two hundred feet away, but the arrow was just a test shot, and it exploded into sparks as it hit the invisible globe.

“If they have another gun like that, we’re fucked,” I said. “Walls only hold until they flank us. If they can move or split that point defense --”

“Retreat,” called Fenn, either because her sense of luck was telling her to, or because she’d reached the same natural conclusion I was a second away from.

We raced back through the trees, back to the tall rocks that the others were near, which provided useful cover from void weapons. Effective range on a void weapon was five hundred feet, if you wanted to actually do any damage with them, and I had to hope that meant we would be able to out-maneuver them somehow.
“Status?” asked Amaryllis. She had put on her helmet and was looking suitably frightening.

“Solace got another helicopter,” I said. I looked at the crantek woman, who was leaning against her staff. “They have fully automatic void weapons, and some kind of shield that vaporizes arrows. I don’t think we can win.”

Amaryllis flickered her sword on and off, then reached behind her back and unslung her void rifle, which she handed to me. I shrank down the Anyblade to its bladed-ring form and took it.

“We killed three-fifths of their forces,” she said.

“Solace did,” I replied. My eyes went to the trees, which Grak and Fenn were both watching carefully, then to Solace herself. “Do you have more of those in you?”

“Not like that,” she said with a shake of her head. (Because she didn’t believe she did, because of the structuring risk, or because of inherent limitations to the art?) “The trees will help us.”

“They’re past the outer perimeter,” said Grak, hefting his axe.

“The five of us cannot kill fifteen well-trained men,” I said to Amaryllis. And that was probably true even if there weren’t any mages among them, which there almost certainly were. I was feeling a shudder of terror down my spine when I thought about how fucked we were likely to be if we were against fifteen people of the caliber of Aumann’s crew.

“Twelve now,” said Solace, as I heard a scream in the distance.

“They’re circling in squads,” said Grak. “It would be a good time for the fallback ambush.”

Amaryllis watched me for a second and nodded. I wasn’t happy about it, but I was the only one that seemed to think that our advantages weren’t enough, so we all circled up and touched Fenn as she held the teleportation key out. A flip of a card from the deck later, showing the joker, and we were off and away.

We didn’t go far, only two hundred yards, which put us in the woods close to where the helicopters had landed. The great thing about the teleportation key was that it didn’t just allow for us to travel the world in an instant, it also allowed silent, near-instant movement around a battlefield, especially because we’d done the smart thing and made a circuit around the place before the enemy had shown up. The major downside was, obviously, the two hour time limit, which meant that we had now committed ourselves to actually fighting this battle.

The helicopter pilots were still waiting in their respective helicopters, each one angled such that the mounted guns faced the copse of trees. If Solace’s count was right, there were only twelve men in total, minus the ones she had killed just before we left. If we could stay at a distance and have her pick them off one-by-one -- but I could see that wasn’t going to be possible, because she was barely able to stay standing by leaning her weight on her staff, which meant that we were four people against ten, at best. And if I were Larkspur, I would have put all of my best men into the magical helicopter with me, protected there, which meant that we were likely to be facing down the best of the best.

And just as I was contemplating the unpleasant version of reality in which Larkspur didn’t even show up and this was all just the slaughter of his men, rather than him coming himself, we spotted him. He was with the horned woman and a grotesque man covered in visible boils. Larkspur wasn’t in his usual get-up; instead, he was wearing a completely different armor, a simple breastplate and greaves that left his arms exposed. They probably had some powerful magic to compensate for that.
His cloak was still there though, and he had two swords, one at either hip, in addition to his familiar mirror shield. I looked at them through the spyglass that Fenn had produced from her glove, then handed it over to Amaryllis.

“Pustule mage,” she said at a whisper. “I think I might know him.” She swept the spyglass over. “The good news is that the rest are probably Golden Cete, part of the Color Riot, trained soldiers at a high rank. I don’t think he has a revision mage with him, he would have used it by now.”

I was nervous, sweating in my armor even though I hadn’t really exerted myself. It wasn’t the thought of killing anyone, it was the idea that there were too many people for any of this to be properly predicted. The zombies had been scary, but at least a little unreal to me, shambling creatures that wouldn’t have been entirely out of place in a movie. Individual fights weren’t as much of a problem for me either, because I’d been in a fair number of fights back in Kansas and at least understood the reality of taking a beating. Here, we were waiting on the edge, up against twice our number of people who had either experience or training in this sort of thing, and they wanted to murder us. My instincts were screaming at me to run, and I wasn’t entirely sure that those instincts were actually wrong.

“I need a test shot against the helicopter,” said Fenn, keeping her voice low. “I need to see whether or not the shield is around it, or Larkspur.”

“That will alert them,” I said.

“I can put up a ward against sound,” said Grak. “I’ve recovered enough for that, I think.”

“Fine,” I said. “Don’t actually hit the helicopter, just get the arrow close enough that we can see, and on the opposite side from them.”

“They’re not looking,” said Amaryllis, who was watching through the spyglass again.

It was a few moments later that Fenn loosed her arrow, the sound of the bow undetectable and the arrow completely silent in flight. It came within a foot of the ornately decorated helicopter, but there was no effect of sparks, and it simply continued on until it buried itself in the shrubbery. No one seemed to notice it.

“Well, crap,” said Fenn.

“Void rifle will still get him,” said Amaryllis. “If we can get close enough.”

“We’re locked into killing all of them now,” I said. “We can’t teleport out.”

“We can hide inside the bottle and fly out,” she replied. She frowned when she glanced at Solace and saw the state she was in.

“Probably,” said Solace, answering the unspoken question. “The locus is less powerful than it once was. I may have overdone it.”

“Look, if we’re going to do it, we need to split Larkspur off from the others,” I said. “The pustule mage is the one shooting fireballs, right?”

“They’re not going to split,” said Grak. “They have no reason to.”

I rubbed my face. “And he’s limited by the growths he’s put on himself, like a flesh version of a flower mage?”
“We can’t run him dry, if that’s what you’re thinking,” said Fenn. “Not if he was prepared, which I guess he might not be, given the short notice.”

“Then what are our options, at this point?” I asked. “Get close enough to shoot the pustule mage in the head, enter into melee combat with Larkspur, and then hope that the other men in the woods don’t just come out and shoot us?”

“I can kill them,” said Solace. “Or at least stop them. It’ll be easier up close, if that’s what we’re doing.”

“I’ll circle around,” said Fenn. “Snipe them from the other side. Better to do it now, as they’re moving through the woods and mindful of wards.” She looked at me with a faint smile. “I’m a better shot than I was a month ago, believe it or not.”

Amaryllis had said she could feel the power that came with Twinned Soul. I had wondered about that, and what it might mean for Fenn, but apparently she had noticed the effects too. My own personal build was a generalist one, with the exception of social skills, but if Fenn had stats, and those stats were arranged to give her a comparative advantage in archery, then -- well, I had already run the numbers before, she could be up in the 50s for that one skill, and even if she didn’t have stats in the way that I did, it might not be unreasonable to expect that she would be capable of some impressive feats.

This was the first thing that had given me any confidence.

“Okay,” I said. “Then it'll be myself, Amaryllis, and Grak to deal with Larkspur and his friends, with Solace and Fenn to deal with everyone else?” I asked. “Amaryllis, you’re certain that they’re all Golden Cete, there won’t be any surprises?”

“They sometimes have blade-bound in their ranks,” she replied. “We’ve seen how Fenn deals with them.”

“I’ll kill the pilots on the way over,” said Fenn. “Spyglass.” When Amaryllis handed over the spyglass, Fenn raised it to her eye and looked at the woods. “Larkspur is moving in, we’re going to need to go now, while they’re still trying to figure out what happened.”

She tossed the spyglass to Amaryllis and began trekking off into the woods; Solace, with little fanfare, became a small blue-feathered bird that flitted through the air and landed on her shoulder.

“We wait until Fenn kills the pilots,” said Amaryllis. “Then we make our move and hope that they don’t regroup.”

“Return my body to Darili Irid if I die,” said Grak.

“You know I would,” I replied. “And if you fall, we’ll pay your penance.”

*Loyalty Increased: Grak lvl 4!*

Amaryllis gave me a look that said, ‘You can’t seriously be saying that we would pay 20 million obols to some random dwarven clan if he died, but you really looked serious when you said that’, or maybe I was just reading a lot into her incredulity. But I wasn’t spewing bullshit, I actually meant it. Maybe we wouldn’t go right away, and we wouldn’t bankrupt ourselves to do it, maybe I would pay for it all out of my own pocket once I was filthy rich, but part of being a friend to someone was being willing to carry their burdens. Grak and I weren’t exactly friends, not yet, but that was how you made friends, in my opinion; you committed to the friendship.
We were five hundred feet from the trees, two football fields distance, hidden in the trees and bushes. I watched with bated breath as Fenn moved across the open space to the helicopters, placing herself such that the helicopters themselves hid her from view. She sprinted, utterly silent under the sound of the wind but incredibly visible and exposed if anyone saw her. When she reached the first helicopter I held my breath, waiting to hear a scream of pain that would alert everyone, or the sound of an actual fight, but Fenn was inside for only a moment, then back out again.

“Got him,” said Amaryllis, holding her spyglass to her eye. “She stopped to sabotage the void cannon,” she continued with a purse of her lips. “Not what we discussed.”

“I trust her,” I said.

“She’s a capable warrior,” replied Grak.

I felt mild surprise at hearing him praise her, but didn’t actually think that he was right, as such. I’d never considered her as that; maybe she was capable of killing people, maybe even good at it, but her flippancy undercut that so much that I didn’t peg her as a warrior. She had made a life for herself going into the Risen Lands and looting them, which meant probably a considerable amount of time murdering zombies, but I had to wonder at how much experience with things like this she actually had. (And I was aware that ‘things like this’ was a weasely way of getting around thinking the phrase ‘cold-blooded murder’ directly.)

“That’s the second one,” said Amaryllis, letting out a breath of her own as Fenn moved away from the decorated helicopter. Whatever magic the helicopter possessed, keeping the pilot alive didn’t seem to be part of it. “She just gave me a thumbs up,” said Amaryllis. She dropped the spyglass to the forest floor and drew her sword, letting out a slow breath. “We should move.”

We raced forward, with Amaryllis in the lead, staying low and trying our best to put as much as possible of the bulk of the helicopters between us and the trees, but we were off-center from them. I felt like a mouse running from a hawk, painfully exposed and with no better option but to sprint forward as quickly and silently as I could. I resisted the urge to pour on speed through blood magic, or to drain one of the bones in my bandolier, because at best I would be leaving Amaryllis and Grak behind. The human eye was attracted to movement, that had been a matter of survival for our way-back ancestors, and that fact kept running through my mind as we ran. Eventually we’d be close enough that a fireball wasn’t feasible for the pustule mage, or that I could simply raise the void rifle and take him out, but until that point we might actually be fucked if he popped one of those pustules in our direction, and why the fuck was I doing this. But I kept running, because I had set myself down this course, and pulling out wasn’t an option anymore.

We were within a hundred feet of them, still out in the open, when the pustule mage spotted me through the trees. He shouted a word of warning and squeezed at one of the yellow-white blobs on his chest, which shot out and away from him at the size of a fist, slower than an arrow but still fast enough that it would have been impossible to dodge, even if I had been more prepared for it.

The fireball struck me in my stomach, but I didn’t feel the impact of it, and the promised explosion never came. A glance down showed a bleached-white, fist-sized circle in the blue armor. I was stunned by that, and faltered for a moment, but raised the void rifle and took a shot at him with my heart hammering but my hands steady. He collapsed like his strings had been cut, the hole impossible to see given the grotesque colors across his skin, but there was no message of defeat. I ducked back behind a tree and poked my head to see what was happening.

The pustule mage’s stomach was swelling, and his arms and legs were shriveling, like his body was a sleeping bag and the real person inside it was trying to gather himself in the center of it. It wasn’t too long after he’d been shot that he burst out through the pockmarked and diseased stomach skin, a full
man reborn from himself, coated in blood and pus. I took another shot at him, but this one was less successful, and I was on the run as he grabbed at his flesh and sent another fireball my way.

The blast knocked me to the ground, which I turned into a roll, shaking my head as I kept moving, trying to ignore the ringing in my ears and the sudden ache in my chest. I was pretty sure that I was bleeding in a few places, even though my armor must have absorbed much of the shrapnel. I kept on running as soon as I found my footing, trying to chart a semi-circle around the pustule mage but constrained by the heavy undergrowth among the trees.

I heard the sound of another fireball above the shouts from around the woods, but this time felt nothing but a warm burst of air from it. I felt a jolt of adrenaline-fueled excitement at that, because I’d made it inside the inner perimeter Grak had set up, and so long as I stayed on the other side of it from the mage, I’d be fine.

I concretely felt the effects of LUK for the first time, as a path of concrete action opened up in front of me, a step to the side that felt so alien I almost stopped myself. A spinning staff scythed through the trees, slowed by the wards but not stopped entirely, and it would have hit me if I hadn’t moved in anticipation of it. The staff threatened to drop to the ground from a lack of momentum, but instead shot backward, weaving its way through the falling trees and leaving a glowing path through the air. The fallen trees revealed the horned woman, breathing heavily and spinning her staff up again. I raised my void rifle and took a shot at her, but there was no reaction of pain or debilitation from her. I moved back behind more trees, keeping my eyes out for the pustule mage and Larkspur, as well as watching my back for the men from the Golden Cete. I was too far forward now, and I knew it, but I needed the protection of the wards.

I saw a flash of metal that must have been Amaryllis, who was much further back than I was, and another step through the trees revealed the pustule mage, who was going hand-to-hand with Grak, or rather, hand-to-axe. Each chop of Grak’s axe sliced through the discolored boils that dotted the pustule mage’s skin, letting loose bursts of wild magic, and the magic of the axe was causing him to grow hair at an alarming rate. The pustule mage was clearly losing that fight. When he lunged backward and reached for a large wart, I took a shot at him, getting a message about a critical hit and seeing him pitch backward into the dirt. This time, Grak was on him in an instant, slamming his axe down repeatedly, engaging in butchery without a word.

Achmed Lawrence defeated!

(And still no level up, a part of my mind screamed.)

I tracked back, trying desperately to find the horned woman, or to spot Larkspur, getting ready to dodge another glowing, spinning staff if I could catch so much of a glimpse of it, or if my LUK gave me the barest hint of what to do. I finally spotted Amaryllis and Larkspur together, out in the field, as she rolled backward away from his strike. He had his shield out and was advancing on her, and she, fully armored but looking frightfully small, was backing away from him.

I raised my rifle again and was about to take a shot when the glowing staff came spinning into view, moving as a vertical disc this time. There was no luck to let me anticipate it, and the only thing that saved my life was a combination of my reaction time and the fact that the throw hadn’t been dead-on. For a moment I saw the glowing disc pass in front of me as it went by, and I thought that I had successfully dodged it before I felt the lightness of the void rifle in my right hand and a searing pain in my left wrist. When I looked down, I saw my hand laying on the ground, and I reached for a bone to heal me before realizing that all I had was a wrist there, an eerily painless glowing wound where my arm simply ended. I threw the void rifle, which had been sliced through, to the ground and touched a unicorn bone just as muted pain began to reach me, and pulled on END as hard as I
possibly could, then moved on to the next bone before the feeling of health and wellness could even begin to fade. My hands -- hand -- was shaking as I tried to keep on the move, and when my stump was no longer painful I extended the Anyblade from its ring shape.

That was about when I started getting messages about the Golden Cete being defeated, first three at once, then one after another in quick succession, with no names given to them, only roles. That part of the battle, at least, seemed to be going well.

I ran through the woods, in the direction that the glowing staff had come from, sword held in hand, trying not to think about the fact that I had a stump instead of a left hand. Surely all I needed was one more kill, and then the pleasure would course through my body, and I would be whole again, refreshed, no longer weakened by the fact that I was having trouble forcing food down, no longer with a twinge of weakness from the blood I’d lost when my arm was nearly amputated.

The horned woman was still spinning her staff up when I got to her, and I reached with my left hand to tap a bone for SPD, before once again realizing that I had no hand there. I used blood magic instead, burning six drops with every step to race through the underbrush and hurdle the fallen trees.

I saw her eyes grow wide as I approached, but she didn’t stop increasing the speed her staff was spinning at, or maybe couldn’t stop when she was so far along. When I brought my sword down, she used the staff to knock it aside, seeming to lose no momentum in the process, and on my second thrust she did the same, swinging the spinning staff from side to side.

I stepped back and let Ropey fall from where he was wrapped around my forearm, then came back at her again. She was either very good at parrying swords with a staff, or whatever ludicrous magic the staff possessed was doing the work for her, but every time I tried to strike at her, even with blood magic behind the swing, she knocked my sword aside. She was glistening with sweat, and every parry slowed her down, which meant that our battle was either going to come down to attrition or a teammate --

She struck out toward me, slamming me in the chest at the cost of all the momentum she’d built up with the staff. I felt a hard crack of my brittle ribs as they were caved in, and she easily danced away from my feeble effort to slice through her. She was turning to run almost from the moment she hit me, and she got ten feet before the rope around her foot went taut, which brought her to the ground with a satisfying whump. When she brought out a dagger from within her clothes, I hurled the Anyblade at her and then crumpled up in pain.

Skill increased: Thrown Weapons lvl 18!

Critical hit!

Superbia Laquis defeated!

I swore as the fourth message I was hoping for failed to appear. That other kill had been mostly Grak’s, but this one was mine, all mine. I swore again and used both fairies and bones to heal myself, which took time I wasn’t sure I had to spare. Then I retrieved my Anyblade from her chest, grimacing when she reached for me with a feeble hand. The game’s definition of ‘defeated’ wasn’t the same as ‘dead’, and while she was choking on her own blood, I could tell that she wasn’t beyond saving, not for someone with my resources. I raised my sword and hesitated a moment, first trying to figure out if what I was doing was a mercy, and next trying to figure out where the best place to land the killing blow was. I ended up driving my sword down through her eye. She jerked slightly and then went still.

New Virtue: Mercy! (CHA +1)
With that done, I started running toward where I’d seen Amaryllis and Larkspur fighting. I got there in short order, using blood magic to hurry my steps, and gave a hoarse shout when I saw that Grak was lying nearby them, bleeding. I ran forward, panting slightly, trying to get in a position where we could flank him. He turned slightly toward me, taking his attention off of Amaryllis for just a moment, and in that moment I saw her lunge forward.

Her blade appeared within his skull, piercing through the bottom of his jaw and up into his cheekbone. He lurched backward, holding his shield up as a defense against her, bleeding from his mouth and saying something unintelligible but probably profane. I gave Grak enough of a glance to make sure that he was still breathing, then stepped forward to join Amaryllis, who was gasping for breath beneath her helmet.

I was a worse swordsman than Larkspur even before I had lost a hand, but with the two of us he was trying to play defense against two opponents, and his armor was no longer full plate, which meant that a slash against his arm would wound him. That was what I went for first, swinging in from the side, and he predictably brought his sword up to parry me. That gave Amaryllis an opening, and she moved forward enough to start flickering her sword on and off again. Larkspur screamed, spewing blood from his previous wounds, as her sword briefly appeared through his hand.

He kept trying to back away from us, but he must have known that it was over, because he started trying to talk. His tongue must have been cut when the sword appeared in his mouth though, because all that came out were unintelligible sounds and blood.

We made short work of him. It wasn’t pretty. He couldn’t handle both of us at the same time, and he was gripping his sword with a bleeding hand. I had reach on him with the Anyblade, and Amaryllis could simply attack when he tried to parry me. When he raised his portal-shield to block her, she went low and put a hole in his thigh, which left him staggering and stumbling, trying more frantically to speak with us.

I swung hard at his neck when Amaryllis darted to the side, and cut halfway through before being stopped by his windpipe. He fell to the ground, jerking around as his body worked hard on voiding itself of blood.

*Larkspur Prentiss defeated!*

*Quest Complete: Slice His Stupid Head Off - Close enough.*

*Level up!*

The golden power ripped through me, starting at my toes and working its way up, and I sunk myself into the pleasure of it, trying to draw out my perception of that glorious moment until I was so overwhelmed by ecstasy that I couldn’t think well enough to do anything at all.
Blood in the Water

Amaryllis was slapping me in the face. This actually hurt quite a bit, because she wasn’t being at all gentle with me. I raised a hand to fend her off and began to come back to my senses. I had leveled, and it had been fantastic, sending me beyond the ability to think. It was disconcerting how quickly the thought of 'yes, that again' went through my head.

“I’m okay,” I said.

“You need to heal Grak,” said Amaryllis. “Now.”

I scrambled to my feet, looking down at my left hand, which was … well, whole again, but still as numb as it had been before, and there was something else off about it, like it hadn’t been replaced quite properly. Even just looking at it, I could see that it was not right somehow, proportioned slightly wrong, making the skin look loose in some places and tight in others. I didn’t really have time to think about that though, so I ran over to where Grak was lying and began pulling out bones from my bandolier. (I quite selfishly wanted to be basking in the afterglow of the level up, and while I wasn’t such a bag of dicks that I would actually do that, that thought was still poking at the back of my mind.)

Grak had taken a hit to the face, which had cut into his lips enough that I could see his teeth through the wound. By the time I had burned through three bones, he was awake and alert, and he pushed off away from me when I tried to use a fourth.

“I’m fine,” he said. “Solace can do the rest.”

I looked back to the woods, which were silent now. I hadn’t gotten any updates from the game about what was going on there, but those had all just been along the lines of the Golden Cete being defeated. There had been two about Golden Cete blade-bound, which was comforting, but we didn’t have a solid enough count of their numbers that I was confident they were all gone … and would the game give me an update if one of my party members died? Or, perhaps more worryingly, if something happened to a valuable member of the party who was technically not a part of it in game terms, i.e. Solace?

So I ran, thinking about Fenn and hoping that she had done her best to stay at a distance and pepper them with arrows, that she hadn’t run into some magical effect that she couldn’t handle. When I got into the woods I started moving more slowly, thinking that it would be utterly ridiculous to have come this far and then get shot in the head by some mook.

I spotted Solace, slumped up against one of the huge, worn rocks at the center of the copse, with the bottle sitting on the ground beside her, the artificial sun she’d put into it glowing brightly. She gave me a faint smile and a friendly wave, which was when I finally lowered my guard halfway (but only halfway, because there was always the chance she was missing something, or this was a trap, and I wasn’t about to be caught off-guard just because I desperately wanted this all to be over). I could see bodies in the woods, most of them sprawled out with arrows sticking in them. There were arrows scattered all over the ground, and hundreds stuck into the trees, most having clearly come from the same direction.

“All clear?” I called to her as I moved forward.

She gave me a weak nod. I remembered that cranteks had dark green blood only after seeing it smeared on her face and clothes. When I saw what she was holding, I rushed forward with wide
eyes; she had Sable.

“Where’s Fenn,” I asked, or maybe shouted.

“She was cut in half,” Solace said, resting her head against the rock. I felt a chill go down my spine. “Shoulder to hip, clean through, that made putting her back together easier.”

“Is she okay?” I said through gritted teeth.

“No,” said Solace. She coughed lightly. “I had to kill that blade-bound on my own. It cost me time. She’s lost blood, probably too much. I pulled her into the bottle, I’m more powerful there, but he cut through her shoulder blade, across half her ribs, narrowly missed the heart, through the hip, it was … not the worst thing that I’ve ever tried to bring someone back from, but if she survives it …” she trailed off. *If she survives it, then she’ll have had the worst injury where Solace’s intervention had actually worked.*

“I’ll give her a transfusion,” I said quickly. “I have two fairies left, I have bones, let me into the bottle.”

“I’m close to having tapped the locus dry,” said Solace, as Amaryllis came up behind me.

“Fenn?” asked Amaryllis.

“Needs a transfusion,” I said. “I’m going in to do it.”

Fuck, I’m blood type B+, that means that I can donate to B+ or AB+, did I actually know that before or was it injected by KNO? Nevermind. What blood type was Fenn, she wouldn’t be able to answer, there wasn’t a simple method to tell unless I could conjure one up from blood magic somehow, and did humans and half-elves have even remotely compatible blood in the first place? Probably, given crossbreeding, but maybe not. How the fuck do you do a transfusion without the equipment? Clonal kit, that’s how.

I took Sable from Solace’s hand and thrust it toward Amaryllis. “Give me the clonal kit, I’m going in.”

Amaryllis hesitated for the barest of seconds, but took the glove from me and closed her eyes for a moment, taking control of it. The clonal kit popped out and she thrust it toward me, and as soon as I had it I turned back toward Solace.

“Put me in,” I said quickly.

“It’ll be the last thing I do today,” she said. “The leaves tell me everyone is dead, but if we need to - -”

“Do it,” I said.

“It’s fine,” said Amaryllis with a nod to Solace. “Juniper, do you know how compatible your blood types are?”

“I -- I’m B+, but --“ I stammered out.

“On the five factors,” said Amaryllis. I gave her a bewildered stare, and started saying some asinine thing about how we needed to do something. She held Sable out toward me and slammed a book down on top of the clonal kit, *The Commoner’s Guide to Blood Magic.* Several bones followed after that, piling up. “Go,” she said. “Don’t do anything stupid.”
Solace grabbed her staff, which was lying in the grass beside her, and tapped it once on the rock. A hole opened up there, which went a foot into the stone before becoming some other place, darkly lit and ominous. Then Solace collapsed onto the forest floor.

I raced forward, stopping for just a moment to grab her, balancing the kit in my other hand, and then moved in through the hole, which was barely large enough for me to go through with both my things and the small woman. This wasn’t like the tunnel through treespace had been, we were somewhere earthy and musty. I heard a grinding sound of the stone closing behind us, leaving us in near-darkness, and pulled Solace’s limp body forward so that she wouldn’t be crushed.

My eyes were adjusting to the light too slowly, so I flared blood magic for flame, which revealed a small room with dried fruits and meats in various cubbies set into the earthen walls. A steep ladder made of tree roots led to where the only light (save mine) was coming from. I propped Solace up to make sure she wouldn’t choke on her spit or vomit, then took the ladder as fast as I could. I came up into the house-tree in the center of the bottle and set the kit, book, and bones down to rush over to Fenn.

She was still wearing her leather armor, or what was left of it. I could see the diagonal path the sword had taken across her body, because there the armor had been pulled away. It wasn’t a straight line; she must have been partially crouched, or turning, as the blade had cut through her body like butter. The seam was red and thick, like a magnified version of what I’d gotten when Solace healed my shoulder, passing from her collarbone, down through her breast, just a bit on the left of her navel, and then through the hip, coming out midway through the leg. She was pale, so white she was almost blue, and sweat beaded on her forehead.

“Shit,” I said softly, and then, “shit” again, because what the fuck was I wasting time swearing for? I started with the bones, draining them into her one by one, going slower than I wanted to in order to maximize the healing from them. The red line faded with each one, until it was barely visible, but that did nothing to improve her color.

I hadn’t read The Commoner's Guide to Blood Magic, I had just skimmed it enough to know that healing was accomplished via transfusion, which meant that in a world where we had magical healing fairies made of marzipan and bones we could pull healing from, it was going to be more complicated and messy than was worth the trouble, especially given that a blood mage could only use it when they, themselves were healthy, and it was only really effective on others. And once Solace had joined up with us, I’d figured that with no less than three other methods of healing, healing via blood magic was probably never going to be that relevant. I’d still intended on powering through it cover to cover, but that had taken a backseat.

And that was all still true, except that in skipping over large swaths of what The Commoner’s Guide had to say about how to heal with blood magic, I had also missed what it had to say on the nature of blood types, which were, apparently, different from what we had on Earth.

It was hard to sit and read a book while Fenn was sitting there, dying, but when Amaryllis told me not to do anything dumb, I was pretty sure that she had meant I should read up on transfusion before just busting out the clonal kit and winging it. And she was right, so I read, trying to keep my eyes from racing ahead to the next sentence. It helped to calm me down though, and I felt my heart rate start returning to near normal as I went through the words. Then I would look over at Fenn, who was probably dying, who had to have lost what, half, two-thirds of her blood getting cut in half? How had she not suffered brain death -- or had she, and that was simply not as serious on Aerb, not with a druid on standby? I returned my gaze to the page, where stupid, boring words were waiting for me.

Even given the above variety of blood seen in the mortal species, the average blood
mage cares most about where that blood falls along the five factors of alignment, which is a categorization system established by the Athenaeum of Quills and Blood in 17 FE in the wake of the Penndraig reforms. Using complicated methods of study, the athenaeum was able to determine normal ranges for five factor blood typing in almost all of the mortal species, as well as how often individuals of these species fell outside the normal range. If tested for blood type, you will be given a five-letter designation, such as IORUM or LPSEM, though testing is not recommended except in rare circumstances.

If you go to visit a blood mage for the purposes of healing and do not know your blood type, they will likely consult one of their books from the athenaeum to ensure that your blood is compatible with theirs. While your blood mage will be trained to tell you the risks, you should know ahead of time that individuals might have different factors than their species would indicate, though this is uncommon and almost always along a single factor of alignment. Blood mages are strictly ordered to work only within a single factor of misalignment, which reduces the risk of an adverse reaction considerably.

There were a lot of things that the book didn’t say. It did not, for example, say what the side effects were, it didn’t say how factors of alignment changed in someone of mixed species, and it didn’t say what, if anything, caused a person to have an alignment that was “off” from their species. It didn’t define the five factors, or how you’d go about figuring those out. I would have thrown the book across the room, but I had always loved and respected books, even if they were nearly fucking worthless pieces of propaganda garbage.

I watched Fenn, with her shallow breathing, too-pale skin, and her nearly white lips. I could feel that familiar feeling of helplessness welling up in me, one that had started when I was watching Arthur in his coma, but which had stayed with me for a long time. I wiped away the nascent tears and turned my mind to what was actually actionable, what concrete thing I could do that would make my life better, even if the situation itself was hopeless, that had always helped in the past -- and here, there was definitely something that I could do.

I started by dumping the two points from leveling into MEN. I was pretty sure my read on the game giving me “fake” intelligence was right, but whether it was fake or not didn’t matter so long as it gave me results. I felt a touch calmer once that was done, though not nearly as much as I had hoped I’d get from increased WIS. Then it was time to turn my mind to the problem.

There were five factors of blood alignment. People of the same species were assumed to be compatible with each other, with deviation along a single factor being ‘uncommon’ but not rare. If Fenn and I were both human, then no problem, we might have unnamed side effects that were almost certainly better than what she was going through now, but I’d be willing to risk that, especially given Solace’s prognosis. But Fenn was a half-elf, which meant that the worst case scenario was that 1) she got all five factors of alignment from her father, and that 2) all five of those were the opposite of whatever mine were as a typical human, and that 3) trying to push my blood into her would have fatal results. That was a lot of assumptions, but it was a starting place.

So far as I could see, the five factors were treated as binary in their letter designations, which meant that there were two to the fifth possible combinations, or thirty-two. Blood mages were ordered to work within a single factor of misalignment, because that made two factors of misalignment ‘uncommon’, and presumably it wasn’t ‘uncommon’ for a blood mage to kill someone through transfusion, which meant that was the zone of safety, or maybe just the zone of not making things worse for Fenn. If blood types were purely random, then I’d get a pure success one time out of thirty-two, within normal bounds five times, and unnamed side effects another ten times.

But it wasn’t purely random, it was determined by species, or at least, different species had different
variances and mostly fell along one side of each factor, enough that this was a useful tool that was routinely used by blood mage healers. For Fenn there were two species in play, and the blood type of elves was a mystery to me, but I could at least assign confidence to all of the possibilities that I could think of. I spent five minutes doing that, trying to stop myself from taking Fenn’s pulse again, and mostly succeeding on actually deciding whether it made sense to try to give her a transfusion.

And in the end, I decided to go for it. I wasn’t confident in my confidence, but I was at least confident that I wasn’t doing it because doing something felt better than sitting by and doing nothing. I got the clonal kit to give me transfusion equipment, which looked horribly unsanitary and archaic to me. The needles were thick metal ones, looking far too wide for my tastes, and Aerb didn’t have proper plastics, so the tubing was a thick, yellowish rubber. The sum total of my experience with blood transfusion was watching TV shows, and having given blood once in the high school gym. I was praying for my mental stats to help me (though not actually literally praying, because the closest thing I had to a god was the Dungeon Master, and this was mostly his fault).

I inserted the needle into a vein in my arm, which filled the rubber tube almost immediately, visible as a darkening in the yellow rubber. The other end was connected to another needle, and I tried to raise it in order to reduce the pressure and slow the flow of my blood from the end of it before realizing that I was no mere mortal, I was a blood mage, and if I didn’t want my blood to go down a tube, I could damned well just tell it not to. (This actually took me a little bit of time to figure out how to do.) Once that was accomplished, I found a vein in the back of Fenn’s hand, and paid special attention to the tip of the needle to make sure that I wasn’t going to inject her with air and give her an embolism.

And then, once the needle was in her, I really did say a prayer, because I decided that probably wasn’t going to make things worse.

_O One True God of Aerb, master of not just the physical layer, or the game layer above that, but of the reality both are embedded in … we’ve got to stop meeting like this, right? I’m not going to come to you with all my problems, or even most of my problems, but -- please don’t let her die. If you’re rolling dice, or some equivalent of that, fudge it for me just this once. You know I won’t be able to tell one way or another. Amen._

Only then did I let my blood flow into her.

(This was how Arthur had died. He’d had his car accident and ended up in a coma. ‘Cerebral edema’ was what they called it when there was too much fluid in your brain, and that was Arthur’s most pressing problem, as the days in a coma went on. His brain was swelling, and if your brain swells too much, there are issues from compression, and then you die. The doctors decided that they were going to go with decompressive craniectomy, which means removing part of the skull so that the brain can expand without squishing itself. The doctors -- look, I don’t actually know any of this, I wasn’t in the room when they were deciding it, and most of this I only learned because of morbid curiosity after the fact -- they must have seen the swelling in his brain and made a list of all the interventions that they could try, weighing the risks and outcomes, and finally they had settled on the craniectomy, and maybe, sometimes, you made the right choice given the information that you had, but the dice just weren’t in your favor. They did their decompressive craniectomy, and that was how Arthur died.)

I could feel my blood, sense it like I somehow had nerve cells floating around in there feeding me back information. I sensed my blood enter Fenn’s body and mingle with her own, racing down her veins toward her heart. It wasn’t long before I had a sense of her as a part of me.

*Spell discovered: Bloodline!*
Bloodline: When you have forced your blood into another person, you can use it to heal or harm them. Apply a bonus or malus of up to your POW/SPD/END to them, at the cost of your own, with five factor modifiers.

The new “spell” was pointless for the current circumstances. What she needed was the actual blood itself, not the game abilities, which I had already given her through bone magic. Still, I dutifully read the information the game gave me, and I could feel the ability to use that new skill. She was like a part of me now, because my blood suffused her, and I could see all the other avenues of this link that the game hadn’t told me about, how I could channel the blood magic through her to light her fingertips up like I could light my own, or how I could use her pulse in combination with my own to add force to her movements, if she had any movements to speak of.

I watched her closely, but she wasn’t showing any obvious signs of an adverse reaction. I had the Hypertension virtue, which gave me twice as much blood at a much greater blood pressure, so I wasn’t worried about myself. I did wonder how much of this might have been planned out, how meaningful it was that it had only been a few days since I had gotten the virtue, and less than an hour since my blood was refilled by a level up. I tried not to think about whether that was by coincidence, luck, principles of design, or a thumb on the scale. Instead, I watched Fenn.

The color returned to her lips, then to her skin, shifting from near-white to the pale pink that it had always been. I kept feeding blood into her until I was down forty-thousand drops, because hypertension wasn’t just a virtue, it was an actual medical condition too, with negative side effects I didn’t really know anything about, and which I didn't want to give her on accident. I pinched the rubber tube and felt for her pulse, which was faster now, almost normal, and with a steady rhythm. I pulled the needle from her arm and used another bone to push END into her, sealing the puncture shut, then took care of myself in the same way.

She wasn’t dying. I let out a slow, shaky breath. I wasn’t sure that she was better, not yet, and I had no idea what the long-term effects of losing half your blood were, but … she wasn’t dying. She was alive. I started crying, just a little bit, that kind of crying that results in some slow tears rolling down my cheeks.

Her eyes fluttered open, and I stared at her. She looked around in confusion, first at me, then down at her ruined armor, then at the tree-house we were in and the light streaming in from the artificial sun outside. She lifted her head up for a moment to look further, down at the red line running across her skin, then flopped back down.

“Dammit,” she said, looking up at the ceiling, avoiding my eyes. It was a while before she spoke. “I had this pun ready about how I’m not half the woman I used to be, but now I have to think of something else.”

“Fenn,” I said. My voice nearly cracked. “Are you … how are you feeling?”

“Oh, you know,” she said, still not looking at me. “Not half bad.”

“Fenn,” I said again.

She finally looked at me, with tears in her eyes. “Please,” she said. “Can we not talk about it? Can we just --” She reached a shaky hand up to wipe tears from her eyes and took a gasping breath that was just short of a sob.

She had lost her battle. She had come as close to death as it was possible to get; she’d probably been clinically dead by Earth standards. What had she seen, when that sword had cut straight through her? How long had she stayed conscious after that? Had she known, in that moment, that she was at
death’s door, had she seen half her body laying on the ground and been unable to feel it, or had she just been consumed with shock and pain? It must have been horrifying, no matter what her experience of it.

“Do you use your right hand to stir coffee?” I asked.

Fenn looked at me in bewilderment, then down at her hand. “I -- I guess?”

“Oh,” I replied. “I use a spoon.”

Fenn stared at me, opened her mouth slightly, then cracked a teary-eyed smile. “Gods Juniper, I don’t know what would be sadder, if that was the best joke you had from Earth, or if you came up with that on your own.” She started laughing then, still with tears in her eyes, and sat up to pull me closer. “Hug,” she said, so I hugged her. My sense of blood was fading with every passing minute, but she still had more of my blood than her own, and it was like I could feel the shape of her just by noticing that sixth sense.

“Okay,” she said, after we had held each other for a while. She pulled away and swung her legs off the bed-nook, then stood up, wobbling only slightly. She began to strip off the armor, which I had to think was a total loss, and the cut had gone through pretty much everything that she was wearing, which meant all her clothes beneath it too. I averted my eyes, because it didn’t seem like she was trying to put on a show for me, it just seemed like she didn’t want to be in this reminder of what had happened to her. She made no comment on the fact that I wasn’t looking at her.

“Where’s Sable?” she asked.

“Amaryllis has it,” I replied.

“That sneaky bitch,” Fenn replied with a grin. “Taking advantage of my brief nap to use the best magic item the party has, that’s just like her.” She kept her tone light and casual. “She’s okay then?” With the last of her clothes off, underwear included, she sat back down in the bed and crossed her legs. “I have no clothes,” she said.

“I noticed,” I replied. “Here.” I began taking off my armor, stopping only momentarily to look at the pure-white mark where it had entirely absorbed the fireball. When the top half of it was removed, I took off my undershirt and handed it to Fenn. I couldn’t help but get a warm glow at the way her look lingered on my abs (a perk of my high PHY).

She stopped to give it a quick sniff before putting it on. “Well now I’m going to smell like you,” she said. “But thank you.” She hesitated slightly. “And Grak is okay too?”

“Everyone is fine,” I replied, realizing that I hadn’t given her an after-action report, and if someone had done that to me, I would have assumed they were holding back bad news. “Solace is tapped completely dry, so we’re going to have to wait on her to recharge before we can leave the bottle. I healed Grak enough that he told me to stop worrying. Amaryllis came through a bit battered but still in fighting shape. Larkspur is dead, along with everyone he brought with him. More than that, I don’t know. Grak and Amaryllis have the bottle, I came in here to save you.”

“Ah,” she said. “Save me?”

“Do you want to hear this?” I asked.

“If it’s about you heroically saving me, then yes,” said Fenn.

“Solace did most of the work,” I said. “After you were … after what happened to you, she brought
you here and put you back together before you died.” Or, possibly, after you had died. On Earth,
you weren’t dead until you were warm and dead, but on Aerb, it probably moved beyond that.
Maybe you weren’t actually dead until your soul left your body. “You had lost too much blood
though, and if you don’t have enough blood to move oxygen around, or to keep blood pressure, then
your heart and brain will start to fail. You were back in one piece again, but you needed blood, so I
gave you some of mine.”

“You know how to do that?” asked Fenn with a raised eyebrow.

“Not really,” I said. “It seems like it worked though.”

“Seems like it,” she replied. She looked down at her hands and flexed them, tightening them into
fists. “It’s very … intimate.” She traced a finger along the arteries in her wrist and shivered slightly.
“Elves --” she began, then stopped. “I told you about the cannibalism thing?”

“Yeah,” I replied, watching her.

“It’s an insult,” she said. She was still a little bit shaky, still not back to her normal self. “Usually.”
She closed her eyes and tapped at her neck. “But when two elves get married, there’s this part of it
where they stick a finger in each other’s mouth, usually the thumb, and they both bite down hard
enough to draw blood. It’s difficult to explain.” She touched her slender hands to her throat, using
her fingers to feel at her pulse. “I mean, not hard to explain what they do, but just, the weight of it.
Elves have this obsession with consumption. The average meal is a bunch of elaborate, delicately
prepared pieces of raw meat, perfect in every way. The day is centered around eating, divided and
marked by it. For an elf, it’s about being better than the thing the meat came from. Eating is a way of
saying ‘fuck you boar, I’m better than you’. It’s affirmational. In the context of marriage, it’s a
husband saying to his wife, ‘I’m so much less than you that I would give of my body, unasked, to
allow it to sustain you’, and his bride answering the same in return.”

“So, we’re basically elf-married now, is that it?” I asked. For some reason I found that unimaginably
funny, maybe because it was so incredibly hackneyed.

“No,” said Fenn. She was still touching her throat and hadn’t opened her eyes. “I’m just saying that
you filling me with your blood is very intimate.” She opened her eyes and looked at me. “It’s not a
sex thing, if that’s what you’re thinking.”

“But it is a romance thing?” I asked.

“Sort of,” said Fenn. “Elf marriage isn’t really about romance.” She shook her head, and I could feel,
distantly, the movement of my blood within her. “I don’t know, I’m explaining it shitty, I was never
very good at being an elf.”

“I get it,” I said. “It was meaningful to you in a way that I didn’t understand, and you wanted to
share that with me, so I would know what you were feeling. If we’re going to be … maybe it’s not
the right time for that, to talk about that, I mean.”

“No,” said Fenn. “I’m still a little fucked up from the old half-and-half.” She traced a diagonal line
across herself. It was maybe the least convincing display of light-heartedness I’d ever seen from her.
“I wouldn’t mind someone in bed with me, so long as we only talked about, oh, I don’t know, small,
fluffy animals or something like that. Or maybe stories of Earth, if you’d prefer.”

So I took off the rest of my armor and crawled into the bed nook with her, in just the thin pants I
wore under the greaves and cuisses. She scooted aside for me, then shifted herself so her head was
on my bare chest and her body was curled next to mine.
“Go on,” she said. I felt her warm breath on my chest. “Tell me a story of Earth. One I wouldn’t have heard before, none of the Penndraig ones. And please, please nothing about Dungeons & Dragons.”

I moved my arm so it was around her, and rested my hand on her back, which I rubbed with gentle motions when she pushed back against me. “Um,” I said, trying to think. “We used to have picnics -- do you have picnics on Aerb?” Fenn shook her head. “A picnic is basically, you make most of a meal at home and then eat it somewhere outdoors, usually in a park. When I was little, we had our picnics at a place called Miller’s Pond, which had a little park next to it. Dad would make German potato salad, which has bacon in it, and mom would make cucumber salad, and then we’d get these pre-seasoned chicken breasts from the grocery store that he would cook up on the grill. I always used that time to feed the ducks, or go fishing, while mom and dad spent their time chatting.”

This was before they started fighting so much, which was more or less when family picnics in the summer ended. I wasn’t about to tell that to Fenn though, not when she needed comfort.

“I decided that I wanted to fish. Miller’s Pond was stocked with fish by the city, and you had to throw them back if you caught them, so it wasn’t really sporting, but I kind of liked having that time to sit and think on my own. On the day in question, I’d taken off my shoes and socks to fish while standing in the water, because I wanted to feel the mud between my feet. I was pretty young.” My fingers traced the contours of her shoulderblades. “I’d been standing there in the water, pruning up, for about ten minutes when I saw a duck swimming by with one of my socks.”

“A duck?” asked Fenn.

“One of the ducks from the pond,” I said.

“No, I mean what’s a duck?” she asked. “Is that an Airth thing?”

“Fenn, you know what a duck is,” I replied.

“Ah shit, you got me this time,” she said. I could hear the smile on her voice. “So this duck got your sock?”

“Yeah,” I continued. “And he was swimming away with it, so I dropped my pole and went running after him, but if you’ve ever run after a waterfowl in its natural environment, you can guess how that went. I ended up falling down in the water and getting myself completely drenched. The duck decided that the sock wasn’t actually food and dropped it in the pond, so since I was already wet I started swimming, hoping that I could get to my sock before it just sank down into the mud and was lost forever. And I did manage to recover my sock, but when I started my way back to shore I saw that my dad had my other sock, and he was walking around doing his best impression of a duck trying to steal it, and my mom was laughing her ass off over by the picnic table.”

I took me some time to realize that Fenn had fallen asleep, which was fine by me.

(Solace came up from the basement, rubbing her neck, a few hours later. She looked at the two of us, gave us a knowing smile, and then slipped out from the house. The doe popped its head in through the window a little later on, and gave its own snort of breath at us, which I didn’t know how to interpret. I eventually fell asleep myself, and for once had pleasant dreams.)
“Well, that was fast,” said Amaryllis. I snapped awake and stared at her, standing over us, and realized that I was in bed with Fenn next to me (wearing no pants), resting her head on my chest. Amaryllis was still in her plate, looking tired but pleased with herself. I think ‘wry amusement’ just about covers the way she was looking at us.

“It’s not what you think,” I said, not making a move to get up. “Unless what you think is that I gave her a transfusion and then we took a nap together.”

“He really filled me up,” said Fenn, who rose and stretched. She turned back to look at me and smiled, and I couldn’t help but very briefly glance down at her naked butt. “Pervert!” she screamed, and leapt from the bed, covering her privates with one hand. She wasn’t even attempting to hide her smile. “Mary, you saw, he looked at my butt.”

Amaryllis held out her right hand, where she was wearing Sable, and materialized a pair of underwear, which Fenn swiftly took from her.

“Also the glove,” said Fenn as she slipped into the underwear. “A woman isn’t decent until her hand is covered by a magical glove with infinitely expansive extradimensional space.”

Amaryllis took off the glove and handed it to her, which Fenn took and put on with a look of utter triumph that turned to momentary confusion and then, quickly after that, a scowl. “Sorry, I should have specified that the glove be invested,” said Fenn.

“I have one condition,” said Amaryllis. “No more shirts.”

“Done,” said Fenn, far too quickly, and with too much of a smile on her face.

“No more shirts with writing,” said Amaryllis. “I still want shirts.”

“Okay, done,” said Fenn, again too quickly.

“Fenn,” said Amaryllis. “Do you think I find this funny?”

“You laughed that one time,” said Fenn, “And it’s fucking hilarious, so I don’t know, you tell me, do you think that I don’t think you find it funny?”

“That wasn’t a genuine laugh,” said Amaryllis with a not-quite stony face.

“Liar,” said Fenn. “And anyway, I agree to your terms, and like a true friend, I agreed to your amended terms, but everyone knows that even a true friend wouldn’t allow a second amendment to an oral contract.”

Amaryllis sighed, then touched Sable briefly, after which a Fenn’s smile widened. She hugged the glove to her chest, then gave it a kiss.

“I touched corpses with that,” said Amaryllis.

“I’ve touched corpses with it too,” said Fenn. “Any good loot?”

“No,” replied Amaryllis. “All of it was bound to Larkspur, now it will be bound to a different cousin. It’s good to have, and good to deprive them of, or possibly use in trade, but there’s nothing that we can actually use.”
“Are we still in the forest?” I asked. “What about the helicopter?”

“I took everything there was to take,” said Amaryllis. “All of the souls of the dead are in a bottle. As soon as the teleportation key allowed us to, I moved us. We’re on the foothills of the World Spine right now, and we should be miles away from anyone, which is the only thing that this place has to recommend it.”

“But I know how to fly a helicopter,” I said. Ish.

Amaryllis stared at me. “How were you proposing that we transport it?” she asked.

I opened my mouth at that, then closed it, because I actually had no idea, aside from ‘use bullshit druidic magic to get it into the bottle’. It was possible that we could take the helicopter apart and put the pieces into Sable, but that would have been a mammoth task for just two people. And we could go back for it, but I could already see all the objections piling up on that front, which were all the same reasons that we hadn’t gone back to the castle in Silmar City. And even if I could navigate my way around those objections, what the fuck were we going to actually do with a helicopter, magic or otherwise? (But it was obvious to me that if the Dungeon Master had a single dramatic bone in his body, I would fly a helicopter at some point, especially because this marked the second time that I had come close to a helicopter and then not been allowed to fly it.)

“Not everything is a clue,” said Fenn with pursed lips.

“But some things are definitely clues,” I said. “Some things have cosmic significance, for lack of a better word. And helicopters are one of them. They’re part of my backstory, again, for lack of a better word. I’m not saying that everything is going to have meaning in one way or another, I’m just saying that this probably is a clue, and if we don’t go back for the magic helicopter, or we can’t take it with us, then we should at least be on the lookout for other helicopters. Really, we should just go there and use bulk teleport to put it somewhere that we can get it again, if we need it. For both the helicopters, actually.”

“Even if we had the incantation --” Amaryllis began. A stack of papers appeared in Fenn’s hand. Amaryllis stared daggers at her. “Even if we had the necessary supplies --” Fenn tossed the papers onto the bed beside me and produced a small basket from the glove with a flourish. “Did you steal those?” asked Amaryllis.

“Stealing is such a strong word,” said Fenn. “It’s not incorrect, I’m just pointing out what a strong, brave woman I am.” She coughed politely into one hand. “You can, ah, ignore any stories about me getting bisected as obvious fabrications.”

Solace and Grak came into the main room of the house then, leaving it feeling slightly cramped. Grak gave me a low bow, and Solace gave me a happy smile.

“Can I ask who’s watching the bottle?” I asked.

“I put up what wards I could,” said Grak. “I need a week of rest if you want me to be useful on that front.”

“Are we safe?” I asked.

“No,” said Grak. “We won’t be safe until our enemies are dead.”

“He’s exaggerating,” said Solace.

“The primary worry, at this point, is that either Hyacinth or Doris will continue what Larkspur
started,” said Amaryllis. “I don’t think either is very likely. It’s hard to parse what Hyacinth’s incentives are without a clear picture of what’s going on within Anglecynn, but from what we know she was done dealing with Doris, and she already thought Larkspur had spent too much time and effort on the project. We’ve added revenge to her incentives, but I don’t think that will change much. We still have to worry about her in the long run, but she’s not the Foreign Security Director, which means that she has considerably fewer levers to pull. I’m not entirely sure what her story is going to be about what happened to him, especially since we have the body, not them, but I really, really doubt that we’re in danger from her right now.”

Amaryllis shifted slightly, reaching to scratch at her neck where the armor met it. “Doris Finch can’t leave the exclusion zone. She has agents, but they’re not very good, because she doesn’t trust other people, not even herself. My guess is that she knows that we have a teleportation key, either based on her deal with Larkspur or just from watching the reported probability of our movements. She’s dangerous, but in a different, more unpredictable way. I still think we’re safe here.”

She cracked her knuckles. “And that leaves everyone else. We don’t actually know how many people know that we have the key. The set of people who want me dead is very small, limited only to a select set of my cousins. No one else within this group has enemies that are a threat on the level we operate at. So from my way of thinking, our primary concern is whether or not there’s an intra-imperial alert out for us, and that, at least, is something that we can find out in relatively short order with little risk, because doing those things subtly is next to impossible.”

“So we rest here for a week, or rest while testing whether anyone is in pursuit, or rest while moving around?” I asked. “Then we can go back to Boastre Vino under disguise and see whether there’s a BOLO out for us?”

“A BOLO?” asked Amaryllis.

“Sorry, Earth slang, ‘be on the lookout’, ” I said.

“‘Whether there’s a be on the lookout out for us?’” asked Grak. “Does that parse properly?”

“No,” said Amaryllis. “It doesn’t matter. Are we agreed on resting for now?”

There was a round of assent at that. We’d all been through not-insignificant amounts of hell over the last few weeks, so it wasn’t particularly surprising that we would vote for a break. I remembered thinking, back when I was shooting at cans in the Risen Lands, that MMA fighters had about four ten-minute fights every year, spaced pretty evenly. In the past week, I’d had four fights to the death, with very little time to process it or do anything but move forward. I wasn’t exactly in the same position as someone who did blood sports as entertainment, and I didn’t need nearly the recovery time before I was good to go again. Still, it was a lot, and probably more for everyone else than it was for me.

Having real, actual time off was amazing. I’d had times on Aerb that kind of, sort of, if you squinted at it sideways, approached time off, but most of that was spent on training. That wasn’t to say that I was planning on just abandoning training altogether for a whole week, but the game had sort of given me an excuse; I couldn’t go past 20 in a skill without either being in actual danger or having a good teacher. Given that we had given ourselves a week, I expected I would be able to hit that cap without having to devote all my hours training.

After we’d all had food, a communal dip in the stream, and a change of clothes, Solace and the Six-Eyed Doe gave us a tour of the bottle. It was only a square mile, but that meant about three and a half miles of walking the perimeter, and another few miles of going down the trails, all at a rather sedate
pace necessitated by the fact that there were no proper roads and numerous elevation changes. We split into groups, somewhat organically, in part because the deer trails required us to move single-file. Grak took great interest in the wards, some of which were apparently necessary for the (mostly) closed system, and Solace indulged him. Fenn, after whispering in the Six-Eyed Doe’s ear, was treated to a ride, which took her far from the rest of us as the locus stretched its long legs and went for a run. And that left Amaryllis and I, staying back somewhat.

“It doesn’t bother me,” said Amaryllis, apropos of nothing. “You and Fenn.”

I could feel myself tense slightly at that, mostly because I didn’t know how much she was telling the truth, or what her motivation was for saying that. For all that I was giving her a second chance, I felt like I was perpetually off my footing when talking to her.

“I’m glad you’re not bothered,” I replied. “I mean, I’m glad that it’s not going to be a source of tension, or anything, not that it would be.”

“I bring it up because I don’t know what I said while under the influence of the unicorn blood,” said Amaryllis. “Fenn and Grak apparently made a pact between them not to tell us, but I’ve been worried that it’s going to come out at the exact wrong time, so I’d like to be forthright in the interests of not having complications that we can’t afford.”

“Oh,” I said. “I see. And there are things that you might have said that might lead me to believe that you were bothered by our very-much-unofficial-but-probably-not-for-long, ish, thing.”

“You can simply say that you’re courting,” said Amaryllis.

“Yeah,” I said.

We kept walking in silence for a minute. Amaryllis was more relaxed now than she’d been since I’d met her, which, admittedly, was probably a high point for stress in both our lives. She had taken off the armor and was going around in an unadorned blue t-shirt and shorts, with sneakers on her feet. She probably would have been able to pass as a student at my high school, if she’d been dropped there in some kind of reverse portal fantasy. There were details that would give her away to anyone looking closely, like the blend of textiles in her clothes, or the lack of plastic anywhere on her person, or the brands, but it was very close. She’d draw stares, because she was breathtakingly, heart-stoppingly, beautiful, but that aside, it was eerie how close to home she could make me feel.

“You grew more handsome with every point you put into your physical attributes,” said Amaryllis. This, I could tell, was a rehearsed line. “I didn’t feel anything like attraction to you when we first met, and I could tell that you felt some attraction to me, so I decided that I would keep that option open.” She was walking ahead of me through the tall grass, and she turned back toward me, maybe to see whether I was listening. “I’m a Princess of Anglecynn, marriage and progeny are part of our stock and trade. I never imagined that I would have the luxury of marrying for love anyway. With your ability, if it was as powerful as I had imagined, if you were Uther reborn, you were as good a match as any I was likely to find. Maybe if I were more driven or more callous I would have pressed that advantage. Maybe … maybe I am that callous, I just doubted my ability to actually pull it off, when push came to shove. I don’t have experience with men. I don’t have that natural spark that Fenn does either, that raw sensuality, the way she can effortlessly draw the eye.”

I listened to this carefully, trying not to feel too bowled over by what she was saying. The last thing I had ever expected her to admit was a feeling of inferiority toward Fenn. That she wasn’t attracted to me wasn’t a surprise, but it did still sting. Was I supposed to apologize for my attraction to her, an attraction that I still felt? I couldn’t actually help that, but I would have apologized for being that way if it made any difference.
“You understand why I’m telling you this?” asked Amaryllis. “Some things it’s better to do quickly and thoroughly.”

“Like ripping off a band-aid,” I said, aware that the idiom probably wouldn’t translate. “Was there more?”

“Yes,” she said, letting out a breath. “I decided, at a certain point, that there was something legitimately attractive about you. Not in terms of personal aesthetics, though there was that too, but …” She sucked in a breath. “I don’t know what I said while I was feeling the effects of the unicorn blood,” she said. “So I’m going to say the worst things that I might have said, because right now we have time to get past them. I don’t want us to have another falling out because we didn’t talk about things that are painful or awkward to talk about.”

I could feel a tightness in my chest. “Can we stop and sit somewhere?” I asked. “I don’t like not being able to see your face when you talk.”

“Sure,” she said. She hailed the others, who were engrossed in their own conversation, and they waved to us as we hooked to the left and found a large rock to sit on together. Amaryllis had a solemn face, and hugged her knees. She spoke into the air instead of looking at me. Maybe it was easier for her that way.

She reached up, as if to brush a strand of hair back, but stopped and touched her short hair. “I thought that I would be your love interest, if you started to grow beyond my ability to contribute,” she said. “Uther had his Knights, but he had a wife as well, and Zona had more power than any of them, in all the ways that mattered. All the focus gets placed on Uther, but she’s the ancestor of every Prince and Princess of Anglecynn just like he is. She shaped the future of Anglecynn in her own ways.”

I had set the biography of Uther Penndraig aside before getting to the part where he met her, but I obviously knew that he’d had a wife. It weirded me out to think about Arthur in his twenties, married with children. Maybe I was at a point in my life where that was harder to wrap my head around than the fact that he’d built an empire that had spread across the world.

“So I thought I would be that to you,” said Amaryllis. “If you tried to kiss me, I would kiss you back, and if you wanted to fuck me, then I would --” she looked to me, “Endure it,” she finished, apparently not pulling any punches. “I would get through this thing that I didn’t want to do, and I would learn to like it, or at least learn to not visibly dislike it.” She folded her hands in her lap. “I’m aware of how that makes me sound,” she said.

“Kind of makes me feel like crap,” I said. That wasn’t the half of it. It wasn’t her saying she didn’t want to have sex with me, it was the idea that she would still her instinctual response of recoiling from me. That made my heart drop, not because of what it said about our personal relationship, or just our friendship, but what it said about her.

“I thought it might,” said Amaryllis with a small nod. “I’m not done yet, sorry.” She let out a sigh and hugged her knees closer, still not looking my way. “It was while we were making our way through the Datura that I started to see something in you. There was a glimmer of a real spark when I looked at you, so I did what I thought made the most sense given the circumstances, and I set that spark in kindling, then blew on it to start the fire going.” She paused. “Did I misread your attraction to me?”

My heart was hammering in my chest. “No,” I said, almost choking on the word. “You have to know that I would never have done anything if I thought that there was any chance you didn’t want it.”
“I know,” nodded Amaryllis with a soft smile. “That made it easier to kindle the flame. I fantasized about what it would be like to kiss you, or to have you hold me. I tried to imagine what it would be like to have you take my virginity, and I tried to imagine sex with you as this positive thing that I wanted with all my heart.”

“Did it work?” I asked. (I was trying to be careful with my words, but this was not a conversation that I was cut out for.)

Amaryllis was silent. Then she looked over at me. “A bit,” she said. She pursed her lips. “I don’t know how I would have put it, when I had the unicorn blood in me. My phrasing then might have been stronger. I think that what I managed to make myself feel for you is probably just a fraction of what you and Fenn feel for each other.”

“Ah,” I said, swallowing hard. “I’m glad it didn’t work all the way. Because … Fenn.”

“Yes,” Amaryllis nodded. “I’m working on snuffing out the small fire I had going. I was serious, when I said that it didn’t bother me. She suits you better than I ever would have. You’ll be good together. Probably annoying too, but that’s Fenn. I care about both of you, and it makes me pleased to see you finding happiness in each other.” She hesitated. “I think about alternate presents, and other paths that we might have taken. There’s a sense of loss that I’m trying to shake, like a unicorn’s vision of a past that was lived but never actually happened. I don’t wish that you and Fenn were apart, and I don’t wish that I was with you, but I do think about this other version of me that was more ready to trust, more craving of a man’s touch, warmer and kinder. If I were someone fun, like her.” She bit her lip, hard enough that she winced. “I’m sorry, this isn’t helpful, I’ve said all the things I meant to say to inoculate us against this in the future. I probably shouldn’t say more.”

“Do I need to reciprocate?” I asked. “Do I need to tell you ... things?” (God knows what I said about Amaryllis when I was on unicorn blood, but it apparently wasn’t enough to stop Fenn.)

Amaryllis gave me a small, hollow laugh. “You’re very transparent, Juniper,” she replied. “No, I already know the gist of it. I don’t think there’s anything that I would worry about being blindsided with, in some future argument.”

“Okay,” I said, breathing a sigh of relief. “Should we go join the others?”

“Give me a second,” said Amaryllis. “I’d like a little time alone.”

I left her on the rock and started down the trail again. Grak and Solace were sitting together a ways away, where the tall woods started, just before the run-up to the side of the bottle. From the looks of it, she was telling him a story, with large hand gestures and the occasional flash of color from her hands.

I wasn’t sure how to feel about Amaryllis and the things she’d told me. On the one hand, I felt like I had dodged a bullet there, because she was suited exactly to my tastes in so many ways. Maybe if we had more time for a slow burn, or if Fenn weren’t there, I would have ended up with her, courting this girl who was trying her hardest not to feel distaste when I kissed her. On the other hand, I felt this irrational need to fix her somehow, to hold her and comfort her until she was defrosted and capable of, I don’t know, experiencing actual romantic love and the joys of sex. I knew that if Tiff had heard me say something like that, she probably would have talked my ear off about how that was a deranged male fantasy that didn't even remotely map to the real world, but it was what I felt all the same. Mostly though, it all just made me sad. No wonder her loyalty had gone up when I’d told her that she was never going to lag far behind me in power.

Fenn came up alongside me, riding the Six-Eyed Doe, as I was lost in thoughts of parallel timelines
and might-have-beens. “I found this funny-looking deer,” she said. The locus bucked below her, hard enough that she had to grip it tight, and Fenn laughed at the struggle until finally the locus went still again. “Good chat with the princess?”

“Yeah,” I said.

“Care to tell your Fenn what about?” asked Fenn with a thrum of her fingers on the doe’s flank.

“It’s complicated. Unicorn stuff,” I said. “I’m hoping that you already know all of it, so we don’t have to have this awkward, stressful conversation about it.”

“Ah,” said Fenn. “And you’re in a mood about whatever she told you?”

“A bit,” I nodded.

“Could you tell me what sort of mood, precisely?” asked Fenn. “I am, naturally, a strong, self-assured woman who doesn’t need her almost-boyfriend to tell her that their fledgling relationship is still intact, but maybe you should go through the motions, just to get some practice, in case you ever do date someone that pointlessly needy and insecure.”

“Fenn, I know that this might seem like it’s coming out of nowhere, but would you like to go on a date sometime?” I asked.

Fenn hopped down off the doe with an acrobatic twist and landed beside me. She was giving me the widest smile I’d ever seen from her. “Well,” she said. “This is very unexpected.” She stepped closer to me, within the zone of intimacy. “Obviously I’d have to think about it.”

One of the changes that had happened to my body was that I had grown taller. Fenn and I had started out about the same height, but now I had about two inches on her, which meant that if she wanted to kiss me, she would have to tilt her head up just slightly. She was doing that, obviously so, and she left her lips slightly parted when she finished speaking. I shouldn’t have felt so unsure of myself; I knew how she felt, I knew how I felt, and yet I had this nervous, trembling energy as I moved forward and kissed her, fear and adrenaline coursing through me like maybe, somehow, I had misread her.

She melted into me, pressing her body against mine, sliding a hand up to touch me on the back of my neck, with her fingers in my hair, and I pulled her closer against me as we kissed, like I thought I’d be able to merge us into a single being. I was surprised by my urgent need for her, and she for me, but that surprise was eventually washed away by the pure sensation of her soft lips against mine.

When she pulled away she was breathing heavily and shaking slightly, her freckled cheeks red. She stared into my eyes and ran her tongue between her lips, savoring the aftertaste of our kiss. “Okay,” she said. She shivered slightly, and her hands clung to my waist. “I’ve given it some thought. One date, and we’ll see where it goes from there.”

END BOOK III
“Vervain was far from the first flower mage, but he was the best there ever was,” said Solace.

The glass bottle that contained the locus’ domain didn’t have anything so neat and ordered as a garden would imply, but there was a small section that was devoted to Solace’s side business as a flower mage. In a proper garden, you laid everything out in clean, ordered rows, clearing away the weeds, grass, and everything that wasn’t a cultivated plant. In Solace’s unstructured growing space (okay, fine, garden) it was hard to tell which plants were supposed to be there and which ones weren’t. I couldn’t see terribly many flowers, though some of the plants definitely didn’t look like they belonged; long red vines with sharp brown ridges, a low green plant with blue-edged leaves that spread out to cover a whole square yard of space, and a tree whose trunk was a vivid purple where there were cracks in its thick black bark.

“A flower mage usually has a few carefully cultivated strains,” Solace continued. She spoke calmly and walked among the garden as we talked, touching plants as she went and sometimes looking them over, gently turning a leaf this way or that. “I have eight. Vervain was said to have twelve thousand. He supposedly had no grand secret, he was simply very good at what he did. He traveled widely and spread his seeds in the perfect places, leaving his plants untended, and he had a knack for coming back to find the buds just before the bloom.”

This … was not exactly the foundational education in flower magic that I had hoped for, when I had asked her if she could teach me what she knew. It felt like if I’d asked someone how to program a computer and they’d started me off on a lecture about Alan Turing.

“I mean, it does sound like he had some kind of secret,” I said. “Predictive magic or something like that?”

“Possibly,” said Solace with a nod. She moved beneath a tree, and the dappled light from the artificial sun overhead played across her light green skin. “I’m sure that people have theories, I’m just repeating what I was told.”

“He was a hundred years before your time?” I asked.

“Yes,” nodded Solace. “He casts a shadow over every flower mage before or since. He was prolific in a way that no one else has ever been. In a word, he was special, and you need to understand that going in.”

“Huh,” I said. “You know, I actually know basically nothing about flower magic, and Vervain is just some guy I read about in a history book, so … if you’re trying to tell me that I’m never going to reach his heights, and I shouldn’t be going down this path without expecting a long, frustrating slog, point taken. But also, you should know that I’m exceptional, and if anyone can do whatever it was Vervain did, it’s me.”

Solace grinned at me. “I wouldn’t have figured you for the cocky type,” she said.

“At this point, I think it’s a realistic assessment of my abilities,” I replied. Not to mention the fact that this entire world very much appears to have been built for me, which we don’t talk about in polite company.

“Ugh,” I said. “I hate that series.”

(When I was rich and famous … well, I was already rich, considering that we as a group had something like twenty million obols worth of gold, magic items, and things Fenn had stolen. But when I was really rich, and could move around without worrying about the international community putting out a warrant for my arrest because of all the people I’d (probably justifiably) killed, I was going to publish my own book series, with titles like Flower Magic: A User’s Manual, and they would tell you how to actually do magic, in concise terms, without personal stories, anecdotes, or blatant propaganda about how great magic users were. And then the athenaeums would start gunning for me, because they were the ones that ensured we had the craptastic Commoner’s Guide in the first place.)

“Amaryllis said, basically, that flower mages carry small buds around with them, and each is a different spell, whose effects are as good as impossible to predict unless you have a lot of time to scope them out,” I said. “She was talking more from the perspective of personal combat though, I think she just didn’t want me to be blind-sided and trying to figure out the new gimmick of the week on the fly. My impression was that it wasn’t a path worth even trying to pursue, because you need a plot of arable land.” I looked to the land around us, a solid square mile inhabited only by five people and a magical doe. “She said you could start with ordinary seeds, which would take a hellishly long time, or take seeds from a flower mage, which had to be done willingly and then half the time just failed anyway.”

“I wonder if she missed the heart of flower magic or gave you a poor overview on purpose,” said Solace with a frown. She put her hand up to shield her eyes and looked across the land, to the large tree whose interior space had once housed a dozen druids and now served as our group home. “That girl will have to give an accounting of herself.”

I frowned slightly at that, because Amaryllis was my friend, and I wanted to defend her, even over an innocuous comment like that. Maybe that was a little bit of me being a white knight, but my perspective on Amaryllis had changed over the last few days. She wasn’t someone who needed protecting, and certainly not from slightly rude comments by Solace, but that didn’t really tamp down my instinct.

“Things have been worked out, between the three of you?” asked Solace, because I had been distracted for a bit too long. “Grak is something of a gossip.”

“I … did not know that about him,” I said. I thought back to him telling me not to sleep with Fenn. “Okay, actually, I guess I did. But we haven’t had that much opportunity to talk. Anyway, things are fine between Fenn and Amaryllis and myself.” It had been three days now that we’d been at the foothills of the World Spine, sitting behind wards and setting watches, looking out for an attack that we were fairly sure wasn’t going to come. Fenn and I were sharing a bed, but --

“I gave Fenn some herbs that will prevent her from having a child, but they’ll take a few weeks to start working,” said Solace.

I could feel my cheeks grow warm at that. “Thanks,” I said. “It’s not really … we’re taking it slow.”

---

Slowish.

Fenn and I had been sharing a bed together since even before we started dating, because she “liked company” when she slept, and that hadn’t changed, which meant that each night was spent touching and kissing, snuggling and cuddling. The beds were all set into alcoves, which meant that there wasn’t terribly much privacy, and the deer kept sticking its stupid six-eyed head through the
windows of the tree house, which for me personally was a mood-killer. Fenn simply waved hi to it and went back to the kissing.

Even if we’d had a private room for ourselves, with an actual door we could lock, we probably still would have been taking things slow, because there were elven cultural ideas about ‘consumption’ and a different elven physiology, both of which made me less inclined to try to rush things, at least not before we’d had our first proper date. Our relationship had this frantic, manic quality to it, a desperation and need that almost frightened me, and all the moreso because both of us felt it. The phrase ‘like a dam breaking’ doesn’t really have that good of connotations, when you stop to think about it. It sometimes felt like we were a top, spinning out of control.

Her loyalty went up twice, once when I caught her looking over at me and she shot me a silly, happy smile, and the other other time when I passed by where she was sitting and gave her a quick kiss on the head. I had complex feelings about those loyalty messages, because I found them gratifying, but also didn’t want to see our relationship defined in game terms.

There’s a part of me that wants to sanitize it, to shield it all from view, to explain what being with Fenn was like but draw a curtain over the bed we shared and keep all that private. That’s my Midwestern upbringing talking, and to put up that curtain would be, in a sense, to presuppose that there was nothing there worth talking about, that nothing changed between the two of us as a consequence of those nights. And that is, if you know anything about relationships, clearly untrue, because it’s not like the sex part of things gets divorced from the romance, or the friendship, or any other component of the relationship. Even if you’re not talking, physical intimacy is a dialogue all its own. There’s this idea, I think, in some strands of Earth culture, where we turn from humans, to rutting animals, and then back again, and I don’t think that’s particularly true to my experience.

So, in brief, Fenn and I had spent the previous night feeling our way around each other, both literally and metaphorically. I had still not read what The Book of Blood had to say on the subject of elves and half-elves, specifically with regard to the topic of sex, which took up half the word count of any entry in the book. So when my hand stopped running over her body and slipped between her legs, I wasn’t just filled with nervous excitement for all the obvious reasons I would have been in the opening moves of a relationship. There was a real sense of the unknown. I focused on her entirely, feeling her with my fingers, watching her face. I could see her trepidation and feel the tension in her muscles where her body was pressed against mine.

I don’t know what exactly she feared, whether it was that I would pull away in disgust or study her like a clinical scientist, but she relaxed by degrees as I kissed and touched her, and I paid very close attention to the cues she was giving me, doing what got little intakes of breath or made her eyes go half-lidded, until eventually I found a motion that seemed to work well and stuck with it. I was rewarded with her legs clamping down on my hand and a low, soft moan that I was sure reached the ears of everyone in the house. As soon as she came back to her senses, she pulled me in and wrapped her arms around me like she never wanted to let me go.

Loyalty Increased: Fenn lvl 19!

Achievement Unlocked: Petite Mort

I blinked away the messages as fast as they came up and felt burning anger slowly rise within me as I listened to Fenn’s breathing slow back down to normal. I didn’t need the game’s affirmation. I didn’t need a fucking achievement pop-up. And what I really didn’t need was the reminder that the Dungeon Master’s watchful eye never left me, that I had nothing like privacy, that I was trapped in an existential nightmare that might pull the rug out from under me at any moment.
When Fenn’s hand rested gently on my stomach and she started kissing my neck, I gently pulled her hand back to me and interlaced our fingers, and whatever she thought of that, she fell into a contented sleep soon afterward. It took me quite a bit longer.

“The key to flower magic is understanding,” said Solace, changing the subject and snapping me out of my faraway thoughts. “Take a seed, plant it in the ground, nurture it as it grows, and all the while, you have to have a sense of that plant, and give it, as much as you’re able, a sense of yourself.”

“I’m not sure what that means in practical terms,” I said. “You’re saying that it’s essentially social, but with plants?” I frowned at that. My social skills were my worst skills.

“Social is a funny word,” said Solace. “I would say that it takes patience, insight, and dedication. That’s the path of true understanding.” Solace reached into one of her deep pockets and pulled out a thick, black seed, which she handed to me. “Plant this,” she said.

I looked down at the seed and turned it over once, looking at the rounded end where it had been attached to a stem of some kind. The edges of the seed were white, but the blending between black and white was imperfect. “And where do I plant it?” I asked.

“I can’t tell you that,” said Solace.

“Are you going to Mr. Miyagi me?” I asked.

“Miyagi-sensei was a very wise teacher,” said Solace with a small bow.

I stared at the short green woman with my mouth slightly open. “You’ve … seen Karate Kid? Let me guess, it was one of Uther Penndraig’s plays?”

Solace nodded. “We weren’t totally divorced from culture, back in the good old days before the Second Empire,” she said. “We accepted wanderers of all kinds into our domains. So yes, I’ve seen a very spirited version of it, put on by four enthusiastic players who stayed with us for a time. And the methods of teaching are sound.”

“I’m actually not sure that they are,” I said. “I mean, the wax on, wax off stuff seems more like it’s meant to instill mindless obedience and test patience rather than actually teach in the most succinct way possible.”

“And didn’t I say that patience was the path to understanding?” Solace asked with a smile.

I rolled my eyes. “At these words, Juniper was enlightened.” But Solace was over four hundred years old, and while the rebirth process presumably meant that she had to spend at least some time with the dexterity and senses of a newborn (TODO #432: ask about that), that still meant that she had a wealth of experience that I’d be pretty foolish to ignore.

So she wasn’t going to tell me where to plant the seed. That meant that I had to figure it out on my own. I turned the seed over in my hand again. There was basically nothing that the seed itself told me about the plant, though its size meant that it probably came from a larger plant, which meant that it would need room to put down roots and spread its leaves to take in sunlight. I was pretty sure that trying to predict a plant’s needs on the basis of what its seed looked like was really foolish, or at least unlikely to give good results. Although …

“This is a lesson on its own,” I said, holding up the seed. “Can I ask you any questions without defeating the purpose of the exercise, which is presumably about the process of discovery?”
“It’s for you to feel your way forward,” said Solace. “The feeling is important.”

I sighed at that, and began looking around the garden, both for a place that might be suitable to plant the seed, and for a Clue as to what kind of seed it was. Eventually I found a spot with flat ground and only some short grass that looked like an animal had been grazing on it (there was a fairly wide variety of animals within the bottle, though no predators). I used my hands to pull up the short grass, revealing rich, dark soil beneath it, then poked my finger in it to make a hole and dropped the seed in with the pointed tip facing up, as that was where the sprout would probably come from. When that was done, I pushed the earth back into place and stared at it.

_Skill increased: Horticulture lvl 1!_

“Okay?” I asked.

Solace shrugged.

“I mean, what do I do now?” I asked. “Plant more seeds? Can you, I don’t know,” I made Emperor Palpatine lightning hands at the ground, “Do some mystical druid stuff?”

“That would destroy your connection,” said Solace. “Planting other seeds would also weaken the empathic link you now hopefully have with this plant. Traditionally, someone starting with flower magic would have only a single plant, branching out into more only by the time they’d gotten a plant to a second or third generation.”

I stared down at the ground. I hadn’t even gotten a skill unlock for Flower Magic, though it was entirely possible that all you needed was Horticulture. In which case …

“So I’m monogamous with this plant, which might very well die because I put it in the wrong spot, or because a worm gets it, or a fungus, or a million other things?” I asked.

“Part of building the connection is tending to it,” said Solace. “It is, in a way, better if it depends on you. You will check it, every day, sometimes twice a day, and give it the protection and guidance it needs.”

“Huh,” I replied. “Can I tend to other plants then? Not to put too fine a point on it, but can I walk around the bottle with you and learn some lessons? Actually, can I learn lessons _at all_ about horticulture without compromising this particular connection?”

“Yes, all that should be fine,” said Solace, “So long as you form no new connections to any plants, and given that you aren’t planting them, it shouldn’t be an issue. I can take you to what needs tending. I began growing a fair amount of food, in preparation for finding you, and I thought that we might have a feast tonight.”

So I spent a few hours with Solace, moving around among her plants, helping to prune back branches, picking off dead leaves, pulling up some plants by the roots and watering others. It was nice to have a low-level skill that I could power up quickly again, but I still held a little bit of resentment toward the messages that popped up in my field of view. At the end, when I had leveled up Horticulture eleven times, she inspected one particular plant and gestured me closer.

“Here, this one is ready for harvest,” she said. She reached forward for a small bud, where overlapping pink petals had not yet spread into a flower. Her delicate green fingers touched just beneath where the bud was, and with slight frown of concentration and a pinch, she removed the bud from the plant. She held the small flower bud up to show me. “That, there, is part of the raw essence of the connection I forged with that plant,” she said. “The first time you do this, your plant will
probably die.”

I looked over at the patch of dirt. “That … seems bad.”

“It is,” said Solace. “But to forge a connection and use it, that is the source of power for a flower mage. Once you know what you’re doing, you can drain only part of that connection when you snip the bud.”

I sighed. “This does not seem quick and easy,” I said. Why can’t all magics be like blood magic, easy to pick up with a few sentences of description and two minutes of thinking about it?

“No, becoming a skilled flower mage takes time,” said Solace. “Is that another thing Amaryllis left out?”

“No, she was very clear on that,” I said. “So what does this bud do? How does it do what it does?”

“I can’t answer the how,” said Solace. “I doubt there’s a soul on the plane that could. But as for the what, that depends on the connection, which depends in turn on the both of you. This? she asked, holding up the pink bud. “A distilled connection, deep and powerful, between our two natures. For myself, the nature is usually one of hardness, or nurturing, or endurance, but there are others. This flower comes of a plant of simple stock, now dozens of generations removed from that origin, because I’ve been breeding it for quite some time. If I had to put it into words, they would be persistence, or pliability, or longing.” She squinted slightly. “I don’t know quite where that last comes from, but it’s right. And as for what it does, my sense is protection of some kind. In the past, with this one, it’s been a storm of petals that cloaked me in armor, or a red sap that stuck to my wounds, but the manifestation depends on the specific combination of our natures, and the time in which the bud is used.”

“That’s really not very helpful,” I said with a frown.

“Isn’t it?” asked Solace. “Isn’t knowing that you won’t know something helpful?”

“Given time, that seed I planted will sprout and grow, and eventually when it reaches its culmination in the form of a flower, I’ll pinch off the bud and it will die?” I asked. “And all that time and attention for a single spell whose nature I can only guess at?”

“Yes,” nodded Solace. “They are rarely useless, especially if the connection is strong, and they aren’t random, if you know your own nature, and that of the plant you stole the bud from.”

“That still leaves the question of how Vervain did it, if no one else could,” I said. “If he needed a connection to the plants, how did he have them all over the place? I mean, logically he wasn’t tending them. He just … had a knack?”

“Yes,” said Solace. “That’s as much explanation as I was ever given, along with the same warning that no one before or since has done as he’s done.”

“Hax,” I muttered. Then, when I thought about it, I realized that the answer might literally be hax. To the best of my knowledge, the game had not yet done anything that broke its own rules, nor had it fudged any dice. That didn’t mean that those things hadn’t happened, just that the game had plausible deniability. But if Vervain was a Merlin-type, and needed to be wise and mysterious with incredible powers, especially Powers as the Plot Demands, then maybe the game legitimately had hacked him to be that way. And if it hadn’t, then maybe it was something to look into. I was sure that thousands of people had the same thought before, but I was Juniper Smith, and I …

… actually had kind of a shit track record, when I really thought about it.
As we left, I looked in on the seed I had planted. The lesson that Solace had been trying to teach me was one of connection, understanding, and patience, but I wondered whether the game was trying to teach me a lesson too, by bringing Vervain to my attention once again. Whatever was being said to me, if anything, I didn’t understand it.
It did feel kind of weird to take a vacation, mostly because none of us had jobs. Actually, Grak had a job, which was as group warder, but for this one week the work he did was keeping the bottle warded against intruders, which was none too arduous. Solace had a vocation, which was as druid to the Six-Eyed Doe, and she was still doing that; so far as I could see, it involved a lot of walking the domain, changing various things in small ways, usually with the magic that came to her by way of the locus. But that left Amaryllis, Fenn, and myself with only our personal ambitions, and that, of course, led to some discussion.

“How was speaking to the flowers?” Fenn asked me as I came back from the nominal garden. She had come out to greet us with a smile on her face, which meant that she must have been keeping an eye out for when we’d get back. She had been smiling a lot these last few days, giddy, infectious smiles, not just when she saw me, but also when she was talking with the others, or helping prepare food, or bathing in the stream.

“It went well,” I said. “I am not, as yet, a master flower mage.”

“Well boo to that,” said Fenn. She reached forward and took my hand, then led me off away from the house. Solace gave me a smile and a raised eyebrow, and I could tell that all my protestations about ‘taking it slow’ had been understood as blatant lies.

It was weird, officially being in a relationship with Fenn. Weird in a good way. She hadn’t changed at all, except for a wild improvement in her already pretty chipper mood, but somehow the simple knowledge that we were together made her look so much more attractive than I had already found her. I watched her a lot, and caught her watching me, and we would sometimes just smile at each other like we were mentally impaired. I’d often thought that love, especially new love, was simply, literally, that: mental impairment caused by a flood of hormones and neurotransmitters within the brain. I still did think that, but I was in love, so didn’t really care, and I figured that at least during downtime, I could spare a few points of MEN if it meant being happy.

She led me to a part of the field beside the tree where a blanket had been laid down by some eager half-elf feeling a great anticipation at my return. She was wearing a bright yellow sundress, no doubt stolen from a store somewhere, which revealed her long legs, and her arms, which were scarred in intricately curling patterns.

“I would have been such a help with flower magic,” said Fenn as she flopped down onto the blanket. That too, was likely stolen from somewhere, because what Solace had made available in the main house were mostly furs, and not ones that had seen much working. “Helpful like you wouldn’t even believe.”

I laid down next to her and looked her over, which made her do a small shimmy on the blanket for me, and from there we were kissing each other, which went on for quite a while.

“Can I ask a question?” asked Fenn. As part of that process of getting to know each other on a physical level, I was starting to understand her cues, and from the way she was kissing me, she was telling me to slow down and talk, which I did, a little reluctantly.

“One kiss for one question,” I said.

“Do I have to give you a kiss, or do you have to give me one?” asked Fenn.
I paused at that, looking her over, with my eyes lingering on her lips. “Is there a difference?”

“Oh, you would know if I kissed you,” said Fenn. “So far I’ve just been letting you kiss me. Me kissing you? Totally different experience, very much different, but I would be willing to give you a single one of my extra-special kisses if you would entertain my question.”

“Oh, you would know if I kissed you,” said Fenn. “So far I’ve just been letting you kiss me. Me kissing you? Totally different experience, very much different, but I would be willing to give you a single one of my extra-special kisses if you would entertain my question.”

“Okay,” I said. “But I will be judging you harshly.” Her tone was light, but I was starting to be able to tell when her nonchalance was forced -- a sense I’d been honing even before we’d started dating, not that we had, as yet, gone on a date.

“Do you ever think about stopping?” asked Fenn.

“Ah,” I said, pulling back from her slightly. We were being serious, it seemed. “Meaning, instead of your dream of a big old castle, humble servants to wait on you hand and foot --”

“They would be oiled, muscular men,” Fenn corrected me.

I frowned at that. “And where am I, when you’re with these men?”

“Oh, you would be available,” she said. “Presumably you would be doing your own thing some of the time, in that version of my future.”

“But there’s another version now?” I asked.

“I was asking you the question,” said Fenn. Her eyes kept taking in different parts of my face as she watched me.

“Right,” I said. I looked down at my deformed hand. I was pretty sure that it would have hurt, if it weren’t so numb. “Assuming that I get my soul fixed, and that fixes my hand and ribs?”

“Yes,” nodded Fenn. “Do you ever think about getting to a stable point and simply stopping?”

“I hadn’t, actually,” I said. “Can I do that now?”

“Out loud,” said Fenn. She shifted so that she was sitting up, cross-legged in front of me.

“I’m not great out loud,” I said, shifting my position to match hers.

“Don’t care,” said Fenn.

“Alright,” I said. “Well, if by ‘stopping’ we mean abandoning every quest, saying goodbye to the party, probably not amicably given the things they all want to accomplish with our help … well, we’d have about six million obols worth of gold, depending on how we split things with Amaryllis, and I don’t know much about Aerbian market baskets or exchange rates, but I have to imagine that would provide us with a pretty decent, modest life together, especially since we could supplement the nest egg with actual work.”

“Together?” asked Fenn. Her pointed ears perked at that.

“Sorry,” I said. “We still need to schedule that date, and then see how things go from there.”

“Worst case scenario, I guess we can just be platonic friends who live together,” said Fenn.

“Could we still kiss, even if we were just platonic friends?” I asked. “Wait, did Aerib have a Plato?”

“ Heck, we could probably figure out how to platonically have sex,” said Fenn, and an
uncharacteristic blush came across her cheeks. Not embarrassment, or maybe some of that, but more the rising warmth of anticipation.

“A couple of platonic children?” I asked with a grin.

Fenn turned away, smile fading in an instant. “Quarter-elves.”

“Sorry,” I said. “I … I didn’t put points into my social abilities.”

“S’fine,” shrugged Fenn, turning back toward me. “It’s all fantasy anyway, right?”

“Do you really not want children?” I asked.

“I don’t think they would have it as bad as I did,” said Fenn. “There are better places than Rogbottom ever was, and I would keep them away from elves entirely, but … maybe, possibly, a hypothetical quarter-elf could hide who they were and pass for human. That comes down to variance. And even if they couldn’t hide it, maybe they would happen to fall in with some good people who didn’t really care one way or another. I don’t know. The world is garbage for a lot of other reasons. I never really wanted to bring a child into it.”

“Okay,” I said. “First thing I do, once I’ve ascended to godhood, I’m going to put my boot on the face of this world and say ‘hey, be nicer to half-elves’.”

“But to do that, you need to ascend to godhood,” said Fenn. “Hence, not stopping.”

I hesitated. “I’m not a hugely driven person,” I said. “I’m not like the heroes of stories who have this basic need to go out and right wrongs, or overturn an unjust society. I wasn’t like that back on Earth, and I don’t think that I’m going to be like that here.”

“And with that said,” muttered Fenn, not meeting my eyes.

“And with that said,” I continued, “I believe, in my heart of hearts, that Arthur is waiting for me at the end of this. I would go to any lengths to get him back. He was my best friend. I owe him that.” And as I said it, I began to feel guilty, because here I was, sitting on a blanket in the middle of a meadow with a pretty girl, as though I had forgotten all about that.

“Ah,” said Fenn. “So … no little cottage in the woods with your darling friend Fenn?” she asked.

“Yes, of course we’re going to have that,” I said. “There’s just a mountain of bullshit we need to get through first.”

“Alright,” said Fenn with a nod. “Not that I would have wanted to stop, necessarily, or that I wouldn’t have gotten bored of the contentment, but … it’s been on my mind.”

“And now I get a kiss, for having answered the question?” I asked. “A very special kiss, it was rumored?”

“Yes,” said Fenn. She hesitated slightly. “Last night, was everything … was there a reason that you were satisfied with just, being generous? Was it …”

“I got an achievement for it,” I said. “I mean, I wasn’t trying to get one, that wasn’t why I stopped, it just popped up, after you had finished. That kind of pissed me off, to have the game nose in.”

“Oh,” said Fenn, relaxing slightly. “And was I …” She paused, as though I could finish her sentence for her, which I couldn’t, at all. “Was I within your expectations?”
“I loved touching you,” I said. “I loved watching you as I touched you.” I didn’t fully understand what she was asking me, only that it was related to her hang-ups about sex. An affirmation of her as desirable, along with long nights of attentive lovemaking, seemed like the best way to deal with that. (So far as I could tell from touch alone, half-elven genital topology fell well outside the norms for humans, but it wasn’t any of the weirder scenarios I had been prepared to accept; it hardly seemed like a thing to get worked up over, unless you had a lifetime of people saying that it was.)

“Okay,” said Fenn, breathing out and relaxing. “Now, to properly receive my special kiss, you’re going to have to lay back and remove your pants.”

I was a simple man, and did what I was told.

I went back to the house some time later, while Fenn went to go ride the Six-Eyed Doe, a fairly common occurrence. Everyone seemed to like the magical deer a lot better than I did, and I couldn’t really figure out why that was. I knew my problems with it, like the fact that it could only really express vague emotions, or the way it seemed to be watching me far too often, or the fact that I didn’t really like deer as a species (though it was obviously only deer-shaped). What I couldn’t really figure out was why anyone else liked it.

I wondered how much of it was just a matter of shared culture that I was manifestly blind to, or the cultural weight of the Second Empire and their extermination campaign. I grappled with figuring out an Earth metaphor that might apply. It might be like the dodo being rediscovered, and the attention that would be lavished on it by people who saw it as a symbol of the horrors of exploitative colonialism. Or maybe it would be the same way that American culture had treated Native Americans, as though they were this font of intense spiritual wisdom rather than primarily being displaced people with a culture that had been frayed at the edges. Or maybe it was like seeing a number tattooed on an old woman’s arm and having this moment of shocked realization at what must have happened to her.

Even Grak seemed to like the Six-Eyed Doe; he went for walks with it, and reached up on his tiptoes to pat its flank. I was pretty sure that the dwarves, with their underground clans, had basically squat to do with the Second Empire or any shared cultural responsibility for what had happened to the loci, but there he was, bonding with it.

This wasn’t entirely academic. The historical records showed Uther Penndraig having seven companion-analogues, his Knights of the Square Table (I groaned whenever I thought about that name). However many companions were available to me, the Six-Eyed Doe was taking up one of those spots. More than that, I didn’t know what kinds of impacts increasing its loyalty might have, or whether taking it out of the bottle and introducing it to the world might require a stronger bond between the two of us. I could at least find some common ground with Solace, but with the magical deer? At best, I could practice meditation and feeling a sense of awe, or helping out to make sure that the bottled domain stayed in balance, but that seemed like a very slow path to building rapport.

(Amaryllis, Fenn, and Grak all got a paragraph-length character biography within the game’s “Companions” screen, which I was pretty sure happened on hitting Loyalty lvl 2. I’d closed my eyes and paged through after my little experiment in experiencing awe and wonder, only to find that instead of text, the Six-Eyed Doe had a picture that expanded outside the box it was meant to be set within. This was the first time that the game interface had shown me anything other than text, symbols, or lines to make boxes.

The picture had various scenes, devoid of any clear chronology and bleeding into each other where they met. When I looked at it, the view zoomed in, leaving the rest of the game interface behind and filling my vision with only the pictorial story of the Six-Eyed Doe. Most of it signified little to me,
because it was focused on rivers and forests, with the occasional animal. I focused in on people, where I could find them, and ended up looking at a full-on orgy with writhing, naked bodies of a hundred different species. To one side of it, up and to the right, armored men were coming in and slaughtering the people, but toward the bottom there were a handful of pregnant women sitting around, and beneath them various women giving birth, with naked children walking away through the woods, and some donning leather armor of their own to fight off the attackers.

This was the story of the locus, as told by some insane artist who had the ability to paint photorealistically at a yottapixel scale but lacked any idea of how to tell a coherent narrative. It took me some time to find the bottle, which sat all by itself, away from everyone. There was no attempt at being literal; it was only barely big enough to contain Solace, who sat with legs folded and her staff across her lap. It was such a small thing, in comparison to the rest, and that was probably the point.

The house at the center of the bottle was made from a massive tree, which seemed to have grown with an interior space suited for humanoid habitation all on its own. None of the wood had been cut or broken away, it just followed its own organic flow that happened to make openings for windows, entryways that approximated doors, a few flat surfaces that could be used as tables, and roots that happened to run parallel for a place to sit. Scattered through the large, curved room in the center were various alcoves, some only reachable by climbing, where the beds were. I use the term ‘bed’ loosely, because apparently ‘textiles’ were not a watchword of the druidic grove, and of course they had nothing like box springs.

We had, of late, taken over the floor space. A large, ornate desk lifted from the study of Weik Handum (by Fenn, naturally) sat there, clashing with the rest of the naturalistic furniture. This was where Amaryllis sat, with papers in ordered piles in front of her and a book open in front of her. She was making notes, with Grak beside her, looking on. I could hear Solace in the area of the big curved room that served as a kitchen, but she was just out of sight.

“What book is that?” I asked.

Amaryllis set down her pencil and turned to me. “I really don’t want to bring you back down to earth, but would it be possible for us to set some ground rules?”

“Uh,” I said. “About … what?”

“When I went out to get some water for Solace, I saw you and Fenn,” said Amaryllis. Saw us doing what, she didn’t say, but I wasn’t so tone deaf I didn’t understand her meaning.

“Ah,” I said. “I’d thought we were, um, far enough away.”

“You were not,” said Grak. He sniffed. “I put up a ward against sound around your alcove. Be warned it will fail as soon as the bottle moves.”

“Sorry,” I said, feeling my cheeks go red.

“Well I thought it was wonderful,” said Solace, coming in from the kitchen with a smile. “This place has been devoid of the sounds of pleasure for too long.”

And then I was really blushing, because it was one thing to get caught out, twice, in an embarrassing way, but it was another to get appreciation from a third party. I would have called Solace a creep for listening in, but it was really my fault. I could have asked Grak for some privacy wards, and I hadn’t, mostly because I had still had it in my head that Fenn and I were taking things slow, which the last half hour had shown me was not entirely accurate.
“I … would really rather not talk about any of this,” I said. “We’ll try to be more considerate of the close quarters.”

“That’s all I ask,” Amaryllis said. “I really don’t want to put a damper on,” there was a very slight hitch in her voice, which I might have imagined, “your happiness.”

“So what’s the book?” I asked, eager to change the subject.

“It’s a reprint of *On the Nature of Narrative*, by Uther Penndraig,” said Amaryllis.

I frowned slightly. “Let me guess, part of Fenn’s expansive collection?”

“Grak and I went into town,” said Amaryllis.

I stared at her, then looked to Grak, and finally to Solace. “This isn’t what we agreed on,” I said. “Using the teleportation key --”

“We didn’t,” said Amaryllis. “Last time we moved the bottle, I put us within a two mile walk of an unremarkable mid-sized city without a touchstone.” She bit her lip slightly. “And you’re right, I should have told you, but I was feeling claustrophobic and needed to get some fresh air.”

“Sorry, you’re going to chastise me for being inconsiderate when you left without telling me?” I asked. “Pot, kettle, et cetera. You put your life in danger, which means all of our lives.”

“The noise of your sex made this place feel too small,” said Grak.

“Nice and cozy, I thought,” said Solace with a shrug.

I was blushing again, but didn’t really have a good response, because me protesting that we hadn’t actually had sex seemed like it wasn’t all that great of a defense. Amaryllis had said that she was happy for us but a little forlorn, and … well, yes, we were being really really insensitive about that.

“Sorry,” I said again.

“I’m sorry too,” sighed Amaryllis.

“Sorry about what?” Fenn asked as she came in through the door. She was looking a little windswept; the locus could run incredibly fast, faster than even its long legs would have dictated. The smile she gave me was radiant, like she had just stepped off a plane to greet me at the gate after weeks apart.

“The noise, last night,” I said.

I could see Fenn blush at that. She was very pretty when she blushed, and it called to mind the color in her cheeks when she was kissing me. “Well, I blame Juniper,” said Fenn.

“Urk,” I said, grabbing at my chest. “Betrayed by my most loyal companion.”

“Uther had an obsession with narrative,” said Amaryllis, a little too loudly and quickly. She had moved back over to the table and was looking at the book. “It doesn’t show in his body of work, but if we assume that most of those novels and plays are plagiarized from or inspired by Earth, then we can still fall back on his non-fiction, which probably pulls from the ideas of Earth as well, but still contains his own framing of those ideas.”

“Amaryllis is searching for meaning in our journey,” said Grak.
“Yes, but, no. Uther searched for meaning in his journey,” said Amaryllis, “His personal life story mapped fairly well to the model of universal narrative he constructed, which his modern editor thinks is just an aspect of Uther’s mythmaking, or maybe that Uther’s works reflected who he was as a person and his own personal journey informed those works. Reading this, it’s pretty clear to me that Uther wasn’t just talking in the abstract, he was grappling with something.”

“So it’s a clue?” I asked.

“Not everything is a clue,” said Fenn and Grak in tandem. She moved forward to give him a high five, and he grudgingly returned it. I was starting to get the feeling that Fenn was just more popular than I was.

“Yes, I think it’s a clue,” said Amaryllis. “I don’t think that we’ll be able to predict too much by fitting our adventures to any kind of narrative structure, though I’ve started on the process, but I do think it might provide insight into how Uther thought, and from there, maybe into where he went.” She flipped a few pages back in the book, and gestured for me to come closer.

(It seemed a little unfair to me that Amaryllis hadn’t gotten any less pretty, now that I was with Fenn. I don’t want there to be any mistake about it, I was basically all-in on this new relationship, but Amaryllis was still stunningly gorgeous, and my heart beat just a little bit faster when I stood next to her. I wished there was some attraction switch I could turn off in my brain, but there wasn’t.)

“Here,” she said, pointing to the page. “It’s a circle. The hero starts at the top, in a place of comfort, then gets the call to adventure, --”

“Right,” I said. “This is cribbed from Joseph Campbell, Hero of a Thousand Faces, it doesn’t look anything different from what’s in there.” I had only read it because Arthur had insisted. This was more proof that Uther and Arthur were the same person, not that I needed it.

“Oh,” said Amaryllis. “So this is just more plagiarism? Words he repeated but which held no significance?”

“I don’t know,” I said. “I’ll add it to my reading list, I guess, but ... “ I traced my finger around the circle, which I was well-familiar with, because Arthur had been familiar with it. His biography had even mentioned the Refusal of the Call. Going around, Vervain was supposedly his Mentor, the Crossing of the Threshold would have been ... what, trying to seize the sword from the stone the first time? I would need to read both books in order to figure it out. “What does your provisional map look like?”

“For him, or for us?” asked Amaryllis.

I looked over her notes, which were done in her meticulous handwriting, with my character sheet sitting there among the other papers.

“For him,” I said. “I don’t understand the story map, given that he lived on Aerb for so long. Traditionally, the end of the story would be when he defeats the Dark King and takes power in Anglecynn.”

Amaryllis shook her head. “He talks about both cycles of repetition and nested cycles,” she said. She flipped forward another few pages, to show another diagram. This one had lots of circles on it, some in chains and others as circles within circles. “He says, basically, that narrative is infinitely extensible, that any conflict and its resolution can be mapped as being a number of smaller conflicts and smaller resolutions, some of which are taking place concurrently. If you really wanted to, you could write a sequel to any story, so long as someone is left alive, because the hero’s journey starts in a place of
comfort and returns to it with something having changed, and then you’re all set up for the next journey to begin.”

“That sounds almost nihilistic, if we take the context as Uther talking about his own life,” I said. “The story never ends, because there’s always more, barring death.”

“That’s life,” said Amaryllis. “He makes that explicit in a few places, the endings of stories are, in his view, just a contrivance, or a contract between author and audience about where to stop the continual cycles. If you were looking at his life, and trying to map it all out in accordance with these ‘journeys’, then I think that the cleavage points of circles are pretty clear.”

“He thought that our brains were wired for stories,” I said. “Arthur did.” It was easier to say his name now, because he was real in this world, somewhere, or at least had been. “Given that wiring, people see stories in things that aren’t stories all the time. The brain gets set up for stories, and fits anything close enough into that story shape.”

“You’re saying that not everything is a story?” asked Amaryllis. Fenn smiled and raised her hand for a high five, which Amaryllis left hanging.

“I’m saying,” I stopped and paused to think about it as Fenn high-fived herself. “I don’t know. If Arthur found it compelling, then he’s probably worth listening to, because he was the one who told me that about brains, and he would have done his best not to fall into that trap.”

“Tell him the theory,” said Grak.

Amaryllis frowned at him, but turned back to me and started in. “Let’s pretend that you’re Uther Penndraig,” she said. “You believe that life is a series of narratives, not in the sense that you can map narrative patterns onto life events, but maybe … there’s some controlling entity that’s responsible for spinning up a new tale. You’re part of a game, possibly, but it’s a game that’s trying to display these circles. How do you test it?”

“It depends on the genre,” I replied. “You said yourself that life never really ends, there’s always another struggle, another conflict. Unless you’re a god, you can’t really bring a final close to any of it, you can only have … breaks, I guess, or downtime. Places where the tension eases.”

“If we chart Penndraig’s life as a series of journeys, calls to adventure, metaphorical deaths and rebirths, then returns to comfort and a new normalcy, we can define a few large ones,” said Amaryllis. “And as a matter of fact, there are often dramatizations of those journeys. Penndraig against the Dark King ends with him restored to the throne. Meeting of the Seventeen Swords goes from the time he becomes king to just after the First Empire finally finds its footing. After that, there’s the Invasion of the Ice Wizards, then the Apocalypse Demon, then the Wandering Blight -- those are the major ones, from what we’ll call the Foundational Era, when threats started coming out of the woodwork to stop him.”

“Huh,” I said. “Were they all external threats that came to meet him?”

“Yes,” nodded Amaryllis. “And if we accept the world as artifice, as being as fantastically centered around him as you think it is around you -- not that you’re necessarily wrong -- then what defines the next era?”

I thought about that for a bit. “He couldn’t stay in his castle, with his wife and his children,” I said. “He couldn’t run the Empire he’d built. It depends on genre, and on the --” Dungeon Master “-- person controlling the narrative, but if the world is going to keep giving you explicit conflicts, a new call to adventure whenever you rest on your laurels, then staying in the castle only means that the
new threat or conflict has to be one that seeks you out.” I had only skimmed the remainder of the biography, but I knew enough about how he had shaped Aerb to know what came next. Besides, if you were thinking in terms of narratives, then it was pretty obvious. “Sitting on the throne means that you’re on the defense, forced into action when adventure comes calling,” I said. “If you think there’s going to be a new plot no matter what you do, then the smart thing would be to be proactive and seek that plot out, so that your family and kingdom can get on without being at risk from the outside.”

“The Roaming Era,” said Amaryllis. “After seven years of facing down threats, he picked up his sword, put on his armor, and went back out into the world to right every wrong that he could find.”

“And there were no more external threats?” I asked. “After three major attacks against his home, or kingdom, or empire, there was nothing that he had to come racing back for, something that only he could handle?”

“None,” nodded Amaryllis. “There are alternate explanations, of course, especially given how tight-lipped he was about his motives. I haven’t been able to find anything in his writing that would confirm that he went wandering in order to make the world stop throwing its own threats at him. It is, on the face of it, simply insane to think that the world would work like that. But --”

“But it might?” asked Fenn. “That’s what we’re saying, that we might live in a world where we have to go out and pick fights because otherwise the fights will keep coming to us?”

“That’s why we assassinated Larkspur,” said Grak.

“Assassination is a strong word,” said Amaryllis with a frown in his direction. “And he did come to us.”

“But you’re saying that we’re going to have to keep fighting forever?” asked Fenn.

“No,” said Amaryllis. She locked eyes with me. “I’m saying that Juniper might.” She shrugged. “If the hypothesis is correct, anyway. If Juniper’s ultimate aim is to find out what happened to the Lost King, for ill or good, then the only reason I think narrative is a promising line of inquiry is that I don’t think anyone else has tried following it before. That said, there are hundreds of theories about what happened to Uther, and I’m going to have to dig into them just to get a sense of what evidence everyone else has. We’re in a good position. If we assume that Uther Penndraig was dream-skewered, and more than that, a member of Juniper’s Dungeons & Dragons group, then that gives us an insight into him that no one else has.”

“If he really was Arthur, then he spent about forty years on Aerb,” I said. “I knew him as a teenager. All of his formative experiences were here, all the development of his ideas, he had a wife and children, loyal companions for, again, nearly forty years.”

“Even if that’s true, you also made this world,” said Amaryllis. There was something hard in her eyes.

“Not really,” I said, wincing. “I would say that it cribs from a lot of the worlds I made, but it’s … it’s an amalgam, a synthesis of those ideas, I didn’t make Aerb, I made a bunch of prototypes. And some of the ideas aren’t even mine, they’re just … ideas that I might have had. Or places where I cribbed from someone else.”

“You don’t think that you’re the closest thing to Uther Penndraig in this world?” asked Amaryllis.

“No,” I said. “I am.” I doubted that I would ever be Arthur’s equal here, but unless any of the other
members of the group reared their heads, then “teenager from our Bumblefuck, Kansas D&D group” was about as small of a subset as you could get.

“And what you would do, if you were trapped in this cycle like he was?” asked Amaryllis.

“I guess I would do what he did,” I said. “I would be proactive. I would go out conquering and slaying evils, and if I had to do it indefinitely, then so be it.”

“Each time winning by the skin of your lips?” asked Fenn.

“Skin of your teeth,” I replied.

“Teeth don’t have skin,” said Fenn with a frown.

“Yeah, look, it’s like a biblical thing or something,” I said, trying to move on. We seemed to get tripped on this kind of thing constantly, which was part of why I kept feeling like my list of things to know was growing out of control.

“What’s a biblical?” asked Grak with a frown of his own.

“I’m fairly sure that the idiom came from the mynah,” said Solace, “They do, in fact, have skin on their teeth, and are renowned for their ability to escape calamities.”

I rubbed my forehead. “Okay,” I said. “Fenn has a point.”

“About teeth?” asked Grak.

“If I were trapped in a cycle of endless conflicts and resolutions, and I didn’t know whether I was going to win every time, and I thought that maybe each battle might be my last, I wouldn’t want to continue on, I would want to stop and go live in a quaint cottage somewhere.” I glanced over at Fenn who was standing beside me, and she gave me a quick kiss on the lips. “Thanks,” I said.

I did my best to keep my heart rate down and not blush as I turned back to Amaryllis. “He was always more driven than me. He was in all the clubs, he was prepared for college, he read five times as many books as I did, he was prepared to defend every absurd thought that occurred to him -- he was more of a fighter than I was. Non-literally, that is.”

(I was pretty sure that if I had died instead of him, the idea of committing suicide wouldn’t even have occurred to Arthur.)

“So, I think he would have lasted longer,” I continued. “But maybe he reached the end of his rope, in which case …” I looked down at the diagram, of circles within circles, and a long string of circles that represented sequels without end. “If it’s just an endless series of conflicts and resolutions, then there’s no escape, but maybe you could think of it all as being embedded in a single, enormous, forty-year story. In which case -- when were the infernoscopes invented?”

“20 FE,” said Amaryllis.

“If he was trying to complete the loop on the in-world layer, then maybe he was trying to go into the hells and rescue his family there, or maybe banish the hells entirely,” I said. That didn’t quite feel right to me though. “If he were me, then maybe he would try to find the god of this place and have a talk, or a fight if he could manage it somehow.”

“Which of the gods?” asked Solace.
I shook my head. “I mean, something brought him here,” or recreated him here, “So, maybe, he went to go find that entity, whatever it was. I’m … not actually sure that logic extends properly though, because obviously if the world runs on narrative -- no, if Uther’s life ran on narrative, then it seems like the person or thing that sucked him into this world would be outside of that narrative structure. It doesn’t quite make sense to try to close the loop that way.”

“We’re too deep in assumptions,” said Grak.

“I agree,” said Amaryllis. “We need more direct evidence that can point us in a helpful direction. Joon, I’d like for you to think on it more, and I’ll bring you whatever it is I can find.” She hesitated. “If you’re comfortable with that.”

“That’s fine,” I said. “You know your own history far better than I ever could.” It made me slightly uneasy to entrust this to her, but it was clear that the one book I had on Uther Penndraig barely scratched the surface, and I was pretty sure I knew the next turn that this conversation was going to take.

“So in other words,” said Fenn, “It’s reasonable to suspect that Juniper can’t sit around either? Otherwise we’re going to get visited by a demon bent on world destruction?”

“I’m building a timeline of what’s happened since Comfort,” said Amaryllis. “It’s not done yet. And Grak is right, we’re too far into assumptions. We don’t want to stand still anyway, that doesn’t further our mutual goals,” she glanced at Grak. “Grak is the exception, given his payment schedule.”

Grak shrugged.

“The more important part of charting what’s happened to Juniper is in mapping it to both what happened to Uther, how Uther thought about narrative, and how the logic of what’s come before applies to what might happen after,” Amaryllis continued. She glanced briefly at Fenn. “But it’s a work in progress, and I don’t feel comfortable using it to make predictions, as yet.”

“So you think I’m going to die?” asked Fenn. I looked at Fenn and saw unexpected tension on her face, mixed with anger.

“There are too many variables,” said Amaryllis. “It’s too much guesswork.” Fenn continued to scowl at her. Amaryllis flipped through the book, until she got to a specific line, which she read out loud. “‘It is a universal truth that narrative hates stasis. Narrative is built around interlocking rings of conflict and resolution; to the extent that a narrative allows stasis, it is by recycling these rings of conflict, repeating that which should by rights have been resolved. Yet that can only continue for a certain amount of time, at which point the audience grows bored, and anyone who cares about narrative qua narrative will make a fundamental change at that point, often to the detriment of the protagonist.’”

“Okay,” said Fenn. “I’m officially not a fan of this theory.” She turned away from us and left the house, not quite stomping away.

“Alright,” I said with a nod to Amaryllis. “I guess you better tell me what happened with Uther’s wife.”

"It wasn't his wife," said Amaryllis. "It was all the others."
“Uther had a lot of love interests who died?” I asked. “I mean, he had love interests … in addition to his wife?”

“Which version of history do you want?” asked Amaryllis.

“I want the truth,” I replied.

“I don’t know the truth,” said Amaryllis. “Juniper, you have to understand that this was all five hundred years ago, and he was a very private man. Even if he wasn’t, the fact that he was such a central figure in the founding of the First Empire, not to mention the dynastic head of what would become the Lost King’s Court, not to mention that he founded two of the athenaeums — he was really, really important, and his role in history very quickly became a matter of politics. The historicity is complicated.”

“What are my options, as far as versions go?” I asked. What I really wanted was a clear, concise explanation of why Fenn was upset so I could go comfort her and explain that everything was going to be alright.

“There are two extremes, one where Uther is a saint, the other where his terminal flaw was a love of women,” said Amaryllis. “There’s a temptation to say that the truth lies somewhere in between, but I think that’s something weak-minded people say when faced with two options they can’t distinguish between. For the most part, the history books sweep it all under the rug as unimportant.”

“Fine, give me the version where he’s a saint,” I said. Arthur hadn’t been a perfect person, I wasn’t so blinded by his passing as to believe that, but Amaryllis seemed to be implying that some people saw Uther as one of those politicians constantly embroiled in sex scandals, and that really seemed out of character for him.

“His marriage to Zona was a political one,” Amaryllis began.

“There was one before that,” said Solace.

Amaryllis frowned at her. “No,” she said, but it was almost a question.

“There was,” shrugged Solace. “Or at least, that was what I always heard. If you’ve heard differently, then perhaps I’m wrong. In my life I’ve spoken to a number of people who knew him, but perhaps we should trust the histories that you’ve read.”

“I’ve met three of the gods in the flesh,” said Amaryllis. She didn’t try to keep the defensiveness from her voice. “I’ve known plenty of people who met him.”

“And they don’t mention Morana?” asked Solace.

“Oh,” said Amaryllis. She furrowed her brow slightly. “She wasn’t … “ She turned to me. “Morana was a spy for the Dark King, one that Uther turned to his side. The Dark King killed her not long before he met with Uther in single combat for the final time. But Uther and Morana never --” she looked at Solace, “I hadn’t heard the theory that they were intimate.”

Solace shrugged.

“And then after that, Zona was a political marriage,” I said, prompting her to continue. I wanted to
leave the house and go find Fenn, but Fenn must have known at least part of this story, and if she was upset about it and what it might mean for our own future, then I didn’t want to force her to tell me this story.

“Zona Delzora was the Queen of the Zorish Isles,” said Amaryllis. “They had been part of Anglecynn for hundreds of years, but declared independence when the Dark King swept in, and made a series of treaties with him as he tried to quell the rebellions. The Zorish Isles presented barriers to trade for Anglecynn -- this was before bulk teleportation -- but they had also been destabilized by the Dark King’s passing. Joining two countries in personal union is never a simple thing, but it was the most elegant solution to their problems for a number of reasons.”

“And then they fell in love,” I said, because obviously that was how that story went.

“They were both private people,” said Amaryllis. “There are too many stories about them that are pure fabrication.”

“He resisted her,” said Grak. “She wanted to seal their marriage with a pregnancy. He refused because he did not love her. It took time for them to love each other. That story was told to me when I was promised for pair-bonding. I don’t know whether it is true.”

I felt a chill at that. It wasn’t just Amaryllis who had that burden placed on her, it was Grak too, and where she would undoubtedly have gone through with a political marriage, Grak had left his clan behind rather than accept one.

“Well, the way I was told it, he was distraught over Morana,” said Solace, “Zona loved him from almost the moment that she first heard of he was going against the Dark King. It was politically convenient, but she was also infatuated with him, and he resisted her because he hadn’t gotten over Morana.”

“There are too many stories,” said Amaryllis with a frown. “We can just leave it at there being too many stories. It’s important, insofar as it informs who he was and what we can take from the narrative theory, but we do not know. Putting forward more possibilities is not helpful.”

“What do you think it was?” I asked. She had compared herself to Zona; I wanted to know what she thought that comparison meant.

“I have no idea,” said Amaryllis, folding her arms across her chest.

“Most probable?” I asked.

She watched me for a moment. “Fine,” she said. “If, if, he was from the same culture as you, I would say that the most likely explanation is that he had some discomfort with the idea of an arranged marriage without any element of love. That might explain why he was derelict in his duty.”

“By not inseminating her right away,” said Grak with a nod.

“Yes,” said Amaryllis. “One of the things that the stories have in common is that it took some time for them to consummate the marriage, so that part, at least, seems like it would be true. If Zona was typical of her status and culture, she would have been ready and willing to receive him.”

“But they were in love, eventually?” I asked. “And she survived into old age?”

“She died at fifty, a few years after Uther disappeared,” said Amaryllis. “If she hadn’t, Anglecynn probably wouldn’t have gotten so close to civil war. But for most of her life, she was sickly.” She pursed her lips. “You want to go after Fenn, is that why you’re jumping ahead?”
I nodded. “Not that I don’t find this interesting, but I want you to get to the point. Why does she think that she might die?”

“Whatever happened between Uther and Zona, she gave him two sons and a daughter, all in fairly quick succession,” said Amaryllis. “This was during the period when the First Empire had been founded but not all of the eventual member polities had joined. A year after Dahlia was born, the ice wizards invaded, and Zona was kidnapped. Uther brought her back, but they didn’t have terribly much time together before the Apocalypse Demon arrived and began controlling her mind from afar. It was the Wandering Blight that cost her half her body, everything below her rib cage. She was kept alive in torment by powerful healing magics for a full month before Uther managed to manipulate himself into a forge frenzy -- no, I don’t know how, he only did it once -- and crafted her six mechanical legs that numbed her to the pain and allowed her mobility. Still, from that point on she was thin and frail, despite his best efforts.”

“Shit,” I said. I could see how that would map to a narrative. Each major conflict he faced imperiled his wife in some way, just to add some interpersonal drama to the proceedings. And from what Amaryllis was saying, if the narrative theory was true, and his life was shaped the way it was for an overarching reason, then this was the best case scenario for Fenn.

“In the story of Uther as saint,” Amaryllis continued, “This is the part where his wife begins bringing nubile young women in to give him sexual satisfaction. He refuses, because he loves her, and … it’s presented as a farce, usually, with all sorts of naked women stepping out from behind the curtains to ambush him at inappropriate times.” I could tell that she didn’t find that funny, but I heard a faint chuckle from Solace. I knew that Fenn would probably find it funny too, if not for the possibility that it would end up paralleling our own lives.

“And eventually he relented,” I said.

“He had an assistant,” said Amaryllis. “She was strong and capable, one of the first computers, gifted with an organizing efficiency that many powerful men would kill to have by their side. She traveled with Uther when he left to seek out adventures. Three months in, she was skinned alive by a dragon. Any romance between them is purely speculative, but it was the start of a trend.”

“Morana was the start of the trend,” said Solace, shaking her head.

“But there is a trend?” I asked. “A trend of more than three, if we’re counting what happened to his wife?”

“Twenty,” said Amaryllis. “That’s approximate. He was a private person, it’s not always clear what his relationship to those women was, but it was clear enough that people talked.”

“And horrible things happened to all of them?” I asked. “Twenty women, that’s about one a year from age thirty-five to fifty-five, he had to have seen the pattern. Other people had to have seen the pattern, I -- I don’t understand why anyone past the tenth would have gotten within a hundred feet of him.”

“Communications then weren’t what they are now,” said Amaryllis. “There was no international radio network, no teleportation network, none of the mechanisms that we use to make the Empire of Common Cause a cohesive political entity. The First Empire fell apart for a reason. It probably would have even if Uther hadn’t been irreplaceable. And as for the women, there were many theories as to what, exactly, was going on. It was common enough to say that there was no need for a deeper explanation; Uther traveled the world, seeking out its most dangerous possible places, and the fact that people died around him was a natural consequence of that.”
“He would have seen it,” I said. I started pacing, just to have somewhere to put my energy. “If our theory is that he started wandering the world in order to be away from his wife and children, then obviously he had to have seen it.”

“I do think that’s a natural consequence of this narrative theory and how he would have interpreted his own life,” Amaryllis agreed.

“Then how could he?” I snapped. “He’d have known after the, the fifth one surely, but he just -- kept going in the knowledge that they would die?”

“Do you need to take a break?” asked Amaryllis.

I stopped and took a breath. “I don’t know,” I said. “I was hoping to figure out something to tell Fenn. Either a hole to poke in this theory, or a reassuring alternate explanation, or … something.”

“Does it need to be true?” asked Amaryllis.

And that actually gave me pause, because I guess on some level I was a stupid asshole that just wanted the problem to go away. There was probably a world where I said that no, it didn’t need to be true, so long as it was convincing. “Yes,” I said. “It needs to be true. Or, if not true, because we don’t know the truth, then something that might mean that my life here isn’t fucked.”

“She’s not your life,” said Amaryllis.

I turned away from her at that and started to walk out of the house, then turned back and took a deep breath, unclenching my fists and trying to relax my muscles. I tapped into blood magic to slow my heart rate, though I wasn’t sure that would actually do anything to get me in a better frame of mind. “I know that,” I said. “I know that this is bigger and more important than what’s going on between Fenn and me. I’m sorry for not approaching this rationally.”

Loyalty increased: Amaryllis lvl 13!

Loyalty increased: Grak lvl 6!

“No, I’m sorry,” said Amaryllis. “I shouldn’t have --”

“It’s okay,” I said. “I’d still like to hear the other explanations for what happened to these women. You said that some people didn’t see the need for a deeper explanation, but for the people who did, what did they come up with?”

“It’s a mixed bag,” said Amaryllis. “Some of it I’ve only read this morning and still need some time to process. If you take Uther as a more complicated person -- I’m not saying anything about your friend, only about how people view a very opaque historical figure -- then he and Zona had a loveless marriage, and his philandering predates her injuries, with all the stories about their love being akin to propaganda, or possibly literal propaganda. And if that’s the case, then perhaps the unifying force behind those deaths is Zona herself. I don’t personally believe it, but I need to do more research. I need to do a lot more research. It’s possible that the meme has no basis in reality.”

“Meme?” I asked.

“A meme is a concept or idea that spreads from person to person,” said Grak.

“No, I know what a meme is,” I said. “I just didn’t know that was a thing that you had on Aerb. Was the term … was the ‘meme’ meme introduced by Uther?”
Amaryllis nodded. “He believed that ideas were important and devoted a fair amount of his energy to spreading beneficial ones far and wide.”

“Hum,” said Solace. “Perhaps it would be better to say that he spread the ideas that he thought were beneficial far and wide.”

Amaryllis seemed like she was about to say something, but perhaps the subtext of what Solace had said became clear to her, because she stayed quiet. The subtext wasn’t clear to me, but at a guess, I’d have said that you didn’t get a Second Empire without a First Empire, and some of the beneficial memes that I would have tried to spread were things like global (hexal) connectedness, cooperation against greater threats, systemization of information and knowledge, economic interlocking, and the ordering of society. If Arthur had kicked this world into the Enlightenment, or at least laid the groundwork for it, then I could see how a druid would feel the stirrings of rebellion against that.

“What do you need from me, to get answers?” I asked. “Are there resources that I can devote to helping you, brainpower I can add, something to help speed up you trying to, first, figure out whether there’s actually anything to this narrative theory, and second, the bounds of it, and third, what I’m supposed to do about it?”

“Grak and I have been working on it this morning,” said Amaryllis. “None of it was ready. You can go tell Fenn that. I might have made her worry for nothing. And even if Uther was onto something in how he spoke of narratives, even if you’re a mirror to him, then that doesn’t mean that the rules are the same. She might have more in common with the Knights than with the lovers. So far as I know, for Uther they never coincided, but we can’t be sure who was or wasn’t linked to him like we are to you. Grak and I will work on it more.”

That left nothing for me to do. “You want to cut me out of the loop?” I asked.

“It’s too personal for you,” said Grak. “You can’t look at it with clear eyes.”

“That’s probably true,” I said. Not just because of Fenn, but Arthur too. “The risk you run is that you present a case for me and I instantly shoot a hole in it, because I’m the only one capable of seeing that hole. And beyond that … I wouldn’t expect this place to have stories in the same sense that plays and books do, because the trappings, at least so far, are all from tabletop games, and stories work differently there. It’s less clean. I’ll help and try to stay rational about it.”

“This was supposed to be time off,” said Solace in a mild tone. “It’s good for the body, mind, and soul to be carefree, when there’s any allowance for it.”

“I’m not sure there is,” said Amaryllis. “If the narrative theory is true, or at least has a grain of truth, then we have a limit on how long we can sit in one place. Figuring out that limit would be important.”

“Ah, well,” said Solace, “I’m sure we think very differently about understanding.”

“I’m going to go find Fenn,” I said to Amaryllis. “Let me know when you have something.”

There weren’t that many places to go within the bottle; from the tree house in the center, it was a half mile to every edge, though the house was slightly off-center. The first thing I looked for was the giant deer, which wasn’t too hard to spot, and as I moved closer to it, I saw Fenn, in her yellow sundress and black glove, holding her bow and looking up, with the doe sleeping quietly beside her.

“Hey,” I waved to her as I got closer.
“Hey,” she said, eyes toward the sky. “Wanna see something neat?”

“Sure,” I replied.

Fenn raised the bow above her head, materialized an arrow in her gloved hand, then fired it straight up. “Okay,” she said, tossing the bow to the ground and drawing out an apple from Sable. “Watch and be amazed.” She licked her lips as she looked up in the air and held the apple out in front of her.

“Fenn, is this safe?” I asked, panic rising slightly.

She gave the apple a small toss and withdrew her hand just as the arrow came silently dropping down. It pierced through the apple in mid-air and then drove into the ground with the apple caught on the fletching.

“Ta da!” she said.

“That was actually really impressive,” I said, moving closer to her. It was actually so impressive that I didn’t think it was within the realm of possibility for a human.

“I wouldn’t have been able to do that a month ago,” said Fenn, looking at the pierced apple. “I’ve gotten better without much in the way of practice. And my luck has gotten a lot stronger than it was too, which should be impossible without at least a hundred years under my belt.” She turned to me. “So those are the upsides.”

“Not including my amazing company?” I asked.

“Well, that too,” said Fenn. She held up her hand. “I’ve got a nifty glove, and there was that armor I had for a bit before I was literally cut into two pieces and spilled the majority of my blood on the forest floor.” She gave me a nonchalant shrug. “Oh, plus I’ve gotten to kill a lot of assholes lately.”

“You take pleasure from that?” I asked.

“I figure if you’re going to do it, then you might as well enjoy it,” said Fenn. “I’ve spent most of my adult life killing the undead, it makes it easy to just think of people as bodies, not actual living, breathing creatures with their own hopes and dreams. And even then, it’s been a lot of assholes. Asshole hopes, asshole dreams.”

“I get their names,” I said, pointing to my eyes. “Most of the time, anyway. I don’t really know how the game decides between what’s a named and non-named character, but --”

“Can you not call it a game?” asked Fenn. She took off her glove and tossed it to the ground.

“Sorry,” I said. “The … interface?”

“No, something better than that,” said Fenn. “How about washater, does that work for you?”

“More elfish?” I asked.

“It means something like game or system,” said Fenn. “A set of artificial rules. How have you not learned Elfish yet?” Wah-sha-tehr, a set of rules, five words of Elfish down, thousands to go, plus a whole new set of rules. Yay.

“I tried learning Groglir with Grak. It didn’t really take in the way I hoped it would,” I said, “The, um, washater didn’t seem to want to grant me the ability to speak it after an hour or two, which means that either I didn’t get enough basic knowledge and practice in, or maybe … I don’t know,
maybe it’s just not something that it’s ever going to help me with. D&D always fudged the concept of language. Most games do.”

“We should play some D&D,” said Fenn. “We’re taking some time off to recuperate, why not do a thing that you like doing? You said that it was best with one dungeon master and four people, better to do it now before we get another companion. And besides, Amaryllis has her head up her butt about narratives, but she’s going off of plays and stories. For all that you talk -- *incessantly* talk -- about games, we’ve never played one.”

“I … huh,” I said. “That actually makes a lot of sense. I knew I kept you around for a reason.”

“Oh, only *a* reason?” asked Fenn with a smile.

“Maybe if I dug deep I could list a few more,” I said. I shifted my weight and tried to formulate what I wanted to say next. “Did you want to talk about the downsides of being with me?”

“Not really,” said Fenn. “Our lovely locus helped me to calm down, and … you’re working on the problem, if there is one?”

“Yes,” I said.

“Do you have a quest?” she asked.

“I … no, I don’t,” I said.

I wasn’t even sure how that would work. Obviously if there *was* such a thing as a narrative, presumably being controlled by the Dungeon Master, then having a quest to defeat the force of that narrative would be a severe mixing of layers. Did that make four layers in total now? There was the reality of Aerb, the game layer that sat aside from it, and then the super-reality where all this was being simulated, or if it wasn’t actually a simulation, then the true reality that it was sitting on. I wasn’t sure that narrative had its own layer in all this; maybe it was better to think of it as an agent with multi-layer access, like the Dungeon Master. Or maybe narrative was just a manifestation of the Dungeon Master.

“Well, even if there’s no quest, I would prefer for this to be at the top of the queue,” said Fenn.

“Of course it is,” I said. “Fenn, if anything happened to you --”

“I said I didn’t want to talk about it,” replied Fenn with a frown.

“I don’t want to let it fester,” I said.

Fenn sighed. “If I spent time focusing on every shitty thing in my life, I wouldn’t have time to get anything done,” she said. “Maybe this is a problem, maybe it’s not, maybe you can do something about it, maybe you can’t. Maybe I’m doomed to die, or at least be horribly maimed. More than I already have been, anyway.” She glanced at her scars, and at the thin, faded red line that still marked where she’d been cut in half. “I trust you and the others to figure things out and tell me whatever is best for me. Well, I only *mostly* trust Amaryllis, as much as I might like her. But you’ll be there to supervise.”

“I did think the timing was suspect,” I said.

“You show a remarkable lack of tact last night, and then in the morning she has a new theory that means we can’t be together?” asked Fenn.
“Sorry, I showed a lack of tact?” I asked with a laugh.

“Well, it was really very rude of you,” said Fenn, smiling slightly. “But honestly, I don’t think that Mary often does things for herself, she said that she would slit my throat if she had to --” Fenn saw my expression, “Oh, no, it was a unicorn blood thing, she preceded that by saying that she liked me quite a lot, and after she said she was willing to kill me, she said that she hoped that she never had to, so I really thought it was sweet, in its own way.”

“I might have to talk with her about that,” I said.

“Please don’t,” said Fenn. “Is it any different from what you thought of her already?”

“I guess not,” I said. Amaryllis was stronger than me, in a scary sort of way; I wasn’t sure that I would ever be able to kill her, even if I thought that was the smart thing to do. The thought of it made me a little sick. In my mind’s eye, I stayed my hand.

Fenn stepped closer to me and gave me a slow kiss. “I think I’m done talking for a while. Can we forget everything, just for a bit?”

I took her hand into mine. She was close enough for me to smell her, a pleasant, earthy scent. “You think this is wise, given things being how they are?”

Fenn shrugged, then kissed me again. “I think that I’d like to not think about that.” She reached up and touched my neck with her slender fingers. “And if we’ve made a mistake, then I’m fine with making that same mistake a second or third time.”
A side story for *Worth the Candle*, *The Council of Arches*, is best read immediately before this chapter.

**Skill increased: Parry lvl 20! (Skill can no longer be increased by amateur training.)**

**New Virtue: Prescient Blade!**

*Prescient Blade:* You take half the normal penalty to parry bullets, arrows, or other missile weapons. These attacks still do damage to your blade as normal.

I was happy to get that one in the course of my training, since I’d had Parry hovering close to the soft cap for quite a while, but while it was a good one, I did find it a bit puzzling, because I had gotten the ‘Nascent Blade-bound’ virtue when Parry had hit tenth level. My confusion was cleared up a few hours later.

**Skill increased: Two-Handed Weapons lvl 20! (Skill can no longer be increased by amateur training.)**

**New Virtue: Lunge Striker!**

**New Virtue: Neophyte Blade-bound!**

I stopped our sparring practice and stared at the messages. I had been dueling both Fenn and Amaryllis, though we were all using blunted blades; Fenn wasn’t terribly good with a sword, and Amaryllis was noticeably worse than I was, but together it was a losing battle for me, which seemed to suit them just fine. I closed my eyes and went to the screen to read what the virtues did.

**Lunge Striker:** Eliminates the maneuverability penalty for all reach weapons. Eliminates the penalty for striking at close range with reach weapons. Allows you to more quickly cover ground when moving in short bursts and in a fighting stance.

**Neophyte Blade-bound:** You have unlocked the ability to bond with a melee weapon, given a few minutes of meditation. You may only bond with one weapon at a time. When wielding a bonded weapon, double your effective skill with it, double your chance to parry, and you may cut with it as though it were twice as sharp.

The second level of the blade-bound virtue seemed really, really good to me. I had gotten the original Nascent Blade-bound virtue from increasing Parry; I frowned for a bit trying to figure that out. The best I could come up with was that it took some combination of skills raising above a certain amount to get the blade-bound virtues. If I was remembering correctly (and at 8 KNO I had better be), then Parry had been one of the last melee skills I had trained when I was getting everything across the lvl 10 line. Now it was Two-Handed Weapons that I was training up last, so logically if multiple benchmarks was the condition for a ‘free’ virtue then I wouldn’t have hit it until now. I filed this bit of trivia away in my notes.
(This also opened up the possibility that there were other virtues to be had from synergistic skill ups.
I didn’t know how many skills were part of the blade-bound package, but two was the minimum,
and it seemed likely that it was more on the order of three or four, based on what I knew blade-
bound could do.

The problem was, blade-bound were a known quantity in this world, and I hadn’t heard of
something similar for someone who excelled at the arts in combination with each other, or the
synthesis of different types of magic.

My best guess was that the bone magic, skin magic, and blood magic might all synthesize into
*something*, but they hadn’t yet, which meant that there was either a fourth or fifth out there, or no
synergy incoming. The logical one to round out that group was pustule magic, a path I was
understandably reluctant to go down.)

We did spar for a bit more after I had bonded with the Anyblade, and the jump in skill was apparent
to all of us; I could pretty comfortably hold both of them off at once, unless they got tricky. Granted,
neither of them were proper swordsmen, but if lvl 20 represented something like a graduate degree,
then an equivalent of lvl 40 in Two-Handed Weapons was well into whatever the postdoc equivalent
of hitting people with a sword was.

I think that of all the skills I was trying to blast through during “vacation”, Gem Magic was perhaps
the worst, mostly because it left me with the feeling of being mentally drained, like I wanted to zone
out and just watch some television, except that television hadn’t been invented on Aerb yet, and
anyway, the signal inside of a bottle at the foothills of the World Spine would be, I was guessing,
terrible. So instead, after I was done draining my mental reserves by knocking cans off a stump at
fifty paces, I would go seek out my party members and do my best to listen to them, mostly to let
their words wash over me, often with Fenn cuddled up beside me.

Solace liked talking the most out of any of us. I thought that was probably because she’d lived so
much of her life with other people around her in a tight-knit community, and once that community
was gone, she’d been left all alone. She was also four hundred years old, and had all sorts of stories
about the way the world had been. I don’t know if it was just her outlook, or deliberate effort on her
part, but she rarely mentioned the bad stuff that was lurking in her past. She revealed in an off-hand
comment that she’d had children, but she didn’t say what had happened to them, and I didn’t have
the heart to ask.

We tended the garden together during the day, but it really didn’t need all that much, and I had no
real hope of getting Horticulture to the lvl 20 mark, where a virtue was presumably waiting for me.
While the seed I planted did sprout by our last day of rest, it was going to take weeks at the earliest
before I had my first bit of flower magic -- hopefully.

She spent most of her time outside, and much of it with the Six-Eyed Doe, though she could often be
seen fully nude, splayed out on the grass to soak in the sunlight for photosynthesis.

At our D&D games she played Case, a defector from the evil scurrilies, whose overarching goal was
to lift the curse that the God of Scurrily put on her race.

I took more language lessons from Grak, mostly because I couldn’t think of a better way to get one-
on-one time with him without being horribly awkward about it. I think I bothered him by going off-
topic too many times, but the great thing about language was that it was inherently cultural, and that
gave me plenty of opportunity to ask him about what it had been like at Darili Irid.
This did lead to a thirty-minute lecture from him on dwarven self-insemination, which I was about 60% sure he went into in order to get me to stop asking questions. Unfortunately for him, I found the whole thing to be fairly fascinating, if gross. I eventually had a fairly mediocre command of Groglir, enough that I could stumble halfway through a conversation before falling flat on my face. My first guess had been that I would need to learn a hundred words before I got a pop-up, and when I crested firmly into a vocabulary of one hundred and fifty words, my next guess was that I would either get it at five hundred, a thousand, or just not at all. A real-world guy named Charles Ogden had created something called ‘Basic English’, which had a basic list of eight hundred and fifty words that he thought would be enough to speak ‘in a normal way’, and if I were making some arbitrary cut-off for language learning, that would have been it -- but learning eight hundred and fifty words of Groglir, along with all the variations on them, was still going to be a time sink, and I would arguably not get too much out of a potential language skill if I had to do that for every language that I came across.

I gained a single point of loyalty from him, bringing him up to 7, when I apologized if my relationship with Fenn made things awkward, but that was about as much as I got for my efforts. I’d had this idea of ‘grinding loyalty’ with him, but it didn’t really pan out like that, no matter how much we talked. He had, apparently, made up his mind about me and trying to budge him wasn’t easy, especially since he knew that I wanted him to be more loyal. I’d tried telling him the same thing I’d told Amaryllis, that he would become more powerful, but that didn’t sway him like it had swayed her.

Grak played Bachewin for our tabletop sessions, a stout young woman trying to reclaim the honor her family had lost. He wasn’t very good at roleplaying, though he did learn my (entirely homebrew) rules system quickly, and after our second session he had some very specific ideas about who Bachewin was, which he shared with me at length. (He shot down all my attempts at contribution, and his loyalty still didn’t change.)

I spent the most time with Fenn, naturally. It was almost like the ‘cursed lover’ thing wasn’t looming over us, though she left the room whenever Amaryllis wanted to talk about it with me, and sometimes I felt her clinging to me when we lay together. We didn’t discuss it, because she didn’t want to, and not talking about it really did help her mood to improve, so maybe that was just how Fenn dealt with things. If we’d been on Earth they would probably have said, “Oh my god is that an elf?”, but after they’d gotten over the half-elf thing, they would have said it wasn’t a healthy way of dealing with problems. The problem was, I knew as much as anyone that you couldn’t drag someone, kicking and screaming, to confront things that needed confronting.

(At the end of our week off, the narrative theory was still looking inconclusive, and even if it hadn’t been, the ‘dead lovers’ pattern was also inconclusive. The problem was, nothing actually seemed like it was dictated by narrative, it all seemed like just a natural consequence of what had come before, and that was even more true with the women in Uther’s life than with the threats he faced down as King of Anglecynn.)

Eventually, I grew to value how Fenn walled things off. As much time as I was spending on training, reading, and discussing theory, it was nice to have someone who at least put on a front of not caring about what was going on. My time spent with her was largely time not spent thinking about serious things, and with the ward against noise around our alcove we were able to have some fairly intimate talks.

Fenn’s side of it was mostly relating stories of her times in the Risen Lands, occasionally interspersed with the colorful characters she dealt with in the course of selling off what she looted. These weren’t necessarily the happiest times in her life, but they were the safest, because while they had happened to her, they weren’t actually all that personal. That’s not to say that they were vapid or content-less,
but Fenn was sharing without actually sharing, talking without revealing herself. (It took me a
damned long time to actually realize that, and several false starts when I’d asked her about her
parents, or what it had been like to grow up split between those two worlds, questions that she
dverted away from pretty quickly.) So I heard a lot about killing zombies, wall crossings, shady
merchants, and nothing that told me anything about Fenn I didn’t already know.

When I shared, I tried to keep it away from D&D. I never mentioned Arthur, even when he had been
a part of the stories, partly from my usual aversion and partly because he was real, in this world, and
talking about him meant talking about Uther. So instead I mostly told her about Earth, describing all
the wonders that she would (probably) never see. All of it paled in comparison to Aerb, but that was
because all the pieces of Aerb that showed my hand were exaggerated or magnified versions of the
things and places I had seen. The one exception was the technology, but while technology and its
effects on society were a hobby horse of mine, and she seemed willing to listen, I didn’t really think
that was why she liked me, and felt awkward going on about that kind of thing. I told her as much,
while we were resting together one night.

“I like all parts of you, Juniper,” she said as she gave me a pat on the chest. “If you want to talk
about the Eisenhower interstate system, I’m happy to listen.” She gave me a contented sigh. “I think I
would like Earth, even if parts of it seem lame, and even if you have nuclear weapons all over the
place. We could go to a McDonald’s together.”

“Please let McDonald’s not be the only thing that you’ve taken away from what I’ve told you,” I
murmured to her.

“Juniper, they have a hundred billion served, you have to respect that,” muttered Fenn. Her
conversation always turned to muttering as she was falling asleep, and sometimes she would go
minutes without saying something before lazily picking a thread of conversation back up again, only
to fall asleep in the middle of it.

During our tabletop games she played Adnarim, a slink-thief and assassin who had accidentally
found herself in the semi-reputable business of taking on odd jobs from people. (Fenn had made
herself the identical twin sister of Amaryllis’ itinerant scholar, Miranda, which had initially drawn
some complaints from the princess but ended up being a lot of fun.)

And that left Amaryllis, first of my companions, and by far the one I’d fought the most with. Our
time was mostly spent focused on one thing or another, either with sparring, training, our work going
over the so-called narrative patterns, or giving each other overviews of the things that we’d been
reading. I was almost never alone with her, and even when we were alone, it was never private,
because the house was so open. I had things that I wanted to know but which I didn’t want to ask
about.

I woke up one morning and climbed out of bed to see her sitting at the desk, using colored pencils on
a revision to the map of Uther’s life, which consisted mostly of arcs as various conflicts sprang into
being and were later resolved. We had both taken note of the largest thing that stood out: there were
precious few ‘plots’ or ‘narrative arcs’ that Uther had left behind when he’d disappeared, but the
reason for that eluded us. She had been gearing up for us to move on to the next part of our
adventure since the day before. This, then, was her final map of Uther’s life, the one that she could
carry with her and consult, the distillation of several days of research.

“Looking good?” I asked after I had passed through the invisible sound barrier. I usually woke with
the sun, but Fenn stayed in our bed for another hour or two after I’d gotten up.

Amaryllis glanced at me and frowned. I was in my boxers, and behind me Fenn was naked. “You’ve
“Have I?” I asked, looking down at my bare chest. I could tell at a glance that she was right, but I didn’t really need her to confirm it for me, because I had noticed it myself two days ago. Losing weight, in this context, was not at all a good thing. Leveling up had reset me to essentially the best physical condition of my life, and the weight that was coming off was, almost by necessity, all muscle.

“Have you been eating?” she asked.

“Yes,” I replied, hearing how defensive I sounded even as I said it. “You hear Fenn coaxing me at every meal, even when I’m eating.”

“She’s worried,” said Amaryllis. “I worry too.” She looked back down at her colored map of Uther’s story. “If I had no desire to eat but it was necessary for the survival of myself and my party, I would endure the unpleasantness and force the food down.”

“Not very subtle,” I said.

“What?” asked Amaryllis, looking up at me with a furrowed brow.

“Sorry,” I said. “I thought you were … making a reference.”

“Oh,” said Amaryllis. “That. No, I was just saying that … you can’t depend on a level up again,” she said. “Unless we face a rapid series of substantial threats, or a number of quests that are easier than they appear but still rewarding in spite of that, we’re probably looking at weeks, not days until you get another one. You’re losing muscle mass, which means that you’re losing combat ability.”

“I know,” I said. “I’ll … have you considered that it might be that my digestive system is malfunctioning and I’m just not taking in nutrients? I feel like I’ve been eating a lot.”

“Then it’s worse than we thought,” she said with a mild tone. “We need someone who can repair the damage you did to your soul, but it’s a profession far more heavily regulated than most. More to the point, we need to find someone trustworthy. Unless we can stumble our way into another companion whose specialty is exactly the thing that we need, we’re left with either going to someone reputable and hoping that we can bribe them into silence, or going to someone disreputable and hoping that they don’t fuck us over.” She was thinking of the tattoo mage, I was sure. “Of course, if we find someone that we can bribe, that means that they’re inherently untrustworthy.”

I glanced over at the blue amulet laying on the table next to her. She normally kept it tucked away. I had seen her in conversation with it a few times now, a process that, from my end, looked like her zoning out with glowing blue eyes while the temperature in the room dropped a few degrees.

“Any answers from your great-grandfather?” I asked.

“He’s very frustrating to speak with,” said Amaryllis. “Actually … he’s an asshole. The relationship between us is not of an ancestor helping his descendant, but of a man attempting to exert his values on the world from beyond the grave.”

“Are those values terribly at odds with your own?” I asked. I’d been under the impression that the ghost of her great-grandfather was being overly cautious, rather than that they were adversarial.

“He was a supporter of the Second Empire,” said Amaryllis.

“Ah,” I said. “Yes, I can see how that might complicate things. Did he have any advice though? If
they were known for their soul work, then maybe he has something worth sharing?’”

Amaryllis frowned and looked down at the amulet. “If I tell you, and it appears as a quest for you, then can we agree that we will have a long conversation with the others and not decide on it as a good course of action simply because the game said so?”

“Were you planning on not telling me?” I asked.

“No,” said Amaryllis. “I’m trying my best to be an open book. I just wanted some time to mull it over before presenting it, ideally to everyone.”

“Oh,” said Amaryllis. “Right, yes. There were counter-imperialists in most of the member nations, and with the Empire effectively decapitated, and many of the imperialists crudely enslaved by Manifest, there was a rapid shift in power. My great-grandfather managed to hold on and avoid any of the criminal trials that Anglecynn went through, but others weren’t so lucky. One of them was Fallatehr, a soul mage, who was imprisoned with a few others on the smallest of the Zorish Isles -- technically not part of them, but under their dominion. He was an elf, so he should still be alive, but the prison is abandoned.” She paused slightly. “Obviously it would be suicidally stupid to stage a prison break in order to gain his expertise.”

“Do you actually believe that it would be suicidally stupid, or were you just saying that to help trigger the quest?” I asked. “I did get the quest, by the way.”

“I think it’s ill-advised,” said Amaryllis. “We still need to find out what the national apparatus of Anglecynn and international systems of the Empire think of us, but … if we were implicated somehow it would almost certainly cement our reputation. I think the risk of implication is low, but it’s still a consideration.”

“What about as far as feasibility?” I asked.

“We have a teleportation key,” said Amaryllis. “That’s the only reason I think it could work. The penitentiary on Sulid Isle was built by an architect under forge frenzy, it’s a treacherous place with dangerous, unknown magic. The only people sent there were sent for life. Once Anglecynn began the program of final trial by adversity, it stopped being used entirely.”

Amaryllis nodded. “Sentient.”

“We’ll stick a pin in that then, and get input from the others,” I said with a frown. Short of going to one of the Empire’s licensed soul mages though, I didn’t see that questline as having many other promising avenues. “I don’t feel like Solace will be happy about it.”

“She will, if it’s the path to saving the locus,” said Amaryllis. “Happy is probably the wrong word. She’ll accept it, I think, if we decide that it’s the best path forward. We’ll have to talk about it with the full group.”

I stepped toward the papers she had laid out. “I wish we had more to go on,” I said. “More of substance, anyway.” I looked back toward Fenn. “How much danger do you think she’s in?”

“I have no idea,” said Amaryllis. She laced her fingers together and stretched them behind her head. “There was always a reason it happened. There were three of the twenty that we might chalk up to bad luck, but for the others, there was always a reason, it wasn’t obviously supernatural. You keep asking how he could keep putting people in danger, and it just doesn’t look like fate to me. Elf luck at its upper extremes is visible, it’s almost tangible, one in one hundred odds happening nine times out of ten. This,” she gestured to the papers, “This is just people inexorably following their beliefs and incentives, coming into conflicts that are predicated on and resolved by basic facts of reality. It’s not about being in the wrong place at the wrong time, it’s just … how things had to happen.”

“That’s what makes it so insidious,” I said.

“I don’t like it,” said Amaryllis. She brought her arms down and crossed them. “It implies omniscience, or omnipotence, or both. If the Black Expropriates embedded an agent within the Milue parliament for internally coherent reasons, then how can that all be a setup for Uther’s arrival three years down the line? How can that be a planted romance subplot that naturally results in her death?”

“I’m more surprised that it’s exposed to us,” I said. I looked back at Fenn, who was still asleep, slightly slack-jawed. “Though maybe it’s meant to be a warning, or a lesson, or a clue. Or maybe there’s nothing to the narrative theory, and Uther just,” I threw my hands up, “Maybe this was all just a result of his beliefs about narrative.” Ironically, that would be a pretty ironic twist.

“Maybe,” nodded Amaryllis.

We both looked at the paperwork in silence. Today, it would all be packed up and then stuffed into Fenn’s glove, most likely never to be seen again. We’d spent time and effort on it, but it all seemed like it was essentially for nothing, because if there was such a thing as a proper narrative, then we had no idea how to defeat it.

“We could try manipulation,” said Amaryllis. “If we assume that narrative is desired from us, we could act in more dramatic ways.”

“We’d be acting,” I said. “It would know.”

“You think it’s that powerful?” asked Amaryllis. There was something different about her, and it took me a while to realize that it was the touch of fear.

“No,” I said, “I don’t know,” I added, because I was a terrible liar. Obviously the Dungeon Master was that powerful. “Trying to avoid destiny never works out in stories. At best, you can subvert it, but this isn’t even destiny, because it’s not diegetic. Or, it is now, now that we’ve noticed it, but I don’t know if that counts. No, we’re going to continue on and not try to game the narrative.” I looked to Fenn again, like something might have happened to her in the five seconds I had looked
away. “If it were me, I wouldn’t want someone trying to game the story I was telling.”

Amaryllis nodded. “Was that why you killed me last night?”

It took my mind a moment to jam up in confusion and then switch gears; she was talking about our tabletop session from the night before. “Was that why you put Miranda in harm’s way?” I asked. “I thought that was a character moment, showing that you really loved your sister, that kind of thing.”

Amaryllis was really good at getting in character, which at first surprised me, until I thought about it for a bit.

“It was both,” said Amaryllis. “I thought that I would get some leniency for it.”

“That death was kind of a result of how I set up the rules,” I said. “Normally the GM can roll some dice behind a screen and then fudge them if he really, really has to, but we only had the deck of cards, and it was split with a suit for each of you, meaning that I had to make it so that you were flipping cards against a static number for attack and defense, which … I couldn’t change the outcomes in a clean way.”

“You could have,” said Amaryllis. “You said that Rule 0 was that the Game Master superseded the rules. You could have said that the mortling missed.”

“It would have been obvious,” I said. “The game has rules, everyone had read them, so violating them would be violating this sacrosanct contract between gamemaster and players. It would be saying that grand gestures matter more than reality. I would have fudged it, if I could, but …”

“But it was important that the cards dictate what happened,” said Amaryllis. “Or else the illusion would be broken. Thank you, I think that was enlightening.” She looked back to the papers.

I wasn’t sure quite what enlightenment she was talking about, but part of the reason we had played those games was so that I could explain to them how tabletop narratives were different. I might have asked what she was thinking, but Fenn finally got out of bed, and that was more or less the end of talking about narrative.
We entered into Anglecynn by teleportation key, fully armored and geared up for a fight, but we were in the woods that the Penndraig clan sometimes used as hunting grounds, far out of season, and the only creature that marked our arrival was a very surprised bluejay. I spent some time putting a tattoo on the back of Amaryllis’ hand for the teleportation key to go in, placed so that she could pull it out swiftly. When she put her leather gloves on, there was no way to tell she was hiding something so valuable on her person. From there Solace turned us into seagulls, and we flew in a loose formation toward the nearby sea, out to the line of tall islands on the horizon.

Our conversation on next steps earlier in the day had mostly consisted of Amaryllis giving as much information as she had, and everyone agreeing that the prison break was going to be our next step, largely because I was (perceived as) deteriorating. More than that, Solace wasn’t convinced that a registered imperial soul mage would be capable of doing what we needed, especially with regards to the expertise necessary to manipulate the locus. Her two conditions were that we attempt to barter with him first before springing him, and that he not be allowed in the bottle or informed that she was a druid, both of which I thought were perfectly reasonable.

The five main Zorish Isles stuck up from the Brylyg Sea. To say that they weren’t natural would be a severe understatement; each was the tip of an enormous finger sticking up from the perpetually cold, dark water. When I’d drawn them up, they had been inviolable, stone so hard that not even diamond could scratch it, ancient things that suggested an entity of supreme power, dead and buried beneath the waves. I’d come up with them when I was sitting in a bathtub, sticking my fingertips up from the water just enough to have them be exposed to the air. But very few things I’d created survived contact with Aerb, and the Zorish Isles had been at least partially excavated using voidtools before the imperial ban. None of that was visible from a distance; instead, it was greenery, most of it cultivated, and cities built into the side of the isles, largely confined to the whorls of the fingerprints to maximize arable land on top.

Sulid Isle wasn’t technically part of the Zorish Isles, it was just close enough to them that they had control over it. On first hearing about it, I thought that it was inspired by Alcatraz, but it was far bigger than that, with less development, and probably took more inspiration from one of the islands of exile. It was mostly barren, but there were spots of green, and at the center of it all, an enormous compound with high walls and a singular building that looked, to me, like a mansion. No one ever came to this place, according to Amaryllis, and the vast majority of the prisoners would probably be dead from old age, because the sentient, magical penitentiary hadn’t been used for that purpose in at least a hundred years, if not more.

The day was dark and gray, and the winds were uncomfortable on my wings, so I was happy to land at the island’s edge and turn back into a person with armor and a fur cloak against the chilly wind.

We were at least a mile away from the penitentiary, but it still loomed large, rising ten stories high and built with what seemed like a very surprising amount of glass, given that it was a prison. The glass looked dark blue in the diffuse light of the cloudy sky, but the ribbing was brass or something like it, which gave the building a grandiose cast. It had dozens of domes, with a large one at the center that dominated the entire structure. Even the walls that surrounded the compound were ornate, with sculptures topping regularly-spaced towers.

Grak raised his warder’s monocle to his eye for a moment, then set it back down. “The building is magical,” he said. After a moment, Fenn began to laugh, and while I didn’t find it funny at all, a slight smile crossed Grak’s lips, so he must have meant it as a joke.
It had been built by an architect in a forge frenzy, a man possessed by the urgent need to build this thing he didn’t necessarily understand, and given funds to do so by a government that was all too willing to pour money into a frenzy if they could reap the results. The building was sentient, to a higher level than Ropey was, but there were other bits of magic as well, defenses and systems that kept its prisoners in, not all of which were known to us.

I looked at the grass around us, and could just barely see the areas where foundations had once stood. This place had been lived in, once, though it had little in the way of natural resources, and aside from the prison, there wasn’t much point to anyone living on it. With the prison abandoned and entirely autonomous, my guess was that there was a feedback loop of people leaving, which caused a collapse in services, which caused more people to leave, until everyone had gone back to either Anglecynn or the Zorish Isles.

Solace tapped her staff once on the ground and over the course of half a minute, various small birds began to flock to her. She didn’t send them out at once, but instead turned her staff sideways and rested it on her shoulders, where the birds patiently waited.

“We’ll fall back to here if this doesn’t go to plan and we get separated,” said Amaryllis. She was dressed in her immobility plate, with her helmet held in one arm. Her emotional mask was as firmly in place as it had been before our vacation, hiding tension, doubt, and fear, leaving only serene, iron will. I still didn’t have a good model of what it was like to be Amaryllis, whether she was forcing everything down, whether she was just acting like she was forcing it down, or whether those emotions were like cloaks to be worn if needed.

“I don’t want to run at the first sign of things going south,” I said. “We might have to fight, but so long as it’s a winnable, recoverable fight, I don’t want retreat to be our watchword.”

“Sometimes you don’t know the fight is unwinnable until you’ve lost it,” said Fenn. Most entads had some minor ability to repair and restore themselves, but her armor had been a total loss, and she was in the same fatigues she’d been wearing when we first met. Save for the glove, and slightly longer hair, she looked almost the same. It was weird to feel nostalgia about something that had only happened a month ago, especially since it was at an objectively awful point in my life, but that was what I felt.

“We’ll hope that it doesn’t come to a fight,” said Amaryllis. “The penitentiary should be reasonable. It didn’t allow much in the way of outside influence over its interior space, but it did allow visitors, and some level of negotiation was possible.”

So far as we knew, it wouldn’t allow visitors with weapons; those we had mostly because the penitentiary had a reputation for being unruly even when it was being used as a functional prison, and it wasn’t clear what more than a century of isolation would have done in terms of changes in personality or drift in alignment, both apparently real concerns when it came to sentient magic items (or buildings). That made this whole mission dangerous, but in theory it could be as simple as walking in, sitting down to have a visit with Fallatehr, and getting enough information that I could unlock some kind of soul magic skill without actually having to break him out.

So we approached, walking slowly, stopping every once in awhile so that Grak could check for unseen magic, and then continuing on. The statues at the top of the tower walls all had their heads turned toward us, and as we approached, they tracked us with open mouths. Based on that, I assumed that these were some kind of active defense, though this was one of the areas where our knowledge was thin. I wasn’t counting on the game to throw us level-appropriate encounters, but I was hoping that it wouldn’t just perfectly set us up to walk into a TPK. The penitentiary was supposed to have a strong preference toward less-lethal means. (I don’t want to play the politically-
correct-semantics game too much, but there’s a huge difference between the implications of ‘non-lethal’ and ‘less-lethal’ when you’re staring down a thirty-foot tall golem.)

We found ourselves staring down a thirty-foot tall golem with metallic eyes, who stood as the gate of the enormous wall around the penitentiary. Not at the gate, as the gate; there was a simple gap in the tall, decorated wall, and the golem sat there with his two giant fists pressed against the earth, perfectly blocking the entrance. The wall had overlapping metal scales, not in a set pattern, but with curves, coils, and flourishes. The whole thing looked like it had taken thousands of man-hours to finish. By contrast, the golem was simple, with the kind of detail you’d expect on something carved out of wood in an afternoon. Unless my eyes were deceiving me, I was pretty sure that it was made of tightly-packed dirt, held together by who-knows-what magical energy. The eyes were the only thing different, giant, perfectly-reflective orbs that spun to follow us. We stopped a hundred feet away.

“Friendly-looking chap,” muttered Fenn. “Grak, is he magical?”

Grak raised his monocle quickly and lowered it. “Same base magic as the walls and building,” he said. “It’s part of this place.”

“You were supposed to deadpan it and tell us that it’s magical,” said Fenn.

“Sorry,” said Grak. He turned to Amaryllis. “I was given the impression that autonomy did not include fully mobile agents. It was supposed to accomplish its goals through internal systems.”

“We don’t know if it’s fully mobile,” said Amaryllis. “That’s a good guess though. If so, this wasn’t what we expected. Do we need to re-evaluate?”

“I’m in favor of continuing on,” I said.

“Second,” said Fenn.

“Third,” said Solace.

“Grak?” asked Amaryllis.

“Amaryllis,” answered Grak.

“Keep going, or re-evaluate?” asked Amaryllis.

“We’ve already got a majority,” said Fenn. “Let’s not undermine our democracy.”

“Grak is the expert in defenses,” said Amaryllis. “That also means that he’s the expert in threat analysis. I want to hear what he has to say, rather than just taking a vote and not thinking.”

I felt a little bit of sheepishness at that. I thought that I had been thinking. We’d assumed there might be some amount of drift, and the information that we had was rather thin, so this wasn’t very suspect as yet.

“What do the winds and birds tell you?” Grak asked Solace.

Solace squinted. “Not much lives in there,” she said. “It’s hard to get a sense of it. I could ask one of my bird friends to take a look,” she nodded to the small birds that lined her staff, “But I wouldn’t want to anger this place.”

“Do it,” nodded Amaryllis. This, I noted, she did not put to a vote. She had been trying, but her
default state was one of command, and it was, for her, a hard habit to break -- not that I had any objections, in this case.

Without any visible sign of having been told to, one of the tiny birds flitted off from Solace’s staff and zipped across the distance, up and over the wall. One of the statues on top of the walls spun its head whip-fast, paused for a second while making a high-pitched whine, then shot a thin green laser from its mouth, which pierced the bird through and sent its flaming body tumbling down. The statue turned back to face us, mouth aimed right at us, as all the statues had been since we’d been close enough to see them.

Fenn coughed politely. “Is it too early to make a joke about that bird’s place in the pecking order?” she asked. I could see her eyes moving quickly from statue to statue, and the way she held her gloved hand, open just wide enough that she could have her artillery bow in it at a moment’s notice.

“Hopefully that will be interpreted as a test,” said Amaryllis.

“That was a test!” Fenn called to the gate-golem. It showed no response.

“We could fly to the Zorish Isles and try to get more information there,” said Amaryllis. “I know that Joon is in failing health, but we took the time we needed for research before going after the unicorn. If those statues are turned on us, I don’t like our odds.”

“I could send more birds,” said Solace. She sounded less pained over the idea than I would have thought, but after watching her with the flowers, I already knew that she didn’t have that much aversion to crimes against nature.

“One is a test,” said Amaryllis. “I worry that more will be seen as probing for weakness, because they would be.”

“There was a one-second pause,” said Grak. “That’s something. It would help to know how long before it can fire again.” He lifted his monocle out of its pocket. “Two more birds. Then I should be able to ward against it.”

Solace grimaced slightly, but two more birds flew off from her staff toward the wall. This time the statues were proactive, and turned toward the perceived threat before the birds had even crossed the wall. The birds flitted and twirled, and managed to dodge the first and second shots at them before being taken down by the third; the laser-fire came from all four of the statues within range, again with a high-pitched whine as they charged. When both birds had crashed to the ground, flaming, the nearest statue to us turned our way and fired at the ground a foot in front of Solace.

“Well, that was our warning,” said Amaryllis. “Grak?”

Grak lowered his monocle. “A one second pause before firing. Three seconds between firings. That’s a feint; the true refresh is faster. If given time I can ward against the effect.”

“Which might provoke them,” said Amaryllis.

“I think we should talk to the gate,” I said, nodding in the direction of the huge golem (and wondering, idly, how many experience points it might be worth if we were forced to kill it). “Where we are now, it’s pretty clear that we’re not safe anyway.”

We moved up, slowly, watching as the metal orbs that served as the golem’s eyes turned in their sockets. I looked closer at the fists that barred our way, noting that they were exactly wide enough that not even a mouse would have been able to squeak through.
“Hail, and well met,” called a woman’s voice from the other side of the golem. A dirt-golem climbed up over the gate-golem’s back and sat upon its shoulder. It was of a similar make, but much smaller, about Solace’s size. It had more proportionate limbs, and no visible eyes or eye sockets. What it did have was a mouth set into the packed earth of its face, white teeth, pink tongue, and all. “What brings you five this way today?”

I looked at the others, and nodded at Amaryllis. Diplomacy was her thing, not mine, and I was hoping that was one of her skills that had increased through Twinned Souls.

“Are you the voice of the Amoureux Penitentiary?” asked Amaryllis, raising her voice slightly to cross the distance up to where it sat.

“A voice,” the dirt-golem called down. “Have you come to visit, or to stay?”

“We hope to visit,” said Amaryllis. She touched her armored chest. “I am Amaryllis Penndraig, most direct descendant of Uther Penndraig, Princess of the Kingdom of Anglecynn.”

“Whether Uther is here, I cannot say,” called the golem.

“No,” said Amaryllis. “It isn’t Uther Penndraig we seek. We’re looking for a summer elf imprisoned here, Fallatehr Whiteshell.”

“Oh, yes, him I know well,” spoke the golem. “If you wish to come inside, you may.” The gate-golem’s hands turned and unfolded, making a pathway between surprisingly slender legs. Beyond that was a well-tended garden, with more green than we’d so far seen on the rocky island.

“We appreciate your hospitality,” said Amaryllis with a small bow. She looked at me with a raised eyebrow, and in response I started forward, leading the way.

It was impossible to tell whether there was something off about the penitentiary and its golems, because we didn’t know what state it had been in when it was fully functional. Even when it had first been built it probably had its quirks, it was basically a building-size magic item for cripes sake, and on Aerb some of those were weird, impossible things that didn’t feel beholden to concepts like “making sense”. The jar of marzipan fairies had shown that much. Maybe this place had always had golems made of dirt, and their contrast with the rest of the decor was just the way things were.

I passed through the huge hands, thinking about how easily they could crush me if given half the chance, and trying to keep on my toes, ready to move, without actually displaying distrust. I relaxed slightly when I was through, and the eyeless golem hopped down from its friend’s back to stand beside me.

“Behold,” it said, gesturing to the buildings in front of us. “A home for those who’ve gone astray.”

There were no people around, only golems, these more human-sized than the one with the mouth. Some were working with the plants, trimming plants with shears or pulling weeds, but most were just standing there, watching us, each with a single, silvery metal eye. They weren’t quite surrounding us in a defensive semi-circle, but it was close to that. Figuring out their combat abilities on the fly while dodging laser fire wasn’t something I had much of a hankering for.

I hadn’t been divested of my sword yet, which was a plus, but at the same time, that said some worrying things about the laxness of security. We wanted security to be tight enough that any remaining inmates who hadn’t died of old age wouldn’t be a threat to us, but also loose enough that we would be able to steal a prisoner from inside. That was a pretty fine line to walk.

“I’m not really liking this,” said Fenn. “There’s just something about having heavy weapons aimed at
me that makes me nervous."

“Spider sense tingling?” I asked.

“If it was, I wouldn’t be standing here jabbering about it,” said Fenn.

We stood there for a moment, but the ‘voice’ of the Amoureux Penitentiary didn’t move. After a
time, it began to hum a gratingly dissonant tune.

“Is there something that we’re waiting for?” asked Amaryllis.

“Your desired prisoner was within the gymnasium,” said the golem. “We wait for him to be moved
to visitation, where you may make parlance with him.” Its speech-patterns had switched following
the period of silence, which made me more nervous than if it had continued on with the same
awkward cadance it was using before. A predictably broken intelligence I thought we could handle,
but an unpredictably broken one I was less sure about. Variations in speech like that didn’t
necessarily mean anything about the mind (or mind-equivalent), but they were suggestive.

“Are there any restrictions on visitation?” asked Amaryllis.

I reached over and quickly placed my hand over Fenn’s mouth when I saw her about to say
something, because I’d seen the look in her eyes that usually meant she was about to make a joke.
She smiled at me and licked my hand, but otherwise seemed content enough to have been
preempted.

“You will engage in conversation with the prisoner for four hours at the upper bound,” said the
golem. Up close, its mouth was disturbingly human; it didn’t just have a simulacrum of a mouth, it
had all of the interior musculature, membranes, and teeth that I would have expected. Maybe some of
that was necessary to actually create sound (which implied lungs, a diaphragm, etc.), but it seemed
like overkill, especially given that magic existed. “You will be diverged from him by a complete
ward, save for the transfer of sound between your mouths and ears.”

And that didn’t speak terribly well to our ability to remove the soul mage from prison, nor to giving
him something that he wanted in exchange for a few lessons. But if we left this place having learned
little and only wasted half a day of our time, then I would probably still make a mark in the win
column. Doing something risky and having it come to nothing was, to me, a pretty acceptable
outcome.

A dirt-golem came out from the largest doors of the main building, pushing them open only slightly
to come through. It moved toward us at a brisk walking speed, singular metal eyeball focused our
way. I noticed another dirt golem move to the door and use a cloth to wipe away the dirt left on the
handle; that sort of care was probably why the outside space we were in was immaculately clean.

The dirt golem stopped close to us and gave a slight bow.

“The prisoner had a missive that he would like to relate,” said the golem serving as our guide, the
voice of the Amoureux Penitentiary, “He could not relate it in a language that I could pass on, so
inscribed it upon this --”

“Okay, I kick the door open,” said Arthur.

“Alright, where is everyone standing?” I asked.

“Fuck,” said Reimer.
“Well don’t say *that,*” said Greg, “Then he knows that you’re going to try to game it.”

“I already knew that,” I said. “But if I had asked for your positions as you approached the door, then you would know that something was up.”

“Yeah, like how in old cartoons the cel-shading let you know that some particular bit of rock was going to move and wasn’t part of the background,” said Arthur.

“So place your figs,” I said, gesturing at the dry erase battlemat. “But do it as you would have *in-character,* and I will remind you that no one was taking this seriously as a threat, so you can’t retroactively have been on high alert and optimally positioned for a trap and slash or encounter.”

The dirt golem that had come forward from the main building began unfolding its hand as the other spoke, and Fenn moved in front of me a half second before I saw the small purple crystal it was holding in its hand. Time seemed to go slower then, as my mind first recognized it as a void crystal, then made sense of it as a threat, and finally parsed that Fenn had moved in front of me. Amaryllis and Solace were both further in front of me, close to the main entrance, and both were moving in different directions, but Fenn was shielding me with her body, and I couldn’t let her --

A solid steel wall popped out from her outstretched hand and the soft, subdued whump of the improvised void grenade happened just after that. The first thing that I heard was Solace screaming in pain, and then the high whine of the statues charging to fire. Fenn lunged backward and put up another wall of steel behind us, as I reached for one of the bones in my bandolier and pulled down as much SPD as possible from it. I was up and moving as soon as the whining sounds stopped.

Solace was slumped on the ground, dark green blood pooling around her. Most of her back and legs were missing, exposing bone and muscle. Amaryllis was unhurt and racing across the grounds, toward the mass of dirt-golems that were moving toward us, her helmet now firmly in place and the blade of her sword flickered into existence. She was bleeding from the leg, where a substantial fraction of her armor had been removed; the last I’d seen of her before the blast, she had been moving behind the dirt-golem that had been speaking to us. Grak had been the straggler, further away from us, and he trundled his way toward the barricades that Fenn had set up. He was bleeding from two places, but not as heavily as I would have feared.

I ran to Solace and pulled her body behind the makeshift barricade, leaving a smear of her dark green blood on the flagstones. Her skin had been transformed into hard bark, but if that was what she’d tried with druidic magic, it had apparently not helped her. She had moved her cloak around and clutched it to her chest in order to shield it with her body, but she was either unconscious or dead, and either way wasn’t holding onto it anymore, so the cloak of leaves trailed after her, becoming bloodied in the process.

Fenn fired an artillery shot at one of the statues, using heavyweight, blunt arrowheads, then ducked back down behind the barricade with us as the whine of the statues picked up again. I pulled more SPD from one of the bones and left again, this time moving toward where Amaryllis had engaged the dirt-golems in combat. Her sword was flickering rapidly as she spun and ducked through them, and with her every movement she put more of them between her and the statues.

“Aim for their centers!” she called as soon as she saw me.

“We have to go!” I called back, even as I waded in with the Anyblade.

It was my first time actually fighting with a blade since I’d gotten the new blade-bound bonuses, and the difference would probably have been overwhelming if it wasn’t all muscle memory. The dirt
golems were mostly unarmed, throwing punches or trying to grab at me, and I danced between them with fluid motions, nimbly avoiding them and striking out with my sword at all the opportunities that seemed to be presenting themselves. I could tell that the dirt golems hadn’t been built for combat just from how they moved, but there was a huge amount of weight behind their swings.

When my sword cleaved into them, it stuck into the dirt, and I was only able to remove it by quickly shrinking the Anyblade to pull it out and then expanding it back to its full size again. Amaryllis was having more luck than I was; the ones she was fighting had dark brown liquid leaking from the holes she was putting into them, and a few had already dropped around her. I switched up my tactics and began using the Anyblade in its largest form; Monkey Grip applied even when wielding two-handed, which meant that I had what should have been an impractically enormous six-foot sword. I swung it through the air like I had been born with a blade in my hand, and when I struck one of the dirt golems with a full swing, my sword went halfway through its body, causing a thick spurt of dark brown liquid as it collapsed to the ground.

**Basic Dirt Golem defeated!**

After that, my new strategy was to duck and roll out of the way, getting enough distance that I could wind up for a huge swing with the massive sword. The dirt golems were either too slow or stupid to dodge; the best they could do was to put up an arm in defense, but a burst of blood magic to enhance the force of my swing was enough to both cut off the limb and strike to their heart. The power of it left my right hand shaking with pain -- I couldn’t feel anything from my left. The messages kept piling up, not just from the golems Amaryllis and I defeated, but from skills going from 20 to 21 and hitting that cap.

I took a few hits. The golems had been converging on Amaryllis and I from all directions, and sometimes it was simply a matter of needing to take the hit or be overwhelmed and unable to continue with the power strike strategy, which required a fair bit of room. Each time, the hit was absorbed by my armor, leaving the blue metal a bleach-white but otherwise not affecting me at all. Twice I was struck with a laser, but it only left a small white mark on the metal. Amaryllis was taking hits too, but less gracefully; she could lock her armor in place, but that wasn’t an absolute proof against the impacts, and every time she did it, she was stopping herself dead in her tracks, unable to dodge or attack.

It became a slog, but one that we were winning, and there was a feedback loop of victory, where each golem defeated meant that it was easier to defeat the others, even as I began to grow exhausted. I glanced to Fenn and Grak and saw a dirt golem slam his fist against an invisible wall just before Grak buried his axe in the creature’s torso. Grak wasn’t nearly as effective as Amaryllis and I, but he was fortified. Three of the four statues in range were gone, and as I watched, Fenn fired another artillery shot at the fourth. The arrows struck hard enough to chip and crack the stone, and while the statue didn’t quite topple to the ground, it stopped in place with its mouth wide, no longer shooting lasers down at us.

Then I swung my sword again, dropping another golem to the ground,

**Basic Dirt Golem defeated!**

and that was it, we had killed everything there was to kill. I glanced toward the gate golem, but it hadn’t budged, save to close its enormous hands.

I ran to where Fenn and Grak were and knelt down to look Solace over, a hand already going to one of my few remaining bones. Her skin was no longer bark, having reverted back to its natural light green.
“She’s dead,” said Fenn. “Has been since you brought her here.” I could see dark green crantek blood on Fenn’s hands and staining her fatigues.

“A person isn’t dead until their soul is gone,” I replied, “We’ve got thirty minutes to think of something, we can put her in the bottle, --”

I reached down and undid the leafy cloak around Solace’s neck, put it around my own neck, and once it was in place, reached into it as though absentmindedly drawing something from a pocket. To my relief, my fingers found the bottle and pulled it out. I set the bottle, with the forest inside it, down onto the ground.

“We can’t put her in, Joon, there’s no magic there to catch her, nothing to stop her fall, you’d be dropping her a mile to smash up her corpse,” said Fenn.

“Amaryllis has the immobility plate,” I said, “She could --”

“No,” said Amaryllis, “I would be trapped if the locus couldn’t somehow revive her. We used her magic to get in and out of the bottle.” Amaryllis took the void rifle from her back and leveled it at Solace’s head. Thunk. “Fenn, nail and bottle.”

Fenn held out Sable and a small glass bottle with a glass stopper in it appeared, followed by a nail with runes as soon as Amaryllis had grabbed the bottle. I watched, feeling numb, as Amaryllis slid the nail into the hole she’d made and extracted Solace’s soul from her body. When that was done, both the nail and bottle went back into Fenn’s glove, and after that, what remained of Solace as well.

(And during the battle, I had actually been feeling gleeful at the way that I’d been moving, reveling in the power that was now mine, high on the rush of inflicting pain and damage, and on each message the game gave me about another one down. I’d forgotten, for minutes, that something had happened to Solace.)

“So the plan is that we blow through this place and murder everyone inside?” asked Fenn.

“We should go,” I said. “Regroup, try to …” I looked down at the bottle. The last druid on Aerb was dead, and the locus couldn’t induct another when it had such a small, tamed scrap of land to call its own. And now the bottle really was a closed system, one that seemed like it was going to reach a failure state sooner rather than later.

“The locus is going to die without our intervention,” said Amaryllis. “At the moment, we have no intervention to administer. If we leave, the penitentiary will have time to rebuild and repair. We could fight this battle better the second time, from a position of knowledge, but we’d still have to fight it again. We have clocks running against us.”

**Quest Updated: Taking Root - The world’s last druid has died, leaving the last locus severely constrained and untended. Eventually the imperfectly self-regulating cycles of life within the bottle will fail and the locus will die, unless you can find a way to remove the locus and transplant it into the wider world, where it was always meant to be. (Companion Quest)**

“Fuck,” I said.

“A careful observer would have known that Amaryllis intended us to stay,” said Fenn. “If she hadn’t, then she’d have had the key out from the moment she came over here.”

“Don’t start with me,” said Amaryllis with a glare.
“Sorry,” said Fenn with a shrug that didn’t read as remotely apologetic. “I’m in a people-murdering mood, that always gets me feisty.”

“She was a good woman,” said Grak. His eyes were fixed on the puddle of green blood. He hefted his dirt-smeared axe. “I believe she would want us to see this through.”

I stared at the three of them, my eyes flicking from one to the other. I was afraid of what we’d find within the penitentiary, given that the prisoner we were after had enough free rein to send a void bomb out to us and that the security systems, or maybe just the penitentiary itself, had been thoroughly subverted against us. But we’d been caught off-guard this time, and if there were more fights in the future -- well, who was I kidding, there were sure to be more fights in the future -- then at least those fights would be ones that we could approach on a full war footing, with no fear of offending our now-hostile host.

“We’re going to need to be on the lookout for traps,” I said. “Not just magical ones, but mechanical too. And revenge is not our priority here, we need at least enough information to kickstart my own knowledge of soul manipulation. We can’t kill whoever sent that bomb our way until after that.”

“Then what are we waiting for?” asked Amaryllis. “Let’s go.”
I tried to think about it in terms of tactics.

Solace had been versatile, able to switch between control, utility, and being a heavy hitter basically at will. When we’d fought against Larkspur, she’d taken out the majority of men on her own. She had been able to provide healing that far surpassed what I was capable of, and with her gone, a wide variety of potential injuries turned back from recoverable to fully lethal. That was especially the case if I was the one who suffered the injury. We had lost her scouting ability, easy access to the interior of the bottle, and fast travel in the form of bird flight. So tactically, I was pretty sure that I’d have to call it the single biggest loss that our party could possibly have suffered. We still had the bottle, hidden in the leafy cloak that Fenn was now wearing, but that was now nothing more than another burden.

And on a personal level? I had known her for a little more than a week, but I had liked her, even if druidic magic was a little maddening, and even if her way of seeing the world felt foreign to me, even on Aerb. I had the barest sketch of her role in the team, as something like ‘team mom’, or ‘the tempered one’, or … I didn’t know, that was the problem, and now I never would.

(There were also all the other familiar feelings that I took to be part and parcel with death, the unfairness of it, the might-have-beens, the rage against the gods, a mixture of anger and disgust at a world that allowed such a thing to happen, and a deep-down trembling sorrow that threatened to bring tears. It was impossible for me to separate out how much of that was Solace and how much was just the way that Arthur’s death had rewired the functioning of my brain. Those thoughts were burned in from overuse, scorched on my mind through nine months of thinking the same old things as I lay in bed, staring at the ceiling, and failing at falling asleep.)

“Don’t let this distract you,” said Amaryllis as we made our way to the door.

“Distract me,” I said, not liking the taste of the words. “She’s dead. I might be able to recover her, if I can work fast enough, or -- or you said that soul decay in a glass enclosure takes three years, I could figure something out in that time, how to graft one soul onto another and preserve part of her, or how to shove a soul into a body, or something, what kind of god will I make if I can’t?”

“Uther was never a god,” said Amaryllis. “He was a man. Some things were beyond him. He’s not on record as having ever raised someone from the dead, and there were people that he desperately would have wanted to. If Uther at the height of his power couldn’t bring back Vervain, then I don’t think that you’ll be able to bring back Solace, not if you only have three years, at the most, to do it.”

I wanted to lie and tell her that I had a quest, but I was a horrible liar, and that was a horrible idea for a whole host of reasons. The fact that the lie even entered into my head meant that she was probably right, I was going to let Solace’s gruesome death distract me from the things right in front of me that really needed doing, like saving the locus, or healing my own soul, or, even in the short term, doing things like paying attention to the prison and whatever horrors it had in store for us. I tried to snap my attention away from the green blood still visible on my hands and ignore the slight tremor I saw there.

We were at the doors, the large ones that the bomb-carrying dirt golem had stepped through. Grak looked them over with a monocle, but the examination yielded little.

“We don’t yet know whether the prison was tricked or subverted,” said Grak.
“Does it matter?” asked Fenn. “Hostile is as hostile does. That was my rule, last time I was in prison.”

“If it still operates according to a set of rules, we might be able to use those rules,” Grak replied. “If there are rules, we will face different threats than if someone has taken over the entire system.”

“We can’t trust anything that we’ve seen so far,” I said. “And we don’t want to count on reflexes or telegraphed attacks to protect us from another void bomb. Fenn doesn’t have an infinite number of inch-thick steel shields.”

“I have five more,” said Fenn. “The one we set up to block laser fire was practically unhurt, so call that six total. Those lasers were good against unprotected bird-flesh, but not up to penetrating steel.”

“So we leap-frog forward, one shield at a time?” I asked. “Or just pick them up and move with them?”

“Too cautious,” said Amaryllis, looking the door over. “The golems are gone now, but I would bet that this isn’t the only way in, and once we’re in the depths of this place, they can come at us from all directions at once in the least favorable possible conditions for us.”

“You want a blitz?” I asked.

“A what?” asked Fenn.

“An intense, rushing attack?” I asked. *Come on, that was one that Aerb’s creator should have had some made up reason to import over.*

“Yes,” said Amaryllis.

“No,” replied Grak. “A blitz only makes sense if we aren’t expecting traps.”

“If we expect traps and operate as such, then we’re going to get hit harder by all the defenses that we know are there,” said Amaryllis. “We’re trading defense against the known for defense against the unknown.”

“And the unknown just killed Solace,” I said. There was no good place to wipe the blood from my hands. My armor was all metal, either mail or plate, with nowhere to get passably clean. I could have asked Fenn, but didn’t, because the denial of reality was one of the ways I dealt with death.

“Grak, do you have any read on what waits for us inside there?” asked Amaryllis. “How many more of the golems?”

“The golems are different,” said Grak. “They are the same magic at a different wavelength.”

“What the fuck does that even mean?” asked Fenn. “We’re going to need to go through this door sooner rather than later.”

“Entads can change over time,” said Grak. “They can have different aspects. It is possible that there was some drift in alignment. However, there was also drift in function. If independently moving creatures are its current design, earlier designs might be more like the statues. We might also be looking at something else entirely.”

“Meaning a full spectrum of threat?” I asked.

“Yes,” replied Grak. “That’s possible.”
“Shit,” said Amaryllis. “Fine, then no -- what was it?”

“Blitz,” I replied.

“Then no blitz,” said Amaryllis. “We’ll take this slow. Fenn, let us know what you’re feeling.”

“Angry and impatient,” she answered.

“I meant in terms of luck,” said Amaryllis with a frown.

“I know,” replied Fenn, gripping her bow. “Now are we going to open this door or not?”

Grak put his monocle up to his eye and nodded. I moved forward and grabbed the handle as Fenn raised her bow, and I pulled back the door with my sword raised, expecting a fight.

Instead, we looked at a long hallway with thirty-foot high ceilings. High windows filled the upper twenty feet. Beyond that, the large, open dome that dominated the entire building was waiting. There was far more greenery than I had expected, an entire garden growing under the grey light of the overcast sky above. Nothing moved within, and I couldn’t see any signs of dirt golems either. In fact, I couldn’t even see signs of tracks across the flagstones of the floor. My eyes weren’t drawn to that though, they were drawn to the four suits of armor that lined the hallways, each of them tucked into little alcoves of their own. They were made of brass, with dark blue lining to them, holding swords but unmoving.

Those suits of armor are going to attack us,” I said as soon as I saw them.

“No,” said Grak, lowering his monocle. “They’re just decorative.”

“They’re going to attack us,” I repeated. “It’s … if you accept that this world reflects the tabletop games that I spent my life playing --”

“I don’t,” said Grak. “They aren’t magical.”

I stared at him. “But you can’t see through the metal,” I said, “There could be something in there.”

“On it,” said Fenn. She raised her bow and fired an arrow at the nearest suit of armor, puncturing straight through its torso. It didn’t leak mud and showed no signs of reacting. “Satisfied?”

“No,” I said. “It’s … there’s no magic in there?”

“It’s less than the baseline for this place,” said Grak. “The armors will not move. Entads all have their points of visible, focused power.”

“Fine,” I said. But if it were my old group from Kansas, they would have spent a half hour dismantling those suits of armor from a distance, in the same way that they would bash in the skull of every corpse that they passed, just to make sure. I could fully fathom that this might not be a trap; that would have been my style, to set up an obvious trap just for the joy of a fake out. If not for that thought, I might have objected a little bit more, because obviously, and in spite of what Grak had said, this was a trap.

We started moving and were halfway down the hallway when Fenn said, “Fuck,” and fired her first arrow. I didn’t have time to curse at Grak, because I was already moving too, extending the Anyblade to its full, ridiculous length and slamming it hard into a suit of armor just as it started moving. I dented the armor, which pitched the suit to the side, but where that kind of blow would probably have left a person screaming in pain, the armor just got up, bringing its sword up in a
smooth, practiced motion and settling into a stance that spoke to years of training.

I’d grown a little over-confident in my swordfighting abilities over the past few days, and that was made clear to me when I went toe-to-toe with a living suit of armor that clearly held a lot of expertise. I was using the Anyblade to its fullest, allowing it to shrink and grow in response to each attack, sometimes curving so that I could make a parry, but I was being forced to move quickly and unable to make much of a counter-attack, or at least, not one that could make it through the armor. And even if I did, the large dent I’d put in its side with my first strike didn’t seem to be slowing it down any.

**Amoureux Sentry defeated!**

“Decapitate!” called Amaryllis from behind me, but I couldn’t look back to see what results I could expect from that, and ‘hit him in the head’ didn’t seem like it was all that useful of advice against what was effectively an expert swordsman. I parried another attack and shrunk the Anyblade down to a one-handed sword, then touched my restocked supply of bones in their bandolier with my deformed hand. I could barely feel them, but a connection was all it took, so I waited for an opportunity and pulled down SPD at what I hoped was the right time. I thrust the sword up, narrowing it to the thinnest possible point, and pierced the armor where the helmet joined to the gorget, putting my entire weight behind it, including a rush of force from the hammering pulse of my blood.

I was rewarded with a cracking sound like wood being split, and the suit of armor tumbled backward, still moving, but imperfectly so. I leapt on it, keeping my sword lodged just beneath where I’d expect a skull to be, and bore down with all my weight, again putting blood magic into it, and that was enough for it to stop moving and drop its sword clattering to the ground.

**Amoureux Sentry defeated!**

When I finally spun back to the others, I saw Grak on the ground, bleeding from the face, Amaryllis pulling her sword from the neck of one of the suits of armor, another suit in a crumbled heap on the ground, and Fenn backed into a corner with the fourth, doing her best with a sword and shield, which was frankly not all that good. Hair was stuck to her forehead where sweat dripped down, and my brief glimpse of the fight -- before running her way -- was enough to let me know that she was relying on luck more than actual skill.

I grabbed the suit of armor from behind and threw it to the ground, then went at it with uncoordinated strikes meant to keep it down more than to do any actual damage. With it prone and me striking from above, we were nearly evenly matched, at least until Amaryllis came over and began flickering her sword on and off. It didn’t take long for her blade to intersect something vital, and it stopped almost at once.

**Amoureux Sentry defeated!**

I ran over to Grak, who was still not moving. The cut on his cheek was bad, down to the bone, but I thought it was probably what had happened to the other side of his face, which was swelling and red, that had knocked him out. He was still breathing, and I went through the bones in my bandolier one-by-one, visibly watching him improve. Concussions weren’t at all good for humans, and I assumed the same was true of dwarves, but I wasn’t sure that it was the kind of thing that healing someone with bones could actually fix.
After the fifth bone, Grak opened his eyes and started grabbing at the ground, then after seeing that it was just us, sat up and rubbed at his head.

“You should have fucking listened,” I said as I moved away from him and over to Fenn, who was nursing her wounds and waiting for me. She pulled bones from my bandolier and replaced them from her glove as I worked. I left a smear of green blood on her and felt the sudden need to collapse in a puddle. I kept on going through force of will.

“I should have listened,” said Grak from behind me, “I apologize.”

“We could have dealt with that whole fucking mess without risk,” I said, turning on him and jabbing a finger in his direction. “We just wasted time and resources because you refused to see what’s been in front of your face this entire time, the thing that I’ve been trying to tell you, and because everyone treated you like a fucking authority, because I didn’t put my foot down, we almost died. I saved your fucking life. It’s adventuring 101, every statue is going to come to life, every suit of armor is going to move, you don’t leave that shit lying around, it’s the same thing with corpses, you put a hole in their head as you go by so that they don’t rise up as zombies --”

“Joon,” said Fenn.

“I know,” I said, “We don’t use the Z word.”

“You’re being an ass,” said Fenn. I turned to look at her. “He’s not going to say it, because he was wrong, and Mary’s not going to say it, because she doesn’t want another fight with you, which means that it falls to me to tell you that you’re being an ass. And I love you, but you’re being an ass.”

I took a steadying breath. “We could have died,” I said.

“I apologize,” said Grak. “Aerb should not work the way your games do.” He sniffed slightly.

“Well, it does,” I said. I almost gave one of the suits a kick to let out some frustration before remembering that I was wearing sneakers and it was hard metal.

Grak was right though. Most of the time, a statue was just a statue, and a suit of armor was just on display as a status symbol. It was one thing to say that the world shared a lot of similarities with the games that I DMed, and another entirely to say that it was fundamentally warped around me to conform to the conventions of the genre, and not just the standard conventions, but the conventions as I saw them. I could understand that as a hard pill to swallow. If you didn’t buy that, then it fundamentally didn’t make sense to believe that these particular suits of armor were going to animate, or at least it didn’t make sense to believe it at a higher rate than suggested by the other evidence.

“Why were they dormant?” asked Grak. He asked it in my direction, like I would have a clue. “Why didn’t they run out to attack, if they were mobile?” I couldn’t tell whether he was trying to mount a post facto defense, or if this was him genuinely seeking the solution to a problem. I choose to rein in my frustration and pretend that it was the latter.

“I don’t know,” I said. “If I were forced to guess, then … huh.”

Well, because if you were making a proper dungeon, which this effectively was, then you couldn’t just have the party fight everyone all at once, you had to split it up into a large number of roughly level-appropriate encounters, because otherwise there would be a long slog through a mountain of enemies followed by looting the place blind, and proper game design dictated that you give as much variety as feasible so that when people got bored of the fighting, there was a puzzle, or a social
encounter, and these were layered for optimal enjoyment.

But if you just had each room be its own encounter, then people would naturally wonder, “Well, why didn’t they hear the fighting? Why, when responding with overwhelming force seems like the winning strategy, would they not do that?”, and there were plenty of answers to that, but there did have to be answers, unless you wanted to be the kind of coward who threw up your hands and said that it was just a game.

“You said that entads could change over time?” I asked Grak.

“Yes,” he replied. His eyes were scanning the large dome and looking at the greenery there. Standing in this hallway wasn’t making any of us feel great, but focusing on a problem was helping me to cool down a little bit, and I was hoping that the same would be true of Grak. “Most entads are static, but some change. It’s more common for sentient entads to change.”

“Then my guess is that either there are independent parts of the prison working at cross-purposes, or parts of it that were set up long ago that the prison has diverged away from. The statues outside are of a different make than the dirt golems, it’s possible that they operate independently from each other.” I paused for a moment. “Plus whatever prisoners are here have been here for hundreds of years, and if they haven’t managed to escape yet, then they’ve probably at least learned the ins and outs of the prison.”

Grak frowned. “It is … plausible,” he replied. The pause felt uncomfortably long. “Entad architecture is rare. Sentient entads are rare. Sentient architecture, there perhaps a hundred in Aerb are. I have not them studied.” It was the first time I could recall hearing his Anglish slip in the entire time I’d known him. His face was screwed up in concentration.

“What would that mean, in practical terms?” asked Amaryllis.

“Bite-sized threats,” said Fenn with a nod. “Maybe we’ll get lucky and come across some clashing factions.”

“Let’s get moving then,” said Amaryllis. “Everyone is healed up? Are we fine on bones?”

“Just over two hundred left,” said Fenn, wiggling the fingers of her glove. “I’d thought that would be more than enough, but –” She stopped and glanced at me. “I didn’t think that Juniper would be our only source of repeat healing, and the fairies are only for legitimate I’m-going-to-die emergencies.” Because Solace was supposed to be doing the heavy lifting, and now she was gone.

“Then we’ll go slow and cautious,” said Amaryllis. “We have a simple objective, let’s not complicate things.”

“Contact,” said Fenn as soon as the words had left Amaryllis’ mouth, and it wasn’t quite unbelievable that what Amaryllis had said would coincide exactly with something coming around the corner, but it did seem uniquely improbable, unless the enemy was listening in on our conversation and wanted us to have a chance to finish talking.

“I wish to parlay!” called a high, woman’s voice from just out of view. An arm made of dirt waved at us from just beyond the end of the hallway. I could see the point of Fenn’s arrow tracking it. Amaryllis looked to me and Grak with a raised eyebrow. “We would be willing to talk,” she called back to the golem. Fenn lowered her arrow with an exasperated sigh and kept her arrow nocked. We were all on war footing; I’d drawn my Anyblade without even thinking about it.

The dirt golem sidled into view, its too-human mouth giving us something disturbingly close to a
“Please, if I may,” it said, “I believe we got off on the wrong foot with our affray.”

“What happened, from your perspective?” asked Amaryllis. Her sword was in her hand, and she flickered it off, which to me sent mixed messages given how lethal it could be when it reappeared, but it seemed like it was intended as a defusing gesture. I lowered my own weapon, but didn’t sheath it.

“There was a problem with the message I was trying to convey,” said the golem, turning its head slightly. “My voice was lost, the statues reacted, and I thought it best to enter into melee.” That was much faster confirmation of my theory than I was expecting; the entity controlling the dirt golem considered itself different from the statues.

“And you’ve reconsidered?” asked Amaryllis.

“You are formidable fighters, to have destroyed those creations,” it said with a gesture to the suits of armor, “That one of your own died was met, by you, with dismay. And if resistance is met with destruction, then I must not block your pathway.”

“It … doesn’t think that it can beat us?” asked Fenn. “Well that’s a lucky break.”

“Unless it’s a trap,” I said. “I don’t think it is, given the level of sophistication the traps have had so far,” almost none, “but … that doesn’t mean that it’s not a possibility.”

“You won’t stop us?” Amaryllis asked the golem.

“Why have you come this day?” asked the dirt golem in response.

“We told you,” replied Amaryllis, keeping her voice far calmer and more pleasant than I would have been able to. “We seek a specific prisoner, one that you said was being moved to a visitation area, Fallatehr Whiteshell.”

“And it is only that you have something you wish to say?” asked the dirt golem.

“We’d like a conversation, yes,” said Amaryllis, which was just short of being a blatant lie. We were planning on extracting him, if we needed to, and we did expect to need to in order to get what we wanted from him.

“Then come,” said the dirt golem, “Come this way.” It tottered off into the giant dome, moving at a steady pace and pausing without looking at us when we didn’t make a move to follow. Just off in the distance I could make out small little dirt golems looking at us; these things had already proven that they had some form of silent, internal communications.

“Are we going?” I asked, keeping my voice low.

“Yes,” said Amaryllis. “If we’re going to continue on at all, I think we need to take the peace offering at face value. For now.”
All the Myriad Ways

Moving through the prison following the dirt golem was nerve-wracking. We saw more dirt golems as we walked, usually from a distance, but there were an awful lot of them, and I was worried that I wouldn’t be able to handle them as effectively up close, if they trapped us in a hallway. Our golem guide was silent as it walked, and behaved more or less like I would expect a videogame NPC to, stopping when we stopped and behaving as though it was going through a script (which, for all I knew, it was).

Grak stopped every time we came to a new hallway and raised his monocle to his eye, but whenever he said that it was clear, he gave me a look for confirmation. After the first two times I started to feel a little bit guilty about it, because I didn’t actually think that Aerb could be entirely predicted on the basis of genre or narrative conventions. You had to be aware of them, but the way I had always handled things was to subvert, invert, or change the tropes as often as I played them straight. If we came across a scheming vizier, I would have to consider that he was betraying his king, but also that he was just a loyal vizier, or that it only looked like he was betraying his king, or any number of other possibilities. That didn’t mean that there was no predictive value in knowing the tropes, just that they were pretty far from being an absolute guide.

I hadn’t been able to predict that a bomb was coming out to greet us at the prison’s front door. I hadn’t foreseen Solace’s death. It was easy to make sense of it in retrospect, to fit it within different frameworks, but that was all useless if you did it after the fact. Maybe that was why I hadn’t pushed back against Grak when he said that the statues weren’t magical, or why I had yelled at him after it had turned out that I was right. That sheer uselessness, the way that I almost had a grasp on what was going on and it wasn’t doing me any good, was really starting to get to me -- and had been, even before Solace.

“Here, through this passageway,” said the dirt golem as it came to a stop, gesturing at a door.

Grak raised his monocle and spent a long while peering at the door, then lowered it with a frown. “Nothing that I can see.” He turned to me. “Juniper?”

I had no fucking idea. “Let’s just go in.”

We weren’t idiots about it, and did a passable door clear with Fenn aiming an arrow straight through the crack and no one standing directly in front of the door, but the room had only a table and a handful of chairs, with an elf seated in one of them. Grak informed us of a powerful ward stretching from one wall to the other, bisecting the room; the golem had told us that it was an absolute ward, built with a layer of defense against every possible type of magic, and he tentatively agreed with that assessment.

The elf sat with his arms folded across his bare chest. He had scars like the ones that Fenn had, but far more extensive, covering his skin from his wrists, to the base of his neck, and down his chest, in similar patterns of curls and whorls. But those weren’t the only scars he had; giant scars, each the width of a hand, crisscrossed his chest. The meaning of that was obvious to me. If scar magic was predicated on the unchanging nature of elf skin, then the way to deprive an elf of that power was to tear some strips of skin off him. The man himself stared at us with that same, tight-lipped, imperious expression I’d seen on every elf I had passed by in both Barren Jewel and Cranberry Bay. He had long, flowing hair, so blonde it was almost white, and ears that were more sharply pointed than Fenn’s. He had little in the way of fat or muscle, but I knew from Fenn that didn’t matter too much for elves, in terms of what it said about combat ability. We slowly, cautiously moved into the room. I took one of the chairs and Amaryllis took the other, while Grak and Fenn were left standing.
“Very --” the elf began.

“Fuck!” I shouted, jumping halfway out of my chair, because when he’d started speaking I had seen his teeth, long, sharp teeth like a piranha that instantly awoke a basal fear in me.

And then, after I’d had a look around the room and seen the confusion on everyone’s face, I sat back down, feeling a growing warmth on my cheeks. *No one else is surprised. This is just what elves are like, and everyone knows that. Fenn had pointed out that she was a half-elf when we first met by pointing at her ears and her teeth. Obviously elfish ears, obviously human teeth.*

I coughed once. “You were saying?”

The elf stared at me with pursed lips. “Who are you?” he asked. I tried not to recoil from the view of his sharp teeth, which were visible when he spoke.

“We come seeking your expertise in souls,” said Amaryllis. She had given me a look of incomprehension, when I’d had my outburst, but now she was as good as pretending that I wasn’t there.

“Ah,” said the elf. He smiled at us -- more specifically, at me, revealing his pointy teeth in full. I had a guess that wasn’t so friendly of an expression in elf culture. Just a hunch. “And who are you? What interests do you represent?” There was something very subtly off about his accent that I couldn’t place my finger on.

“We are independent actors,” said Amaryllis.

The elf shook his head. “No,” he said.

“No?” asked Amaryllis. “No, you won’t help us, or no, you don’t believe us?”

“No, I do not believe you,” replied the elf. “You are too well-armed to have come alone.”

“We’re really very wealthy actors,” said Fenn. “Our little troupe has done quite well for itself.”

“And do you offer escape?” asked the elf. “You have suffered, getting here.” That, at least, was easy to see; we were all varying degrees of bloody, and my blue armor was marked white with every hit I’d taken. I had used bone magic to heal Amaryllis’ leg, but there was no longer immobility plate covering it, and there hadn’t been anything we could do about that.

“We want knowledge first,” said Amaryllis. “Tell us what you know of the soul, --”

The elf began laughing, a high, melodious sound. “I know everything there is to know,” he said. “Everything knowable outside the exclusion zones.”

“Enough that we could get started on our own,” said Amaryllis, without looking my way.

“You want classes,” laughed the elf. “The warden would never allow it. It would take years of study to have even the barest comprehension of your own soul, let alone to touch another’s.”

I didn’t say, “try me”, though I really wanted to, because Amaryllis was on point for diplomacy.

“You were arrested and tried by the Kingdom of Anglecynn for the horrors that you perpetrated under the Second Empire,” said Amaryllis. “You hadn’t broken any laws, but the power had shifted and examples had to be made. I am sympathetic to that, retroactive criminality is a miscarriage of justice. We want to help you, so long as you help us.”
“And do you offer escape?” the elf asked again, leaning forward slightly, still with his arms folded across his chest. I was painfully aware of a few facts. First, that the void wasn’t considered magic on Aerb, and couldn’t be stopped by wards, and second, that the prison hadn’t seemed to understand that it was carrying a void bomb to us until well after the fact. The barrier between us had a few flaws that I could think of, but that was the glaring one that was getting my attention. Hell, that was how I was planning on killing him, if it came to that. The void rifle was in Fenn’s glove, and she was waiting for the signal.

“You understand that trust is an issue,” said Amaryllis. “That’s why we want to get the basics, the bare basics, first.”

He narrowed his eyes and looked between the four of us. “It is a test,” he said with a nod. “But knowing that it’s a test makes it pointless, because you know that I know enough to pass, and if I know it as a test I can fake cooperation. Which you know.”

“Indulge us,” said Amaryllis with a slight frown.

The elf stared at her, then blinked once. “It’s not a test,” he said, looking between us again. “Why are you here?”

“You’ve been stuck here for hundreds of years,” said Amaryllis. “The majority of the other inmates must be dead by now. I would think that you would want to show off. What’s holding you back?”

“What specific expertise do you seek?” asked the elf.

Amaryllis hesitated. She didn’t look my direction; if I were her, I wasn’t sure that I would have been able to resist.

“I know a bone mage who sucked several of his own bones dry,” said Amaryllis. “I was given to understand that a soul mage could help with that problem.”

The elf smiled again, with the same unpleasant display of teeth. “A simple problem,” he said. “One of the soulself. I could fix it within a half hour, were escape on the table.”

“I haven’t said that it’s not,” said Amaryllis.

“You haven’t said that it is,” the elf replied.

“I assume that the warden, as you call it, listens in on all conversations that take place in this room,” said Amaryllis. “We would, therefore, never directly say that we were willing to help you to escape.”

“You are cautious,” said the elf. “Cautious enough that you would never let me touch the soul of someone, even if it were to fix damage, for fear of what I might do.”

“No, of course not,” said Amaryllis. She crossed her arms, mirroring him. “We don’t want you to engage in any actual work. We want you to teach someone without laying your hands on the soul directly.”

“And you would still not trust me,” said the elf with an approving nod. “My pupil would not be allowed to practice soulcraft unless he first understood precisely what he was doing. You would bring in test subjects before ever touching your valued bone mage.”

“If we had to,” said Amaryllis.

“And then you would kill me, as much understanding as you might have for my plight,” the elf
Amaryllis frowned. “I can see where that would be the logical conclusion,” she said. “Is there anything that we could do to assuage your concern?”

“Traditionally, the kingdoms of men would take hostages,” he replied. “But of course, such an exchange doesn’t work when we do not know the map of values. You might give me a hostage you did not care for and accept such a cost for concluding business.”

“Then we’re at an impasse,” said Amaryllis with a sigh. “Unless you want to stay here for the rest of your life, you’re going to have to take a chance on us. I solemnly promise not to kill you, or have you killed, or even allow anyone else to kill you while you’re under my care. You will effectively serve as our prisoner until the training is complete, but your conditions will be better than they are here, and you’ll have access to whatever information you want about the outside world.”

The elf gave her a thoughtful look. “And were escape an option, how many could you take?”

Amaryllis hesitated at that, and finally broke eye contact with him to look to Fenn. “How long are the masks good for?” she asked.

“An hour,” replied Fenn.

“And they’re made using the kit?” asked Amaryllis.

Fenn nodded. That meant we had a practically unlimited supply of them, meaning that if we had a lot of time and coordination, we could put two or three hundred people into the glove, as an upper bound.

“It would, of course, depend on who these people were,” said Amaryllis. “We could keep careful watch over two or three people, potentially, but --”

“Twenty,” said the elf, unflinching.

“Friends?” asked Amaryllis.

“Something like that,” replied the elf.

Amaryllis stared at him for a moment, furrowing her brow. I didn’t know what she was thinking, but I was thinking that even if we could overcome the logistical hurdles of getting twenty people out of this prison, which would likely mean destroying every security system and golem in the place, there was no way that the four of us could keep twenty people contained except through their own goodwill. And these weren’t just twenty people, these were twenty elves, faster and stronger than humans, long-lived enough to have acquired a wide variety of skills.

“Miss Red, may I have my amulet please?” asked Amaryllis, holding her hand out toward Fenn.

The blue amulet appeared in Fenn’s hand, and she tossed it over without another response. I hadn’t asked Fenn how she would feel about seeing another elf, but my guess of ‘not good’ seemed to be mostly accurate. She didn’t seem to be in a great mood, not that I thought any of us were.

Amaryllis held the amulet in her hand, and her eyes glowed blue as she consulted with it. I felt a chill come over the room as the minutes passed.

“What magic does she hold in her hand?” asked the elf.
“Are you interested?” I asked. “If you want knowledge for its own sake, we have plenty that we can share with you, as a way of rewarding good behavior.”

The elf shrugged, but his eyes stayed on Amaryllis, who was taking her sweet time talking to her great-grandfather. Eventually her eyes cleared, and the room immediately warmed back up. She tossed the amulet back to Fenn without looking, which seemed pretty careless to do with a priceless artifact, but based on the way her jaw was clenched, I got the sense that she hadn’t had a great talk.

“He’s not Fallatehr,” said Amaryllis.

“I never said I was,” replied the elf with such smooth arrogance that I nearly reached across the table to punch him in the face.

“Seems like he’s sort of useless to us then,” said Fenn. I saw her gloved hand twitch slightly.

“Who is he then?” I asked with a frown. “And why would the prison think that he was the one we wanted to talk to?”

“I am not Fallatehr,” said the elf. “He took my soul and reformed it in his own image.”

Quest Updated: Crimes Against the Soul - Fallatehr Whiteshell has altered every remaining prisoner at the Amoureux Penitentiary to become as close to him as possible. Only the real Fallatehr will serve all purposes.

“Scenario two,” I said to Amaryllis. Scenario one was confirmation that Fallatehr was a companion; scenario two was a change in the quests; scenario three was a new quest. “And that’s why you want to move twenty people out. Fallatehr, and people like you.”

The elf nodded. “If it can be done, do it.”

“We wanted a lesson,” said Amaryllis. “But you couldn’t actually pass that test, could you?”

The elf shook his head.

“Well fuck this,” said Fenn. “We’re talking about twenty of this guy? He already tried to kill us once, we don’t need him that badly.”

“We have other options as far as healing goes,” said Amaryllis, staring at the elf. “But that’s not the extent of our problems. Fallatehr Whiteshell might be the only person that can resolve the other one.” Might. We didn’t actually know that soul magic was going to be needed to get the locus back out of the bottle and connected with a new land, but Solace had thought it likely, and it was as good of a guess as we had at the moment. Besides that, if Fallatehr had been a part of the Second Empire at the time it was going on its campaign against the loci, and he was important enough of a researcher that he’d been made an example of, then it was possible he had more information about the soul of a locus. That was all still all up in the air though, and nothing that I really wanted to risk my life on.

“You may consider me interested,” said the elf, looking between us. “I can relay your message, and your offer.”

“We haven’t made an offer,” said Amaryllis. “We only came here to talk. It’s true that we have a fair amount of magic at our disposal, but we still don’t have any way to ensure a working relationship.”

“You need him,” said the elf with a smirk. “You took a risk in coming here. You didn’t turn away at the first or second sign of danger. You don’t turn away even now, as difficulties pile up.”
“I think all I’ve heard so far is that we don’t need this guy alive,” said Fenn. She was drumming her hand against the side of her leg.

“It wouldn’t be good for our negotiations,” said Amaryllis, turning only slightly in Fenn’s direction before looking back at the elf.

We still hadn’t gotten his name, but apparently it didn’t matter, because whoever he had been, he had been altered on the level of the soul to become something else. I still didn’t know what that entailed; memories, abilities, values, something else? Soulfuckery wasn’t really a realm that I wanted to delve into too deeply, not if it was going to expose me to more horrors. I’d had enough non-diegetic existential horror without having to go through a fresh round of it happening on the Aerbian layer.

“Talk to your master,” said Amaryllis. “I’m sure that twenty heads are better than one. Tell him that we need to have our own discussion, in private, and that he might not hear from us again. We might have to arrange another meeting like this in order to get some information on … the specifics of his incarceration.”

The elf looked at her for a while. “We are not slaves,” he said. “He might agree to being taken alone, but the rest of us would not let him go so easily. We are like him, enough so our prison can confuse us, but we are not clones, nor automatons, nor perfectly loyal.” He stood up, unfolding his arms. I’d been worried, the entire time, that he would have a void weapon in his hands, but all that worry was for nothing; he was unarmed. “Do you offer escape for all of us?”

“I don’t offer escape,” said Amaryllis. “If I did, I would take your unique circumstances into consideration.”

“Did everything go your way?” asked the dirt golem as we left the room. Compared to the elf’s mouth, I found its detailed simulacrum of a mouth almost comforting. “Did he have anything of interest to say?”

“It was illuminating, yes,” said Amaryllis. “I’m afraid that our business isn’t concluded yet.”

“Most troubling,” replied the dirt golem, “You have led me astray. You said what you came to say.”

“We need to talk amongst ourselves in private,” said Amaryllis. “My friend is going to make a ward against sound so there’s no threat of anyone hearing.”

“What about reading lips?” I asked.

“I can make a ward against outgoing light,” said Grak. “There is some risk of overheating. I do not know how long we will talk.”

“I meet this proclamation with dismay,” said the golem. “No wards, this prison, put up, since.” It stopped, with its mouth slightly open. “Very well, you may.”

Grak began drawing out the wards, first one to encircle us that immediately blocked out the sound, and second one just beyond the first, which warped the world around us in an unpleasant and slightly disorienting way. Light couldn’t leave the cylinder we were contained in, so it bounced around the inside until it struck something, and sometimes that something was my eye. I could still mostly see out, but it was a visual struggle.

“We can’t let the locus die,” said Amaryllis, as soon as the second ward was complete.

“These wards should hold for an hour,” said Grak, “Maybe less.”
“The terms of the quests that I have don’t actually indicate that we need Fallatehr or soul magic,” I said. “Solace didn’t know for sure that soul magic was needed. At this point, it’s looking very dangerous. If he can rewrite a soul --”

“He can’t, not fully,” said Amaryllis. “That’s excluded.”

“Right,” I said. “And I actually think that we might have had an easier time of this if they were all just puppets, because it sounds like they have enough free will to not want him to leave by himself. I don’t know what mechanisms he’s got to keep them in line, but they’re only close enough.”

“Three factions are not too many to fight,” said Grak. I wasn’t quite sure how he was counting them, but my guess was the soulfucked prisoners, the old, static defenses of the prison, and the dirt golems was a good guess. Of course, there was also the possibility that we’d only scratched the tip of the iceberg, as far as threats went.

“I’m with the dwarf,” said Fenn. “Kill everyone but the one we want, then take our leave. Sounds like a plan.” She looked out at the ward. “This thing is giving me a headache.”

“We obviously can’t take all of them,” said Amaryllis. “A disproportionate ratio of guards to prisoners is only made possible by either strict systems of control or an adequate level of socialization, neither of which we have, or can have on short notice.”

“And short of getting the real Fallatehr into one of those visitation rooms, we’re going to have to run afoul of the golems, at the very least,” I said.

“The wards include absolute velocity,” said Grak. “The glove would not be able to pass. The ward would prevent him from ever touching it. On first impression, I do not think that I could subvert it.”

“So that plan dies in the cradle,” I said with a wince. “We can fairly easily overpower the dirt golems, I think, they had us badly outnumbered last time and we made it through -- but the game called them ‘basic’, so I don’t know if that will hold true.”

“We’re doing all of this to break out someone who we don’t have any reason to think will be loyal to us,” said Amaryllis.

“But based on what your grandfather said, he’s the best?” I asked.

“Great-grandfather,” Amaryllis replied. “And yes, Fallatehr Whiteshell does seem like one of the most capable soul mages to have ever lived, if he could take over twenty other men and women in virtual perpetuity, nevermind doing it under the watchful eye of an imprisoning entity.”

“I can’t say that I’ve been that impressed by the prison so far,” said Fenn. “Seems like we’re getting a bit of a free run because it thinks we could kick its ass.”

“It maneuvered us deep inside,” said Grak.

“That’s what she said,” I replied. It got a snort from Fenn, but only a look of disapproval from Amaryllis and Grak. “Sorry.”

“We are more vulnerable to the golems here than we would be elsewhere,” said Grak. “They could attack us from both ends of this hallway.”

“They could try,” said Fenn. “I can’t say that a bow and arrow seem particularly great at taking out those golems, but I’m willing to give it a shot.”
“It comes down to threat analysis then?” I asked. “The golems hit hard, but they’re slow and easy to take on in multiples. My armor is getting a little bit white for my tastes, but if it were just a matter of killing our way through dirt golems and dirt golem variants, I would be fine with that, especially if there are three quests in the mix. But it’s not just that, it’s facing down other kinds of idiosyncratic threats, plus trying to navigate around maybe two dozen almost-people who have got to be threats in their own right, if they’ve each been here for hundreds of years.”

“I’ve already said that I’m in,” said Fenn. “I don’t know that it’s what Solace would have wanted, but it’s what I would have wanted, if I’d been Solace.”

“I agree,” said Grak. Fenn had joked before about him being suicidal, but I was starting to believe there was some truth to that. For someone whose specialty was in setting up defenses, he sure seemed eager to throw himself up against new and uncertain challenges.

“Juniper?” asked Amaryllis.

“Mary,” I replied.

“What are your thoughts?” she asked.

“I want to hear yours first,” I replied. We were, by agreement, a democracy, which meant that third vote could make the fourth vote irrelevant. If I voted before her, she could vote in agreement with me as an act of manipulation, even if she didn’t actually think it was smart. She’d be giving up an opportunity to exert her will, but fourth vote was a position of power, in a lot of ways, and I didn’t want her to have that, not when she was trying to get it so transparently.

“Narratively --” she began.

“You can conclude this without me,” said Fenn. She stepped beyond the wards without another word.

“I wasn’t aware that she was so sensitive to that word,” said Amaryllis, staring beyond the ward. “But it’s necessary for us to talk about, I think, given the context.” She took a breath. “Narratively, I don’t think that we actually have a choice. Joon, I know that you would prefer to simply abandon talk of narrative and take things on their merit, but … assume that narrative is a rule of the world. Assume that it can be subverted, or changed, or something like that, that it’s not absolute, yes?”

“Okay, yes,” I said slowly.

“We came here following a quest that was given to us by the amulet we found at Caer Laga,” said Amaryllis. “When we arrived, Solace lost her life protecting the cloak that contains the locus, the very same locus that we might be able to save using the soul magic of the man who we’re here for. Now we have multiple antagonists in front of us, in a large area that approximates a dungeon in many respects.”

“I get it,” I said, “There’s a lot of narrative weight. But we absolutely cannot do things just because the plot says so. End of discussion on that.”

“Do you recall telling me about the Scattered Asches campaign?” asked Amaryllis.

I winced at that. The Scattered Asches campaign had started normally enough, with the party meeting each other during community service, saving the life of a distressed princess, and getting sent off to do some very sensitive work because they were a band of skilled eccentrics well outside the kingdom’s spy network, all pretty normal as far as campaign starts went. The problem was that after the first dungeon, they found a Clue as to greater goings on which threatened the Eight Realms
… and then left to go be ninjas on another continent, dropping that plot thread entirely and forcing
me to scrap about two weeks worth of work.

But the way I thought about worlds was that they didn’t just stop running because you weren’t
looking at them, or because you went off to go do something else. If the threat the party had seen
was real, and they just ignored it, then that thread couldn’t just quietly die on the vine, something had
to happen with it, either another party would have to come in and deal with it, or it would grow and
fester, but either way, in a living, breathing world, you couldn’t just drop plot threads, because that
would make it seem like the world wasn’t alive.

So the threat had grown, slowly and steadily, and as the party went to ninja school and got involved
in ninja plots, they would occasionally hear whispers and rumors from the Eight Realms, they would
come across people in exile, and that original plot, one meant for characters of 3rd level, grew until it
needed all their might at level 11 to defeat it. Everyone enjoyed it, maybe more because they saw it
coming than because I didn’t just let them drop it, but that was my go-to method of dealing with a
player that dropped a quest -- let them drop it, sure, but there would be consequences, echoes, and
aftereffects.

And if we just left the Amoureux Penitentiary, and tried to get me access to soul magic some other
way, what would the Dungeon Master do? He might railroad us hard, but even if he didn’t, then he
might not be willing to drop all the narrative threads, or to say that sometimes things were
meaningless, pointless, wastes of time and resources. For myself, games, movies, television, and
literature were the few places that I wasn’t comfortable with embracing the bleak meaninglessness of
existence.

“I understand what you’re saying,” I replied. “But if it were me, and someone said, ‘Oh, well I guess
we have to, because that’s clearly what the DM wants’, I would have a long, out of character
conversation with them about how it’s not about what the DM has planned. And failing that, if I for
some reason had no way of communicating with them outside of the game, I would figure out some
way of communicating to them within the game that there had been other options, that it was okay to
go off the beaten path.”

“Except you would bring them back to the original plot,” said Grak. “It’s contradictory.”

“Of course it is,” I practically shouted. “You’re making all this crap up as you go along, it’s a process
of reconciling different learned lessons and feeling your way along by intuition. That’s why I think
that we would be fundamentally unwise to follow along with what we think the entity, or the
narrative, or whatever, wants from us. Maybe it’s rolling its eyes at this conversation.” Or maybe it
was looking on in glee, though that was a less pleasant thought.

“Fine,” said Amaryllis. “Leaving narrative out of it, you cap your skills at 20 unless you have a
proficient teacher. Soul magic is powerful, if less so now than it was hundreds of years ago. Fallatehr
is demonstrably one of the most powerful soul mages that we’re likely to have access to, and the
ways in which that access is dangerous are ones that we can deal with by sufficient application of the
force we have available to us. I believe to get better than him, we would have to either go into one of
the exclusion zones that got soul magic partly excluded, or we would have to somehow poach from
one of the larger polities within the Empire. We need to heal you, sooner rather than later, we need to
get the locus out, sooner rather than later, and I know that I said it was a distraction, but if you want a
third path for Solace, not the oblivion or hell that currently awaits her, this seems to me to be one of
the only ways that’s going to happen.”

I felt an uncomfortable sinking feeling in my chest. She could have led with Solace, and I probably
would have changed my vote right then. “Okay,” I said. “Then I guess it’s unanimous.”
When we came out of the wards, Fenn was standing with her arm around the dirt golem.

“Productive conversation?” she asked.

“We’ll be staying around here for a little bit,” said Amaryllis, speaking more to the golem than to Fenn.

The golem slumped slightly to the side, and Fenn moved away from it.

“Unanimous?” asked Fenn, with a glance in my direction.

“Yes,” I said. “It took some convincing.” The golem’s slump became more pronounced as I watched it. “What were you doing out here?”

“Girl talk,” said Fenn. The golem fell to the ground. “I didn’t think that it went that poorly.” Her bow appeared in her hand. “So, my guess is that our prison-host didn’t like the news that we would be staying?”

“I think it only gave us a reprieve in the interests of getting us out of its way without further incident,” said Amaryllis. “I hadn’t thought that our peace was so easily disturbed.” She’d taken her helmet off for our conversation, but now was slipping it back on. “Prepare for trouble.”

“And make it double,” I replied, letting my sword grow to full length in my hand.

“What does that mean?” asked Grak with furrowed brows.

“It was -- nevermind,” I replied.

“Earth stuff,” said Fenn with a nod. “He always gets this look in his eyes.”

Amaryllis looked down the hallway in both directions. “We should get moving. Deeper in, or back the way we came?”

“Deeper in,” I said. “The golem said he’d been in the gymnasium, let’s start there. I was really hoping that we’d get something like directions.” I looked down at the mound of dirt on the ground. It struck me as being enemy action; the only way I could fathom the breakdown of a golem in response to threat was by either a severely malfunctioning system or very high level reasoning about what that golem might give away by its continued existence. “We should hold off on going against the golems again until after they’ve made the first hostile move.”

“I suppose,” said Amaryllis.

“Kind of a hard principle to follow if you have a bow,” said Fenn. “I’m down to two artillery shots, in case I was the only one counting. Call them if you need them, but if I see a juicy shot I’m taking it, no matter who’s in the way.”

“Please don’t shoot me again,” I said.

“Oh, we’re dating now,” said Fenn, “I pretty much have to shoot you, otherwise the others will think that I’ve gone soft.” She gave me a grin, and I returned a smile.

“I already think you’ve gone soft,” said Grak.
“That’s just because you’ve gotten to know me,” said Fenn.

“We should go,” said Amaryllis. “I have to imagine that forces have already been moved into position since the moment we finished our first fight, but light might become an issue for us if we go too slowly.”

So we moved on, deeper into the prison, past the half-dozen visitation rooms that must have been the prison’s primary interface with the outside world back when it was in regular use. I briefly marveled at the shape and scope of the forge frenzy that had brought this place into being. I had no real idea how long it took to make a sword or a suit of armor, but months seemed like it was on the right timescale. For a building this size, it would have taken years, if not decades. From what I could tell, most polities were perfectly willing to fund a forge frenzy given that they would have control of whatever was made from it, but a place on this scale seemed like a serious outlay, especially since Anglecynn wouldn’t have known exactly what it would do.

If we’d been in a normal building, we might have had an easier time finding our way to the gymnasium, because normal buildings had sensible designs that were dictated by the emergent properties of people, or at worst, dictated by what the architect thought looked good -- function or form. The penitentiary hadn’t been built under any such constraints. It wasn’t quite the Winchester Mystery House, but we couldn’t at all count on a sensible layout. There was a part of me that appreciated this on a game design level, but it also gave me an uncertain, claustrophobic feeling.

We eventually came to a small dome, with three floors exposed below it and a dozen dirt golems looking out over them. Our eyes were drawn to an immense brass suit of armor, nearly twenty feet tall, which stood with both hands on the pommel of a hammer whose head was more than twice the size of my own. Both it and the dirt golems, were unmoving. At twenty feet tall, it wouldn’t be the largest thing that I’d gone up against, but it would be the biggest thing I’d directly fought. Colossus, I shall call you.

“So, plink at it from a distance?” asked Fenn. She kept her voice low, which didn’t make that much sense, because even though we were quite a ways down the hallway from the entrance to the dome, the golems were staring at us.

“We don’t necessarily need to go this way,” said Amaryllis.

“They are guarding this path for a reason,” said Grak.

“I’m pretty sure a single hit from that hammer will kill any of us outright,” I said. “Maybe not Mary.”

“The immobility plate isn’t that resistant to movement in its immobile state,” she said, voice slightly muffled by her helmet. “It has limits.”

“So we cheese it,” said Fenn. “That’s the word, right Joon? Cheese?”

“Oh, yes,” I said. “But if it were me … scratch that, if I were the penitentiary, I wouldn’t put a giant guy with a hammer where you could kill it from a distance at no risk. If it’s a trap, then this is part of the trap. Besides that, plinking at it from a distance doesn’t seem like it’s going to work well if the armor is thick enough. The right arrowheads can pierce normal plate, but that’s not normal plate.”

Fenn looked to Amaryllis. “And if we had a secret weapon?” she asked.

“Oh, what?” I asked, looking at both of them. “Secret … from me?”

“I present to you,” said Fenn, holding out her gloved hand, “Drumroll, please.”
“I’m not clear on why you would need to keep anything secret from me,” I said.

“You don’t like surprises?” asked Fenn, lowering her hand slightly.

“Not in combat, no,” I replied.

“It’s too dangerous to use in actual combat,” said Amaryllis. “It’s probably too dangerous to use, period, if it works at all.”

“Grak, can I get a drumroll?” asked Fenn.

Grak gave a short sigh, then went to the closest wall and began rhythmically pounding on it. With a flourish Fenn produced an arrow from her glove, twirling it gently until bringing it to a stop so I could see the tip, where a small, simple, electrical contraption surrounded a purple crystal.

“I present to you, the very first Fellis collaboration, the void arrow,” said Fenn with a grin.

“And with the artillery shot,” I began.

“In theory,” answered Amaryllis. “It might fail. We didn’t want to waste the resources to test it.”

I stared at the void arrow. All you really needed to make a void crystal explode was a sufficiently powerful electric charge, which would cause it to radiate void out in all directions, eliminating matter from existence. From what I could see, the arrow was designed such that it would strike its target, which would complete the circuit, which would detonate the crystal. You couldn’t shoot the arrow too fast, because otherwise the mechanism would break completely, and it was possible that it would break anyway, but if it worked, then it would be an instant kill against unarmored flesh. And the artillery shot from Fenn’s bow, given enough distance, could make two thousand.

“Well that’s scary,” I said, swallowing the sudden lump in my throat. “I’m still not sure why I would be kept in the dark.”

“I’d have to use the n-word to explain it,” said Amaryllis.

I stared at her for a second. “Uh?”

“Narrative,” said Fenn with a nod.

I rolled my eyes at that. “Okay,” I said. “You kept it from me because … you think that this is my story, not yours, and keeping the void arrow from me until the last second would be better from a narrative perspective. That’s batshit insane, don’t ever do that again.”

“I don’t want to debate it now, but if we can infer from --”

“You don’t want to debate it, but you do want to get your point in,” I said. “No, let’s just fire the incredibly dangerous arrow and get it over with.”

Amaryllis helmet turned away from me and nodded to Fenn.

“So, in theory this is a weapon of mass destruction,” said Fenn, looking at the brass Colossus. “Assuming that Mary built this right, how far back should we be standing?”

I was actually curious about that myself: curious, bordering on alarmed. “What happens when the void effect hits a void crystal?” I asked. “Anything?”

“If they’re further than a foot away from each other, there’s a cascade,” said Amaryllis. “Less than a
foot, and the void effect just consumes the crystal with no effect. I’ve already done the math, we’ll need significant distance and heavy mass for cover.”

“Sorry, walk me through the math,” I said, pinching the bridge of my nose. I glanced at the brass Colossus, which was, thankfully, still unmoving. For the moment, talking was apparently a free action. “So what happens is, Fenn fires the void arrow, it presumably splits into two, then four, then eight, and so on, until it caps at two thousand of them, then one of them hits something and detonates, which then chains to all the others —”

“Voiding whichever ones are within a foot of the spherical void wave, cascading to those outside it, putting a limit on total void effect, yes,” said Amaryllis. She was incredibly hard to read with her helmet on, but I didn’t think that I could ask her to remove it just so I could be more at ease when talking to her, not without derailing the conversation.

“So at best, the total void effect coming our way is going to be equal to however many one foot-radius spheres there are, with each centered around an arrow and none overlapping,” I said, “Which based on the arrows that I saw in the forest might be as high as, oh, two hundred spheres, which means that the void effect coming at us once the artillery shot is fired will be enough to go through something like one hundred inches of solid steel.”

I saw Grak and Fenn give each other a look, something like surprise and fear.

“No,” said Amaryllis, “Void propagation is constrained by the inverse square law, it’ll eat through the same amount of mass at any distance, but for the projective form, that means if you conceptualize an inch-thick sphere around a projection at distance $x$ which completely captures the void projection, then an inch-thick sphere at distance two $x$ will only go through one fourth of an inch.”

“So at two hundred feet, which is where the bow caps, that’s … a half-inch of steel per detonation, when up close?”

“For projection, it’s usually given as a half-inch steel or other sufficiently dense metal at five feet from the center of the void projection, regardless of crystal size, so long as it’s under one foot,” Amaryllis nodded. “I told you that I already did the math.”

“I’m double-checking, in the interests of not killing us all,” I said. “And, obviously, that’s the benefit of consulting me instead of keeping it secret. So, forty times the distance, that’s $1/1600$th the effect, which means that instead of one hundred inches of steel, we’d need something like a sixteenth of an inch.” Which was extremely doable, actually, and there was enough leeway to be off by an order of magnitude. And because Fenn’s bow multiplied with distance, we had some leeway even with a premature detonation. “Okay,” I said. “So it’s still stupidly dangerous, but probably, maybe, not as dangerous as fighting that thing and all the little ones that would join in.”

“Am I shooting this incredibly destructive arrow or what?” asked Fenn.

“All six barriers first,” said Amaryllis.

Fenn moved forward and started popping them out, one by one, and we took cover behind the last. She raised her bow and nocked the arrow, then ducked down quickly before firing. “Just testing,” she said. “How fast does the void move?”

“It’s effectively instant,” said Amaryllis.

“Okay,” said Fenn. She raised her arms above her head and did an awkward draw with only her hands and the bow, held horizontal, above the barrier. She managed to get it to full extension, then
stopped suddenly and brought the bow back down without having fired it. “The thing is, I didn’t do the math, so I’m sort of trusting you here.”

“No, no, never,” said Fenn. “But when you said a hundred inches of steel, I thought, ‘you know, that actually sounds right’, and then when you said a sixteenth of an inch of steel, I thought, ‘that doesn’t seem right at all’, and I don’t think that this is how my life is going to end, but you said sometimes rocks fall and everyone dies, and I’m the least suicidal of us, so --”

“Just fire the fucking arrow,” said Amaryllis.

Fenn raised her bow again and did the same awkward draw as before, exerting an incredible amount of strength and control, more than I might have thought her capable of, if I hadn’t known her so well. She started to speak, with the strain evident in her voice. “The thing is, I’m the one risking my hands here --”

“Is this a bit?” asked Amaryllis.

Fenn fired the arrow and brought her hands down behind the safety of six inches of steel. I was fully prepared for an anticlimax after all that build-up, like the arrow simply plinking against the brass suit of armor, or failing to duplicate, or maybe even something worse than an anticlimax, like littering the whole place with two thousand undetonated bombs.

But we weren’t denied something special, and instead there was a loud whump of air rushing to fill the vacuum, and wind blew by us fast enough that it was difficult to breathe, for a bit. I started to rise to my feet, then thought about the possibility that there were still void arrows that hadn’t blown up, and stayed where I was. When Fenn popped up though, I followed her, and looked out on the destruction.

The explosion -- projection, I’m sure Amaryllis would have corrected me -- had happened at the far end of the room, a cascade of void that had, for a start, removed all the air from the room. The railings on the upper levels were gone, along with a significant portion of the upper levels themselves. Pieces of building were raining down from where supports had been removed or weakened. The brass Colossus was completely gone. The floor was missing too, scoured down at least a few feet by the void cascade, and though I couldn’t see the ceiling from my vantage point in the hallway, I had no doubt that was gone too.

“Neat,” said Fenn. “I’ll take a dozen more of those, please.”

I stared at the destruction in amazement as Fenn began gathering the barriers back up. “Okay, I’m still a little pissed off about you keeping that secret, but the results of the actual work speak for themselves.”

“It’s indiscriminate,” said Amaryllis. “We won’t be able to use it unless we want to kill everyone or everything in a pretty large radius.”

“And when do we not want that?” asked Fenn with a cheery smile. Her eyes widened slightly. “Think about how great that would have been in the forest!”

“We could have used it at the entrance to this place,” I said. “If I’d been informed of its existence.”

“I apologize,” said Amaryllis.

“But would you do it again?” I asked.
“Yes,” said Amaryllis, unflinchingly fast. “We can talk about that later, when we’re safe.”

“I told you that she said she’d slit my throat if she had to,” said Fenn. “Shouldn’t be much of a surprise.”

“When did I say that?” asked Amaryllis. I imagined her furrowed brow beneath her helmet.

“Unicorn blood,” said Fenn.

Amaryllis sighed. “Juniper, there are certain things that are dangerous to so much as know, and if I knew any of them, I wouldn’t tell you those either, and you would probably agree with that, right?”

“Infohazards,” I said with a nod. Of course Aerb had infohazards, why would it not? One of the Thirteen Horrors I had a quest for was [REDACTED]; that was his name given in both the quest text and the description I’d read in The Exclusionary Principle, Seventh Edition, complete with brackets. It was heavily implied that he got more powerful the more you knew about him. To me, that hadn’t implied an entire class of memetic threats, especially because he was in an exclusion zone, but apparently I should have just assumed that Aerb would contain every single thing I had ever thought of, so long as it was at least loosely within the genre.

Amaryllis pulled up short. “You don’t have infohazards on Earth,” she said, more as a statement of fact than a question, but there was a note of puzzlement in her voice. Someone, somewhere, must have done an investigation of the dream-skewered in order to make that determination, which was sensible if infohazards existed. “They were a thing you invented?”

“No, just copied from elsewhere;” I said. “I mean, I did invent some, and --” I pulled up short. “Obviously those specific ones can’t be here on Aerb, because I know about them and no horrible fate has befallen me yet, but just to be safe I’m not going to ever write them down or say them.” Everyone was staring at me. “I didn’t use it often, because it’s hard to work into games where there’s this player and character split that you can’t really get around. There are, were, maybe five in total.” I stopped. “And anyway, Arthur would have known about all of them, right?” I stopped again. “Okay, leaving that aside, because we can’t talk about it or do anything proactive about it, if you ever have any information that you think will hurt me -- that you think will hurt me in ways that I don’t want to be hurt -- then I promise that I’ll try not to be salty about it, if and when I find out that you were keeping a secret from me. That doesn’t apply to your attempts to manipulate the narrative though.”

“We’ll talk about it later,” said Amaryllis, which really wasn’t the sort of answer that I’d been hoping for, and to cap it off she began walking toward the wreckage where the Colossus had been standing. I might have objected more, if I wasn’t trying to stop thinking about the cognitive hazards that might actually be real on Aerb.

“And you,” I said to Fenn, partly to distract myself. I was worried, but not that worried, because if the five infohazards I’d made were already being carried around in my head, then it was already too late, and thinking about it would make it worse.

“Hey, you know that I like secrets,” she said. “And I have a flair for the dramatic, and she made some very convincing arguments, so really, I’m kind of still on her side.”

“Well, we’ll talk it over,” I said.

“I mean, it worked, didn’t it?” asked Fenn. She hefted her bow and began following Amaryllis.

“It might have worked anyway,” I said. “We’d have to figure out some way to double blind it, or at least do A/B testing, but I don’t have any clue how that would work in practice given all the
“Golems,” said Grak, with his monocle to his eye. “They’re coming to meet us.”

I was expecting another parlay, because the prison knew that we were stronger than it. Given that, talking was to its advantage. I wasn’t about to say that we had this place dead to rights, given the close calls, and given what happened to Solace, but it seemed to me that if I were a magical sentient prison, I would start in on negotiations so that I could escape with as little damage as possible. All we wanted was a single prisoner, and we were demonstrably willing to tear apart the prison to get him, so wasn’t it better to just hand him over? Of course, there was a school of thought that said you should never give in to blackmail or coercion, because that means that everyone will know that blackmail and coercion work on you. Which, when I thought about it, might have been why dozens of dirt golems were coming our way.

Most of them were like the ones we’d fought in the courtyard outside, simple creations with metal eyes I didn’t really understand the point of, given that the ones with only a mouth seemed entirely capable of navigating the prison without sight. It wasn’t that they didn’t worry me, but I at least knew that I could handle them in numbers, so long as I stayed in the open and didn’t let them wear me down. We’d fought them before, after all, and the second time was almost always easier, because you’d already done the hard work of getting educated on how the enemy moved and operated.

But unfortunately, it wasn’t just the dirt golems. I’d known since the game had called it a basic dirt golem that there would be variants down the road, and now I got a look at a few of them as they came our way. I saw a few adorned with vines and moss threaded through their dirt, along with a handful of flowers, and immediately suspected them of being casters of some sort. The others, of which there were two, were big, hulking creatures that moved around on all fours with large knuckles against the floor. They were smaller than the gate golem had been, but still big enough that there was going to be a real risk to getting within their reach.

“Go or stay?” asked Amaryllis.

“Stay,” called Grak, who was already drawing a ward at the end of the hallway, where the void cascade had done its damage but not removed the walls and supports completely.

“I’m less effective when pinned in,” I said, stepping beyond the ward he was putting in place. The ground got lower as we went further, which meant that we’d be fighting in what was essentially a wide pit made of stone where the prison no longer had any foundation and the void had hit the rock that island was made of. It was surprisingly smooth, given what must have been the chaos of the cascade.

The dirt golems weren’t terribly fast, but we only had seconds. Amaryllis stepped up beside me with her sword drawn. I took some comfort in knowing that even though we had our arguments, she would be there fighting with me without any hesitation.

“We’ll stay closer this time,” she said. “You keep up with the sweeping strikes, I’ll get the ones you miss.”

“And I’ll stay safe behind the barrier,” said Fenn, as she fired an arrow at one of the plant-adorned golems, the opening shot of the fight. The golem continued forward with an arrow stuck in it, slowly leaking mud as it trundled toward us.

(We could probably have run away, given that we were faster than them, but going on the run wasn’t the path to winning, not when we didn’t actually know where we were going, and not when the prison had plenty of opportunity to set up traps and ambushes in places that it could conceivably
My own first strike was made with the full weight of blood magic, pushing the strength of my pulse down both my arms and swinging my enormous sword so hard it whistled through the air. I cut clean through two of the golems and into the midsection of a third, where my sword lodged only briefly until I shrunk it down and pulled it free to gear up for another swing.

**Basic Dirt Golem defeated!**

**Basic Dirt Golem defeated!**

**Basic Dirt Golem defeated!**

**Achievement Unlocked: Triple Kill!**

I was watching the golems as I cut into them, paying more attention than last time and trying not to let adrenaline overwhelm me. They had sacks of brown goop inside them, and they began to fail when that goop started leaking out, but they didn’t actually stop moving until some critical amount was lost. That didn’t actually help my fighting style too much, but I was pretty sure that it was going to be important for fighting the big ones -- who had been going slow on purpose, it turned out, so that they could put on a burst of speed that nearly caught me off-guard.

I rolled away beneath a massive fist and came up with another hard swing that took down another dirt golem, rewarding me with a message from the game, then turned back to face the gorllia-golem, which was pounding along on its knuckles to close the distance between the two of us. I moved back again, which unfortunately put distance between Amaryllis and I, but that was nearly unavoidable, and it was clear that our plan of fighting back-to-back wasn’t going to work out.

I came at the gorilla golem with another of my strongest swings, putting everything into it that I could short of burning through a bone. I cleaved cleanly through its arm, but it lifted the stump up and slammed it back down on the severed fist, cleanly reconnecting them, then swung at me hard with its other hand, narrowly missing me as I jumped backward. I lunged in close, riding the pulse of my racing heart, and slammed my sword straight up into its gut. I changed the shape of the blade while it was inside him, giving the part of it that was lodged in the goop barbs and curls, then ducked down to avoid another hit as the golem slammed a fist against its own chest. It took all my considerable strength to yank the sword out from the golem once I got my footing, but I was rewarded with a thick splash of its semi-liquid innards on my feet as parts of the packed earth broke away. I managed to scramble out from under it as it collapsed.

**Brutish Dirt Golem defeated!**

Amaryllis was dancing through the dirt golems, out-maneuvering them, getting away from their strikes, making the plate armor look like it was a featherweight, and occasionally stopping stock-still for a split second to let her armor lock in place and take the hit without much risk to her. She was doing better than in the previous fight, with a more defined rhythm and flow. I was hopped up on adrenaline and the thrill of battle, that urge to scream and roar over the corpse of the thing I’d just taken down, and watching her, just for a moment, filled me with something like pride.

And then I was back to murdering dirt golems in the pit, trying to put my blood into every movement and end the fight as quickly as I could. I pulled from the bones in my bandolier from time to time, usually **END** to stave off exhaustion, since the powerful swings I was using took an enormous amount of energy, especially with my sword as large as I was making it. We were cutting through the ranks at speed though, and dozens weren’t enough to stop us.
There were a few things that I’d failed to pay the proper amount of attention to. The first was the flower golems, which were staying back, but I did see an arrow zip toward the air toward them from time to time, and so long as they weren’t actually doing anything, I wasn’t going to move to engage with them. My best guess, to the extent I had the mental energy to guess, was that they -- and the brutish dirt golem that stood near them -- were waiting for us to get worn down.

The second thing I had failed to pay the proper amount of attention to was the water collecting at the bottom of the stone bowl the void cascade had carved out. I could see where the water was coming in from pipes that had been severed, and while there hadn’t been any water when the fight had started, it was easy to chalk that up to the esoteric systems of the prison, had I actually had that much time to spend thinking about the water. As it happened in my head, all thoughts were woven into the flow of my sword, the rhythm of my pulse, and the full-sensory absorption of the fight.

The first sign that anything was wrong was all of my muscles contracting at once (life tip: this is a pretty big sign that something has gone wrong, even if you’re not in the middle of a fight). It was painful and hot, like my whole body was being vibrated, and I was vaguely aware of having dropped my sword as I pitched over into the water, which only increased the hot pain. It didn’t last for long, but as I started to recover I was punched in the head, hard, by one of the dirt golems, and more of them were moving to surround me as I tried to shake that off too.

I touched a bone and pulled SPD from it, launching myself to my feet and slipping out from between the golems, but I wasn’t fast enough to escape without another hit to my armor, and I stood up, limping slightly and unarmed as the golems moved on me. A quick glance showed that Amaryllis had stayed on her feet, but she must have used her armor to do so, because she had been swarmed by the golems, who were beating against the immobility plate. It was, so far, holding steady, but the second big gorilla golem was finally making his move down to us. He was leaking brown goop from where a dozen arrows had hit him, but that didn’t seem to be slowing him down any.

“Casters!” shouted Fenn, from behind the protective ward that still seemed to be holding. I whipped my head to look at the two golems with vines just as one of them flicked something in my direction, and at that moment I felt the tug of luck on me; I touched my wrist, where the tip of a tail was showing, and pulled out a snake that I swung into the path of the small blue bead that was tracking my way. The projectile hit the snake, which immediately burst into spikes that came up from its skin. It looked terrifying and impractical as it fell into the water, and I could imagine that if I survived such a thing, I’d be half the fighter I needed to be.

Fenn called out to me and threw me a shortsword, one that we had taken from Aumann’s vault and then never actually figured out, though we’d done everything short of brute forcing magical phrases or using it in combat. The grip was a dark, hard wood with grooves for the fingers, while the blade was bluish-silver metal with rivulets in it. It was decidedly not my preferred weapon, but the Anyblade was at the bottom of the pit and probably under quite a bit of mud. With my off-hand I went to pull my returning dagger from my bag, but realized only belatedly that it had fallen off and was lost somewhere in the mud. Worse, something was slipping side-to-side within my hand and one of my fingers wasn’t working; there was only a faint echo of pain at the feeling of broken bones. Great.

I dashed toward the gorilla golem as it approached Amaryllis, leaping up and stepping on a few of the dirt golems to get there in time. Without the Anyblade, it was going to be a lot harder to take down, and now I was on an unfavorable footing, because I would have to protect Amaryllis too. I leapt five feet up in the air with Sanguine Surge and brought the blade down hard on the golem’s left shoulder, putting all my weight behind it.

Critical hit!
The arm fell down to the ground with a solid thud, and I slipped past the gorilla golem, taking a few hits from the smaller ones we’d mostly cleared out in the process. I stabbed through one of them, hard enough that it wouldn’t have time to do much before its goop spilt out. I planted my other hand firmly on the back of the brutish golem, feeling a too-faint twinge of pain in the process, and activated the tattoo I had readied; the Icy Devil began doing its work, chilling down the earth under my hand.

I tried to keep my hand in one place, but there were still enough dirt golems to be a problem, and the big guy tried to slap backwards with his intact arm, which I was forced to duck down from. I fought with the sword, facing down the few remaining dirt golems that hadn’t swarmed Amaryllis, keeping my hand in place as the temperature in the room dropped. I waited as long as I could, then saw the vine golem toss something small and white toward me, which I took as my cue to make my move. I spun around and drove my shortsword into the golem with all the power I could muster, aiming right for the cold spot. I was rewarded with a hard crack as the frozen earth was destroyed, and goop came pouring out of it.

**Brutish Dirt Golem defeated!**

And then my field of vision was overtaken with butterflies, small white ones, which went for my face and flapped there. It was only when I tapped SPD from a bone (using my chilled hand, sending a wave of cold over myself in the process) that I was able to swat them away enough to see that they weren’t butterflies at all, only white flower petals acting together like butterflies.

I took a hit from the side, at a place that must have taken a few too many hits before, because that one I felt, even though my ribs were almost as numb as my hand. I went tumbling to the side, down into the water, and the butterfly petals raced to follow me as the few remaining dirt golems moved toward me. I had some unpleasant flashbacks to the fairies we’d had to fight back at Caer Laga, and I still had no good defense against it. These, at least, were a nuisance, without the sharp teeth or ability to tear my skin. That said, there were a lot of them, enough to block my field of vision, and that was enough for me to take another hit, this one to the chest, which left me sprawled in the water for one dazed second before I got back to my feet.

From there I was trying to fight blind, listening to the cacophony of sounds and trying to make out from the water where the dirt golems were. I had to hope that the remaining caster had been taken out by Fenn, because while I could out-maneuver the golems, I couldn’t respond to the seemingly random effects of what appeared to be a golem that knew flower magic. My sword connected on occasion, and then eventually got stuck, which left me trying to swat away the butterflies as quickly as I could just so I could get a sense of where the golems were and move out of their way. There were messages popping into my field of view, with more of the dirt golems defeated, and I had to hope that whatever my party members were doing, it would be enough.

And then, with a final clearing of my eyes, I saw the last of the dirt golems fall, revealing Grak standing there, breathing heavily and clutching his axe. Fenn was down in the water, next to Amaryllis, who was surrounded by mounds of dirt but seemed unharmed.

“That was a slog,” I said. My fingers went to one of the bones in my bandolier and I started the healing process. I could already tell that I was going to need more than I had on me, but that was why we had a lot of bones ready to go.

“I’m fucking useless against those things,” said Fenn. “Even with a broadhead it takes half a dozen shots to bring one down.”

“I spent most of that fight trapped in my armor,” said Amaryllis.
“They shouldn’t have had other magic,” said Grak. “It was flower magic.”

“Well, they had it,” I said. “That’s fun. I’d guess that we can expect more of it. Are we safe for now?”

“I’m not getting the sense that we should move,” said Fenn. “The hallways are clear, anyway. And if I were the prison, I would have gone at us with everything I had the second time around.”

“Heal me,” said Amaryllis. “Please.” She took off her helmet and revealed a bloody face, with most of it dripping down from her nose to her mouth, and a few places where there was some swelling.

“Bones,” I said to Fenn.

“So Mary was polite,” said Fenn, as she started handing me the bones stored in her glove. “She said please. Can’t you even say please to your wonderful girlfriend?”

“Please,” I said as I approached Amaryllis. I reached forward with my right hand and gently touched Amaryllis, with my fingers on her neck and my thumb touching her jaw. It was awkwardly intimate, the same as it was every time that I had to heal her. As I pulled the energy from the bone out and pushed it toward her wounds, I watched her face puff up more, go red, become bruised, and finally return to normal as I went through the bones. “Where else?”

“Left forearm,” she said. She wasn’t looking at me, instead staring up at a random spot away from me, which had always been my strategy with the dentist so I didn’t have to look into their eyes. I could see the dent in her armor where she must have been hit hard enough for at least a hairline fracture. Doing the healing from a distance like that was more difficult, but I’d gotten fairly good at directing the magic where I wanted it to go.

“We’re being worn down,” said Grak.

“Yes,” I replied.

“Not much longer, if they were guarding this way,” said Fenn. “Just another two or three more fights like that, until we have to fight Fallatehr and all the copies he made of himself, which will be its own thing.”

“We’re not going to fight Fallatehr,” said Amaryllis. She briefly glanced at me. “We shouldn’t want to, anyway. If we do, we’ll have to make sure not to kill him. The whole point is that we need his expertise.”

“Just saying it seems likely,” said Fenn. “And he seems like an asshole.”

“Any other healing?” I asked. Amaryllis shook her head. I began the process of healing myself; the pain was becoming sharper as the urgency of combat faded, but the pain was good, in a way, because it was a reminder that I could still feel something from my injured hand. I had a hunch that the healing process was exacerbating the condition of my hand, but the bones were so brittle now that they kept breaking.

“We should go as soon as you’re done,” said Grak.

“Many miles to go before we sleep,” I replied. I waited for Grak to correct me and tell me that it wasn’t actually miles, but I guess he was starting to understand when I was making a reference, because he simply turned away. “Do you think it gets harder or easier after that?”

“Harder,” said Amaryllis. “You always said that you pushed your players just to their breaking point,
when it balanced on a knife edge.”

“And sometimes past that,” I replied with a nod. “I don’t know that’s a good heuristic for what we’re going to find in this prison. We shouldn’t count on the whole thing shifting around us just to accommodate a more pitched battle. And we really shouldn’t count on any given battle being fair, or doable.”
Animus

We didn’t have another major fight, but we did have skirmishes, four of them as we went through the prison trying to find the gymnasium, or failing that, the cell where Fallatehr was kept. Three of those were against the brass creatures, which we mostly dealt with from as far a distance as possible. If you assumed that everything was out to kill you, it wasn’t actually that hard to deal with a dungeon, just time-consuming. We burnt through more bones for some healing and took a few bangs and scrapes, but came out relatively unscathed for our troubles. There was no real drama or tension battling the security system. It was good, but we were better, and we had killed the Colossus, apparently the largest, most threatening thing that it had, in a single swift show of immense force. If there was another, we didn’t see it.

I was worried about how long it would take the dungeon to start making fresh golems, and whether it was rebuilding its forces, but we didn’t see much more of them as we went deeper into the prison, nor when we started backtracking because we realized we’d gone the wrong way. We did fight a few more, but there were only a few of them, and they seemed like they were inartfully trying to lead us somewhere, so we took a different path instead.

And just like that, we stumbled into the gymnasium. My attention was immediately drawn to the people and the equipment in the center of it, but the room itself was also of note, another place with one of the many high domes the prison seemed fond of. The major difference here, aside from the fact that it was the first place that had actual people in it, was that the walls had enormous, intricately done murals that depicted elaborate battle scenes I didn’t quite find appropriate in a prison. The sun was setting, and the light coming through the glass roof was dim, which meant that most of what I could see was thanks to a greenish luminance from the lit wall sconces.

But it was the people who drew my attention, fifteen of them, all turned our way as we crept into the room. Most of them were elves, but there were other races too, an insectoid with a multi-hued carapace that had been scored with lines, a man with bumpy grey skin I recognized as one of the vlere-gur, and a woman who stood nearly seven feet tall and didn’t belong to any race I could recall making or reading about. I eyed them all carefully, scanning for signs of a threat.

A brief smattering of applause came from one of the elves, who began making his way towards us as his hands fell to his sides. “Congratulations!” he called across the distance from the center of the gym to where we stood by the door.

“Thanks!” Fenn called back.

“There was some discussion about whether you would make it!” he called, closing toward us quickly.

If this was Fallatehr, and there was no guarantee that it was, then he was very dangerous. And if it wasn’t Fallatehr, then he was almost certainly sending someone dangerous toward us. I tried to take in his face and kept having my eyes drawn to his pointed teeth, which seemed ready and willing to rend my flesh. He was tall and somewhat effeminate, with long, pointed ears, which I more or less expected from an elf at this point. His face was lively though, more animated than I had seen from any elf but Fenn, and she didn’t really count. Unlike the one we’d seen in the visiting room, this one didn’t seem to have any of the intricate scars used in scar magic, though his chest wasn’t visible to us. He wore white, with a high collar and no sleeves. The hem of the shirt hung so low that it was almost a dress, though he had white pants beneath that.

“Are you Fallatehr?” asked Amaryllis.
“Are you Amaryllis Penndraig, most direct descendant of Uther Penndraig, and Princess of Anglecynn?” asked Fallatehr. I wasn’t certain that it was really him, but I thought that the odds were good.

“I am,” said Amaryllis, removing her helmet and holding it under her arm at her side. “We seek Fallatehr Whiteshell. We spoke with one of your … associates.” The pause wasn’t because Amaryllis was searching for the word, it was a deliberate sort of hitch in her speech that let him know she was choosing to be diplomatic, the classy way of making quote marks with your fingers.

“Yes,” said Fallatehr with a nod. “I am the man you seek. Explain to me why I should help you.”

“How much can the prison hear?” asked Amaryllis.

“In this place she has been rendered deaf,” said Fallatehr. To my surprise, I realized that he had a lisp; the ‘th’ sound was coming out awkwardly, or replaced entirely by something that sounded similar. ‘Uther’ had become ‘Oo-her’. I could imagine how that was a hard sound if you had to stick your tongue against pointy teeth, but couldn’t remember the other elf having that problem.

“Then we offer you escape,” said Amaryllis. “If your associate relayed our message accurately, then you know that we want you for a teacher. In exchange, you would go free.”

“Your ancestor, the one I knew, how many generations back was he?” asked Fallatehr. “Six? Seven?”

“If you mean Cyclamine, then three,” said Amaryllis. “He was my great-grandfather.”

“Far less than I expected then,” said Falltehr. “And do you know what our relationship was?”

“As far as I’m aware, he tried to save his family and his legacy when the regime change began,” said Amaryllis. “If there was any bad blood between the two of you, I haven’t heard about it.”

“We weren’t close friends,” said Fallatehr. “I knew him, and knew that he would do nothing for me, because there wasn’t enough incentive for him.” He clapped his hands once. “You and I aren’t close friends either.”

“The question of trust and incentives is an admittedly difficult one,” said Amaryllis. “Do we have time to talk? Will the prison take action against us here? Will it try to move you?”

“You’ve upset Amoureux greatly,” said Fallatehr. “But she has also been beaten into a temporary submission. I put a great deal of work into her over the years, bending and changing her, and I hate to say that you’ve upset all that. What she sends against you next time won’t be so softened.”

“There’s not going to be a next time,” said Amaryllis. “We can leave now.”

“How?” asked Fallatehr.

“We have a teleportation key,” said Amaryllis.

Fallatehr was silent for a moment, which he spent staring at Amaryllis, his eyes twitching fractionally as he looked over her face from a distance. “Anglecynn truly wants me?” he asked.

“No,” said Amaryllis. “We don’t speak for Anglecynn, nor act on the behalf of the kingdom.”

“Ah,” said Fallatehr. “Strange that a princess does not speak for her country. No pardon is on offer then? The crime I was put here for was, after all, only a crime after the fact.”
“It’s not within my power,” said Amaryllis. “If it were, I would offer that pardon.”

“Alright,” said Arthur, “Let me do the talking.”

“Me no talk good,” said Tom, with his best half-orc impression.

“But I want to talk,” said Tiff.

“Arthur has the best rolls,” said Reimer.

“Sheet,” said Tiff, holding out her hand. She had only recently learned that people would just hand over their character sheets if she asked, after having mistakenly believed that this was private information, and she was taking advantage of being able to look over what other people had done. Arthur handed his character sheet over with a smile, and Tiff narrowed her eyes as she looked at it. “Okay, that’s ridiculously good, but you’re lawful neutral, I’m chaotic good, I can’t let you do all the talking.”

“You don’t trust me to represent the average of the group view?” asked Arthur.

“First, no,” said Tiff with a laugh, “Second, that takes all the roleplaying out of it, doesn’t it? If you’re the one that always talks, then the rest of us are just, at best, talking out of character.”

“This is going to be a clusterfuck,” groaned Reimer.

“Well I think it’ll be fun,” said Tom.

“I didn’t say that it wouldn’t be fun,” replied Reimer. “Joon, I’m going to apply drowfire poison to my daggers before we go in. I have my special sheaths, so I should be able to keep them concealed.”

“Oh, sounds good,” I replied as I made a note in my scratchpad.

“What does the average of our values mean?” asked Maddie.

“Ugh, please no,” said Reimer. “Never let Arthur --”

“What I mean is that all of our alignments could potentially be plotted on a two-dimensional grid, like so,” said Arthur, sketching two quick lines in his notebook and giving them simple, one-letter labels. “The C-L axis is Chaos and Law, the G-E axis is Good and Evil. We can use this to map everyone in the group.” He made six quick points on the piece of paper. “And with some more lines, we have the basic alignment grid.” He drew in four more lines, two vertical, two horizontal, then held the paper up for our inspection. “So once we have that, we can average the points on the C-L axis, then average the points on the G-E axis, which would give us a new point about here,” he poked the paper in roughly the center of the dots, toward the corner of the square that would traditionally be labeled ‘neutral good’.

“Objection!” cried Tiff, who had been watching let’s plays of Phoenix Wright (she did this instead of playing them, it was weird). She jabbed a finger at her character sheet. “Cleonia feels very, very strongly about chaos, and if you were just averaging alignment, then you’d get people like Plunder -- that is such a ridiculously stupid name --”

“Thank you,” said Reimer.

“People who don’t care about the abstract concept of law at all get counted the same in the average,” continued Tiff.
“They do,” said Arthur, “You’d assign a numeric value to each of the alignments --”

“No,” said Tiff. “It’s like, if we were talking about abortion, --”

“No, please, please, not again,” said Craig with a groan.

“You can hold the same pro-life beliefs as someone else, but feel it less strongly than they do,” said Tiff. “There are people who have some particular position on abortion as being central to the core of their identity, and there are other people with that same position who only really put forward their position when pressed about it.”

“So there are some people who are firmly neutral, and others who are wishy-washy about their neutrality,” I said.

“Point taken,” said Arthur with a frown. “I mean, we can fix that by making each point into a vector instead, and then averaging the vectors, but the alignment system is just notional anyway.”

“No, it’s not, it’s mechanical,” said Reimer. “If you can detect it with a spell, then it’s not just a norm.”

“Sure, fine,” said Arthur. He looked down at his graph. “The real problem is that for any given issue, we would need to figure out what everyone thought about it, and then how strongly they felt, and then as the voice of the group, because I have the best rolls, I would deliver whatever that position was to the NPCs.”

“Which wouldn’t work, because half the time conversation is about getting information from someone rather than delivering it to them,” I replied. “So with every line I deliver, you have to go back to the group and see their individual reaction to it, then synthesize a new position based on the change.”

“So we’re agreed on me talking?” asked Tiff. “Not a free-for-all, but if Arthur doesn’t do a good job of representing the truth and beauty of medieval ancap?” The historical context was really more like Early Modern Period, borrowing from the Scientific Revolution, but I refrained from making that correction.

“It doesn’t matter,” said Craig. “Joon can force the issue, and in-character there’s usually a reason to not let the snake oil salesman be the only one you talk with.”

“None taken,” said Arthur.

“Actually,” said Reimer, “The real reason it doesn’t matter is that we’re never actually going to get to that part of the night where we actually talk to anyone.”

“And you?” asked Fallatehr, turning his attention to me. He glanced down at my hand. “You’re the bone mage whose soul is in such dire need of fixing.”

“Yes,” I said, not fully trusting myself to speak. I had no idea whether Amaryllis was actually sympathetic to him, or whether her plan was to murder him outright as soon as we got what we wanted from him. I hoped that I wouldn’t give her away just from the fact that I was still terrible at lying.

“I can fix it quickly, if you’d give me a few minutes,” said Fallatehr.

I glanced at Amaryllis for help. “I don’t think that would be wise,” she said.
“You want me to teach someone the technique,” said Fallatehr with a nod. “I receive so little information from the outside world these days, is the nature of the soul still so taboo that you would need me?”

“Yes,” said Amaryllis. “You might be able to change that, if you left this place.”

Fallatehr barked laughter, and it was one of the uglier sounds I had heard come from an elf. “Oh, I’m not yet sold on the idea of leaving,” said Fallatehr. “Not only is there the chance that it would be bad for my health, but I have quite the life here, with associates that I’ve spent decades crafting to perfection.” He gestured behind him, where the others were standing. Some were talking amongst themselves, which I took as a good sign; they didn’t have telepathy, and didn’t work with unanimity of purpose.

“Is there another arrangement that we could come to?” asked Amaryllis. “I wouldn’t think that you would have everything here that you could want.”

“Why wouldn’t I?” asked Fallatehr. “I know this prison very well, I control the levers of everyone inside it, I can move around with near-impunity, and I have already had much time to acquire creature comforts. I was never as concerned with the frivolity of the material as my brethren.” The heedlessness with which he lisped through the ‘th’ sounds was grating on me.

“That’s bluster,” said Amaryllis, keeping her tone flat. “There are things you want. We have a teleportation key and the capacity to get those things for you, even if you don’t wish to leave.”

“I didn’t say that I didn’t want to leave,” said Fallatehr, “Only that I was not sold.” He drummed his fingers on his chin, then looked to me. “Who would I be teaching?”

“Me,” I said, staring him down. “How long does it take, for someone to manipulate his own soul?”

“For a human?” asked Fallatehr. “Years, but not more than a decade.” He narrowed his eyes at me. “Are you human?”

“Yes,” I replied, but I had a hunch what the next question was going to be.

“You are young, to have gone through the athenaeum,” said Fallatehr. He looked at the hand again. “You’ve made some attempt at healing, before coming to me. The bones have been cut out and regrown.”

“Not intentionally,” I replied. Fallatehr raised an eyebrow at that. I was hoping that being vague and mysterious would get him interested, on a professional level if nothing else.

“The body tries its best,” said Fallatehr. “It would be simplicity itself for me to fix what’s wrong with you. I’ve done it dozens of times before.”

“I’d prefer to learn on my own,” I replied.

“And spend years of your life to do so?” asked Fallatehr.

“If that’s what it takes,” I answered. I was hoping that it would take hours, but maybe that was a little bit unrealistic. I couldn’t say that I thought it would take hours, because that would demand an explanation that I didn’t want to give, and I already thought that Amaryllis was being a little loose with what information she was giving up. I didn’t doubt that she had a plan, but my plan hadn’t involved telling him that we had a teleportation key until we had to.

“And you, quarter-elf,” said Fallatehr, addressing his attention to Fenn. “Why do you travel with a
“I don’t think that’s germane,” said Amaryllis as quickly as she could.

“If I’m to be teaching this one for years on end, of course it is,” said Fallatehr with a frown. “We’re speaking of a long-term arrangement, and it would, of course, behoove me to know more about who you are and what you want, even if your prodigy can learn what he needs to know in months, not years.”

“Sharing information goes both ways,” said Amaryllis, with a glance back to the people still standing in the center of the room.

“I have you at a disadvantage,” said Fallatehr, “I see no point in pretending otherwise.” I felt pained at that; I didn’t really believe that he was content to stay here, even if he’d had his way with the prison, but it was clear that he was willing to walk away from our escape, which wasn’t at all what I’d been hoping for.

Amaryllis nodded, and gestured toward Fenn.

“What is it you’d like to know?” asked Fenn. Her enunciation was more perfect than I had ever heard from her before.

“You’re a half-elf?” asked Fallatehr. “Descended from wood elf stock?”

Fenn nodded. “My father was an elf from the Isle of Eversummer. My mother was a human.”

“And what is your role in this group?” he asked. The unself-consciousness of the way he spoke was unsettling me, given his lisp. He didn’t trip over or slow down for the word ‘this’, he simply spoke it incorrectly and continued on.

“I’m our ranged specialist,” said Fenn. She didn’t have her bow drawn, which made the statement a little farcical, but there were lots of ways to be a ranged specialist without having visible equipment, at least on Aerb, and hopefully being enigmatic would keep him guessing, or at least force him to ask another question.

“How old are you?” asked Fallatehr.

“Thirty-three years old,” said Fenn.

(That was quite a bit older than I had thought, and my brain had an irrational moment of uncomfortability and panic at our age difference. It didn’t actually matter, it didn’t make her a different person, I’d already known that she’d spent a few years in prison. I hadn’t asked, because it didn’t seem important, and if it wasn’t important enough to ask, then it wasn’t important enough to think about once I knew.

And I immediately began spinning up reasons that her being that old was actually a bad thing, because that was how my brain worked. She’d left the elves for good at the age of seventeen, after they’d scarred her, which meant that she’d been on her own for nearly sixteen years. I guess in my mind there was an acceptable length of time to go bumming around the Risen Lands looking for loot, where a few years was just a matter of finding yourself, and a decade and a half was more just who you were. And there was, too, the question of Fenn’s immaturity on both an emotional and social level, the jokes that she used to cover her insecurities and weaknesses, the way she kept her guard up, even around me … I had thought that I would help her, and she would help me, and we would grow together, but there were sixteen years of her mostly being the same person without changing much, and six partners over the course of those sixteen years meant that her issues with intimacy and
how gun shy she was about relationships were also more serious than I had thought.

Really, I was probably just carrying over cultural conceptions from Earth about what age ranges were appropriate. That had been something I’d been sensitive to for a long time, ever since a few girls in our class freshman year had dated seniors, and the age gap between them had rankled, partly because I’d had a crush on one of them. That got added to the standard Midwestern cultural programming package, which would have considered me, at seventeen, dating a thirty-three-year-old woman as incredibly scandalous.

This was all very incidental to the powerful soul mage standing in front of us, but that didn’t do much to keep the cascade of thoughts from running through my head.)

“You’re a pup, then,” said Fallatehr. “An outcast from elven society, I would wager, like myself?”

Fenn shrugged.

“Not the talkative type then,” said Fallatehr with a slight frown. Amaryllis coughed, which didn’t hide her momentary smile from me.

Fallatehr looked at Grak only briefly, but apparently had no questions for him. Elves and dwarves didn’t have any inborn animosity on Aerb, contrary to the traditional fantasy cliche, partly because they occupied completely different niches within the sociocultural ecosystem.

“Very well,” said Fallatehr, looking back toward Amaryllis, “I would like some time alone with the prodigy, to gauge him as a student.”

Amaryllis nodded, and gestured for me to go forward. “Away from the others, of course,” she said with a glance toward the cluster of people in the center.

“So little trust,” said Fallatehr with a frown, but he began walking to a different corner of the gymnasium all the same. I followed after him, suddenly feeling nervous. This was a man that I would need some kind of working relationship with, if I wanted to learn his secrets, but he currently had some strong incentives to hold me hostage. Elves were stronger and faster than people, and their luck grew as they got older. I had never fought an elf before, unless you counted sparring with Fenn, and that uncertainty was one of the primary sources of my apprehension.

Fallatehr led us behind a small folding screen, where two chairs were set up, along with a variety of equipment on a simple tray. I recognized the runic nail like the one I’d used to collect souls in Comfort, and there was a variety of glass equipment, along with a few other things that I didn’t recognize, and a few pieces of mundane doctor’s equipment I was familiar with, like a speculum.

“I didn’t catch your name,” said Fallatehr. He sat in his chair with his legs folded and his hands clasped over his knees.

“Juniper Smith,” I said. I was watching him closely and listening for suspect sounds from beyond the screen.

“And it’s you who will be my pupil?” he asked. His eyes roamed my face and rested on my deformed hand. I tried not to join him in looking at it; I knew what I would see there, skin stretched and sagged in places, each knuckle just slightly off from the right length, either too long or too short.

“Yes,” I said. “If you’ll have me, if we can come to some sort of arrangement.”

“What was it you were doing, when you reached down through your marrow and touched your soul?” asked Fallatehr with a raised eyebrow.
“I was running for my life,” I said. “I needed the swiftness.” Swiftness was the bone mage name for SPD, and I wasn’t about to reveal myself to him if I could help it. I held up my hand so he could see it. “I used every bone, and even then I only barely lived.” I wasn’t going to tell him about my ribs either, I had decided, not until I knew how to fix my hand.

“It might be easier to work with you, given how you’ve disfigured yourself,” said Fallatehr. “How old are you?”

“Seventeen,” I replied.

“How old were you, when you began studying at the Athenaeum of Bone and Flesh?” asked Fallatehr.

“You’re assuming that I studied there,” I replied. I could feel his eyes watching me. I knew that I was going to present him with a number of facts that weren’t going to make much sense, but not only was I terrible at lying, I didn’t know enough to carry on a campaign of lies.

“And where did you study?” he asked.

“I had a teacher in Barren Jewel, if you know where that is,” I said.

“Outside the athenaeums,” said Fallatehr.

“That’s something that I’m seeking to do again, given the tight controls on the art,” I said. That much was truth, at least. I was scared of soul magic, but that didn’t mean that I didn’t want to learn it, and if this man was the most direct path, then so be it.

“Show me your bone magic,” said Fallatehr.

I grabbed a bone from out of my bandolier and held it in my right hand, then frowned slightly as I tried to think about the best way to demonstrate. I assumed that he wanted to get some understanding of who I was as a student, or possibly was trying to get some information from me. I didn’t really mind that too much; there were only a few things that I wasn’t going to tell him.

I ended up using the Anyblade to make a cut in my left hand, feeling almost no pain from it, and then healed myself immediately with only a trace of the cut remaining. I went slow, pulling steadily rather than trying to yank out all the healing at once, in order to maximize what the bone would give me.

“Satisfied?” I asked.

“And how long did you spend in study to attain that level of proficiency?” asked Fallatehr, leaning forward slightly.

Ah.

“You wouldn’t believe me if I told you,” I said. “I learn quickly.”

“How quickly?” asked Fallatehr.

That was a tricky thing to answer. It had taken me maybe an hour to go from Bormann’s simple description to being able to do it myself, and my current level of proficiency had taken maybe a month, at the most, though that was without a huge amount of effort put into actually learning anything. But the actual timeline wasn’t what made it tricky, it was that saying “I learned it in an hour” was unbelievable, and besides that, might betray a little too much of what I was. And if he did believe me, then he might realize that he wasn’t actually all that valuable, because we didn’t need years worth of training from him, we needed weeks, or maybe even mere days.

“It took me a month,” I said. That seemed like a fair compromise, startlingly quick, but maybe not
Fallatehr watched me, frowning. “Have you applied your quick learning to other tasks?” he asked.

“A few, I replied. “What we want from you won’t take years of your life, it will take much less, if that’s what you’re worried about.”

“I am not human, such that I worry about a few years here and there,” said Fallatehr. He was still looking me over. “Your other specialities, skin magic and blood magic?”

I hesitated. “Yes,” I said. I wasn’t sure how he had been able to tell about the blood magic. My veins were maybe a little more prominent than they might otherwise have been, if you had eyes keen enough to look me over carefully from a distance. As for the tattoos … well, that was obvious enough, if you looked down at my wrist. I hadn’t made an effort to hide them. Maybe I should have, but my tattoos were weak enough that I would rather project strength that I didn’t have instead of keeping a trivial trick up my sleeve.

“And others,” said Fallatehr.

“Yes,” I replied.

Fallatehr leaned back in his chair. “Have you surpassed your teachers?”

“Yes,” I replied. “Though I can’t say that I had particularly good teachers, so that might not say much.”

“And this prodigy, is it natural or magical?” asked Fallatehr.

“Neither,” I replied. It took place above the levels where natural and magical existed, that I was pretty sure of, though it obviously interfaced with those levels as well.

“Very well,” said Fallatehr, standing up from his chair. “I believe I find this intriguing enough to go along with, which I imagine was what you were going for. The princess has a handle on you --”

“She doesn’t,” I said. “We’re just friends. I let her do the talking and negotiating, because she’s better than me, but I wouldn’t think it smart to try to manipulate her as a way of manipulating me.”

“I’ve never held with manipulation,” said Fallatehr. “Far easier to simply stick your hand on someone’s soul to get them to do what you want.”

I swallowed at that. If he tried that with Amaryllis, I would stab him to death until he wasn’t much more than a pile of broken bones, raw meat, and ruptured organs, but I didn’t know whether he was the sort of person who responded well to threats. Then again, he was threatening me, or at least the people close to me, so maybe this was one of those occasions where displaying a willingness to inflict violence was appropriate. Too much time passed as I thought about it, and I ended up keeping my mouth shut.

“Come,” said Falltehr. “I believe the time has come to negotiate over the matter of my associates, now that I’ve decided you would make an interesting enough pupil.”

We walked back to the rest of the party, who were still standing close together. They had been talking, but ceasing their conversation as we approached. Fallatehr’s “associates” had moved somewhat, but they were still watching us.

“I’ve accepted the base offer,” said Fallatehr. “I will leave this prison with you and teach Mr. Smith
everything there is to know about the soul and how to manipulate it.”

“With reservations?” asked Amaryllis.

“Naturally,” replied Fallatehr. “And I have bad news, I’m afraid. The teleportation key you’ve brought in will not work, and this place will not remain safe for you for more than another hour.” Of course, because that would be too easy.

“The prison is not warded,” said Grak with a furrowed brow.

“It is an innate feature of this place, not a ward,” said Fallatehr.

“And you couldn’t have mentioned this earlier?” asked Fenn.

“It wouldn’t have been to my advantage then,” said Fallatehr, casting his gaze over her. She broke eye contact with him almost immediately, but his eyes continued tracing the lines of her body. Fenn had repeatedly assured me that elves found her extremely distasteful, but Fallatehr wasn’t exactly a typical elf, and he’d already said that he was an outcast. “In an hour, it will be curfew, and the prison’s appendages will come here. That’s not something that I can prevent.”

“The prohibition against teleportation doesn’t extend beyond the outer walls though?” asked Amaryllis.

“Not to my understanding,” said Fallatehr. He was watching the four of us like he was taking some entertainment from this. He’d agreed to leaving the prison and working with us, but we still didn’t have something that he actually wanted. To him, our failure would be a boon, and that was a serious problem.

“You said that the prison would bring us greater challenges on our way out,” I said. “Explain that.”

“There have been less than fifty prisoners here for the last hundred years,” said Fallatehr. “For the last six decades, I have been working on the penitentiary itself, uninhibited, gradually bending her to my will. The weakness of the appendages of dirt is a result of that. In another hundred years, I could have transformed this place into a fortress under my complete control.”

“Go faster, please,” said Amaryllis. “Time is apparently of the essence.”

“The prison is reactive,” said Fallatehr. “She rises to the threats that she faces. When there were two thousand unruly prisoners, she was fearsome. Given such a long span of a few dozen completely docile prisoners who she never recognizes as breaking rules, she has become the weak thing you faced in reaching me. And now, having been so thoroughly provoked, she will rise once again. How fast, I can’t say.”

“Shit,” Amaryllis swore.

“Yes,” agreed Fallatehr. “When you came here I thought that I would be happy enough to see you all die by the penitentiary’s hands, but Juniper has changed my mind on that score somewhat.”

“Then let’s get going,” said Fenn, folding her arms across her chest.

“There’s still the matter of the … associates,” said Amaryllis. That was more or less what it came down to. We’d been given a clock and told there was danger, but we were going to keep standing in this room, talking, until we could come to an agreement. “We can’t take them, the teleportation key only allows five.”
“Unacceptable,” said Fallatehr with a shrug. “My counter-offer is that we take all of them. You have free use of the key, it wouldn’t take more than six trips in total. It would naturally have to be done carefully in order to ensure that there’s no chance you simply leave them behind.”

“We can’t deal with that many people,” said Amaryllis. “Logistically speaking –”

“It’s about trust, not logistics,” said Fallatehr.

“Yes,” said Amaryllis. “You’re right, I apologize for not cutting to the point. We’ll move everyone at once, and if the far side of the island is safe from the penitentiary, we’ll extract everyone, including whichever associates you want to remove from this place. None of them will come with us. I’ll place them in whatever locations you prefer, so long as they’re distant from us.”

“Hang on,” I said, “You’re talking about releasing them into the world?”

“I’m negotiating,” said Amaryllis with a carefully calm glance in my direction.

“Ah, young Juniper doesn’t share your belief in the injustice of my incarceration?” asked Fallatehr.

“I don’t know the specifics, and I don’t think we have the time to talk about them,” I said. “Your associate we talked to made it clear that your associates aren’t actually you, they’re,” I waved my hand in the air, as though I could skate by the fact that I had no real idea what had been done to those people. “And I imagine some of them were put in this penitentiary for a good reason.”

“We can talk about this later,” said Amaryllis. “We need to get moving, which means that we need to get a consensus, fast.”

“The associates are of no use to me scattered,” said Fallatehr.

“They would be freed to pursue your goals,” said Amaryllis. “If that’s not enough, you could arrange to meet with them once your obligation to us is complete.”

“I’ll take three with me, plus another who is not an associate,” said Fallatehr. “I will, naturally, never be put in a situation where I might be pressganged.”

“Not an associate?” asked Amaryllis with narrowed eyes.

“Nonanima,” said Fallatehr. The name wasn’t familiar to me, but I heard an intake of breath from Fenn. “She is already in chains.” Well that’s fucking ominous.

“You, two associates, and the nonanima,” said Amaryllis.

“And, of course, passage for all my associates,” said Fallatehr.

Amaryllis nodded, but she didn’t seem particularly happy about it. I had no idea what the bounds of soul magic actually were, and didn’t fully understand what these associates were to him. They weren’t clones, exactly, but they were at the very least people whose souls had been remade in the image of his own. There was too much uncertainty though, and the fact that he could lie to us with practical impunity was worrying.

Fallatehr left to go speak with his associates. I didn’t know how much time we had left until the curfew, but it sure as hell felt like he was being nonchalant about things. We were just out of range of being able to hear his conversation, which was done with low voices and occasional glances in our direction.
“Do you have some clever plan?” I asked Amaryllis. “Something that you’re not telling me because of the n-word, or --”

“No,” said Amaryllis. “I intend to hold up our end of the bargain.”

“Fuck,” said Fenn. “I’m not on board with that.”

“Seems dicey, if anyone finds out that it was us, and they’ll have our names,” I said.

“Yes,” said Amaryllis. “It gives us an incentive not to defect against him, it’s implicitly part of the deal.”

That made sense, but I really didn’t like it. We were essentially giving him blackmail ammunition. Of course, we were already enemies of the state, which meant that the blackmail wasn’t as useful as it might seem on first blush, and that was probably also part of Amaryllis’ negotiation strategy, which was, apparently, more layered than I gave her credit for. It also put us in a collective corner, which she’d done without consulting us. Hard to do, in the heat of the moment, but it still rubbed me the wrong way.

“Scenario?” asked Amaryllis.

“Scenario zero,” I replied. No new quests, no quest updates, no achievements, no companion messages. I had thought that Fallatehr would prove to be a companion, but if he was, the game hadn’t seen fit to say anything about him yet. I’d thought that the prison would hold some kind of companion, because this seemed like the perfect place for the ‘you find a locked up guy with skills who joins your party’ trope to rear its head.

“You’re not going to talk her out of this?” asked Fenn.

“No,” I replied. I looked her over. She was still standing with her arms crossed. “Be on the lookout while we move, they have every incentive to try to whittle down our numbers or attack us in the confusion of battle. It could be Fireteam Blackheart all over again.”

Fenn twisted her lips to the side for a moment, then nodded. I wasn’t sure that she had caught the message that I was trying to pass across; when Fenn and I had been stuck with Fireteam Blackheart, before we’d really known each other, whittling down the fireteam while ostensibly moving toward our goals had been the best plan of action we’d had available to us, because there was no way that we were going to be left alive. Fallatehr and his people had incentives to weaken us so we’d be easier to handle, but we had those same incentives.

I glanced toward Amaryllis after a short grace period, wanting to see whether she would pick up what I was saying but not wanting to look over eager, like I was getting away with something. She was, mercifully, staring at Fallatehr and his associates. I tracked her intent gaze to where a cage was being drawn out from under a table. A pale woman with white hair was inside it, and two of the scarred elves opened the door to pull her out.

“Nonanima?” I asked.

Amaryllis nodded. She looked my in direction with cold eyes. “If any of them happen to die on our way out, it would be best if she was one of them.”
We moved through the prison together, with our party of four at the front. Fallatehr walked in the midst of his quote associates unquote, who formed a tight ring around him. Behind him, the nonanima was being pulled along by the brass manacles around her wrists and the collar wrapping her throat.

My eyes kept going to her whenever I looked behind me. She walked with a downcast stare, her scarlet eyes fixed on the ground three feet in front of her. Unlike most of the others, she was in dingy clothing, but she was still pretty for all that, with delicate, gracile features. Her white hair, pale skin, and red eyes were obviously (to me) meant to call to mind an albino, but I knew what actual albinos looked like, and she wasn’t quite that.

“So what’s a nonanima?” I had asked Amaryllis.

“She doesn’t have a soul,” Amaryllis had answered, while looking the woman over. “They’re prone to demonic possession; without a soul, it’s easy to enter the body. She won’t have any magic that ties to the soul, which means most of them.”

“We’re talking about demonic possession here?” I’d asked. Demons, and the hells in general, were not one of the areas that I’d done a deep dive on; *Portrait of the Many Hells* was one of those books that I’d mostly gotten in case I needed it, rather than because I thought it was important background information that I needed to get to as quickly as possible, not that (from the index) *Portrait* went into much detail on demons or devils.

“It’s short-term, hours at most, maybe longer if they chained it, but they’re bad at coordination. If possessed, she’ll only have the strength of a human,” Amaryllis had replied. “The kinds of devils that can reach up to puppet her won’t be clever enough to be convincing, and if Fallatehr is smart, he’ll have his people punch her in the mouth if she tries to convince anyone. I don’t think she’s a threat.”

“The real question is why he has her,” Fenn had said.

“He’s a soul mage,” Amaryllis had replied. “The interest is obvious. Where he got her from is more concerning.” She’d pursed her lips. “It’s possible that he made her.”

I’d had a lot of questions, as was typical for me, but the operational briefing of ‘she can be possessed by demons or devils pretty much at will and can’t do magic’ was clear enough for the time being. The whole conversation about some people not having souls was going to have to wait, even though it raised a lot of questions about what, exactly, a soul actually did for you. I might have considered myself lucky to have recently acquired an apprenticeship to a master soul mage, if I liked or trusted the soul mage in question.

So we had moved from the gymnasium, down the hallways of the penitentiary, trying to make as direct a path outside as possible, keeping to a formation that would nearly guarantee that our party would take the brunt of any counter-attack by whatever Amoureux Penitentiary could muster against us. I didn’t really consider that fair, but Amaryllis didn’t seem to want to press the matter, and I deferred to her judgement. It certainly made more tactical sense, if you valued all of us equally, but I wanted some cannon fodder between myself and whatever trouble was ahead (and I was thankful that the game didn’t slap a penalty on me for that thought).

“Kran di in negidor gre ha deheki,” said Grak as he walked beside me, keeping his voice low. Literally translated, that meant ‘I him the gate about disbelieve’, except that ‘negid(or)’ didn’t just
mean gate, it meant a ward, and in context, he was referring to Fallatehr telling us that the prison would block teleportation, I was pretty sure.

I glanced back at the people following us, for what seemed like the fifth time. “Lir Groglir lonele lalile?” I asked. Do we need to be speaking Groglir?

“Lir okr dril na mo lahon dadon o,” replied Grak. And he was right, we had been putting in the work for a reason. Being able to speak in confidence was, certainly, one of those reasons, and given the complexity of Groglir, and the fact that it was the trade language of dwarves, it was really unlikely that anyone could listen in on us -- that, plus the fact that Grak was speaking softly.

“Na lir lonele lonele di gre?” I asked, which I was fairly sure was a butchering of Groglir, meant to ask whether there was anything actionable we could do about the fact that we were taking Fallatehr’s word on teleportation not working.

That had more or less been my conclusion. If you couldn’t teleport within the penitentiary, then the only way to test that was to attempt to teleport, which we couldn’t do because of the risk that it was successful. At best, we might have been able to convince Fallatehr to be part of the test, leaving all his associates behind, but it would be hard to do that now, after terms had been negotiated. I wished that Grak had said something earlier, but maybe it hadn’t occurred to him, or maybe he was still second-guessing himself after our encounter with the suits of armor. My command of Groglir wasn’t good enough that I wanted to pursue that conversation.

So all that Grak had really done was to heighten my anxiety, not just about our teleportation being blocked, but about everything that Fallatehr had said to us. Thanks, Grak.

I was already in high gear when the golems appeared. Whatever internal changes the penitentiary had been going through in response to our arrival, there was a clear difference in the golems; they were wearing armor now, thick, crude slabs of wood on top of the packed earth of their torsos. There were fewer of them than last time, but more of the dangerous ones, and I was pretty confident that the addition of even something as weak as wooden armor was going to mean that I couldn’t kill one of the big guys by myself.

Nevertheless, I ran toward them with my sword drawn, with Amaryllis close behind me.

By the time we reached them, the casters had done something to make the air oppressively hot. Burning leaves swirled through the air, flashing bright enough to leave a spot on my vision where they landed. The golems didn’t seem to mind at all; small embers were gradually accumulating on them. It was a complication that I really didn’t want, but there was nothing to be done about it, so I burned SPD from one of my bones and sliced off the arm of a brute, then kicked it over to dodge away from a fist that was slamming down like a windmill.

I’d felt the excitement building from the moment we’d seen them, and it had built up to fever pitch by the time I actually met with them. I was gradually learning to simply lose myself in combat, to experience the zen of trusting in my skills. It became more of a sequence of decisions than anything else, each one thought about for relatively little time, especially on a battlefield like this one where burning motes threatened to incinerate part of my armor or dig into my skin, or whatever they were going to do.

Fallatehr’s associates came to join us, wielding the weapons that we’d given them to use. They had nothing magical, but there were more than enough mundane weapons stored away in Fenn’s glove. We hadn’t had a discussion about arming people who might be the enemy, but it seemed to me to be
a building block of trust, in the same way that the way they joined us in battle was another building block. Naturally, there are different reasons to build trust, and one of them was so you could betray that trust later on; I wasn’t blind to that, because that was my current plan with Fallatehr.

I fought alongside Fallatehr’s people, which mostly consisted of them baiting out strikes and me moving in with superior agility and strength to land a hit that actually did some damage. The golems seemed to understand that I was the real threat, since they went after me more than anyone else, but they couldn’t flatly ignore the damage that was being done to them by the elves.

This was my first time seeing elves actually fight, and I wasn’t all that impressed, given their reputation. I could see the elf luck in action, as they slipped beneath a crushing fist or leapt back from a blow that they couldn’t see, and certainly they moved with an unearthly grace and agility that didn’t seem like it could possibly be a product of their muscles, but I didn’t think that I was all that far behind them in terms of dexterity. When using bone magic to speed, they were practically slow. And even without blood magic, I still had a clear power advantage, though I was, at this point, pretty powerfully built.

I was gauging their abilities because I was thinking about what Fenn had said -- I agreed with her, that we’d prefer as many of them to die as possible, and I’d also agreed that it would make sense for them to try the same against us. I wasn’t just fighting against the golems, I was watching the men and women fighting alongside us, trying not to expose myself too much to them.

I watched one of them get clipped in the head by one of the large, armored golems, but the elven woman only slid along the ground without crumpling up as I’d thought she would. I realized what had happened a moment later, when a quick glance around showed the grey vlere-gur clutching a bleeding head-wound, far from the action. All of Fallatehr’s people were probably linked through the soul, so that wounds would end up on the person most able to take them. That was going to make any fight we had with them extremely problematic.

And it might have been because I was keeping a close eye on what everyone else around me was doing that I allowed one of the floating, burning bits of leaf to touch me. It landed on my armored collarbone, where it ignited with a blinding flash, and while I was blinking that away and trying to move to safety, I was hit by the golem, right in the chest. I went flying backward through the air and skidded to a stop on the tiled floor, gasping in pain and nearly blind.

Grak was on me in an instant, slapping down at the places where I was on fire; I had hit a few of the motes of fire on my way through the air. As I slowly came to my senses and my vision returned to me, I saw Fallatehr standing with six of his associates around him, out of the fight, which he was watching with interest. His nonanima stood behind him, chained and held in place, but I could see that she too was watching.

I healed myself as quickly as I could. I had broken ribs and punctured my lungs, but I wasn’t so far gone that I couldn’t reach a shaky hand to my bandolier and touch one of the bones. After the first wave of healing, it was easy to administer the second, and the third, until Fenn was beside me, feeding me more bones and waving bone-smoke from the air. It was painful, certainly, but my chest was almost as numb as my hand was, and whatever internal injuries I had sustained, I wasn’t feeling anywhere near the full brunt of them.

As soon as I was able, I raced back into the fight. I passed the vlere-gur, who was dead on the ground, and saw one of the elves fly to the side of the hallway from some unseen hit she’d taken through a soul link. Amaryllis was all by herself, separated from both me and Fallatehr’s people, but the casters at the back seemed to be dead, with the ground around them littered with the effects of their spells: pink petals, thin bits of vines, and a handful of rocks that floated a few inches above the
Two of the four brutes had been killed, with the majority of the work having been done with my blade. A third had its wooden armor on fire, and was being slowly taken down by the elves, who were flensing away at it with their borrowed swords. That left one for Amaryllis and I. We came together, each taking a different side of it, and I sliced halfway through its crude arm at the shoulder while she went in close and began flickering her blade. Even with my strongest hits, I wasn’t getting through the armor, but I could at least disarm him so that Amaryllis could do her work. Once I’d dodged another attack and chopped clean through his other arm, I began to attack him from the side, seeking the gaps in his armor, but it was hard to bring as much power to a precise hit. The golem died from a thousand cuts, spilling goop out from the hundreds of holes Amaryllis had put through its armor and into its interior, and eventually it collapsed down to the ground.

We kept moving as they talked, with the conversation carried out over the rustling of clothes and the echoing sound of our footfalls. Each step of the seven-foot-tall woman was almost thunderously loud, and she was breathing heavily, putting by far the most effort into moving quickly. She hadn’t
came into battle with us, though I wasn’t quite sure why; she was powerfully built, and I was getting a real ‘death by snu snu’ vibe from her.

“It was once common practice to carve out the skills of the imprisoned,” said Fallatehr. “I have not built these men and women up to be fighters, though some of them were, in their past lives. It’s as though they’ve never held a blade before.”

“Unfortunate,” said Amaryllis. I wondered whether she was thinking what I was thinking, which is that Fallatehr was probably feeding us a line of bullshit.

It wasn’t entirely clear what exact alterations Fallatehr had made to these people, except that he’d done something to their souls to make them relatively obedient and willing to listen to his orders, if (it was implied) imperfectly, and also to use them to cloak his own identity from the penitentiary. Even given his limited supply of bodies, I didn’t believe that he had completely neglected turning one of them into a knife. If he hadn’t trained (or forged) them all into soul mages, what was the point in making them into his servants? The gambit would be simple enough; throw a few bodies away in the first fight to convince us that he had no one who would be that much of a threat, and save the rest for a strike when we least expected it. It was what I might have done.

They didn’t turn on us as we moved through the halls, retracing our steps back to the entrance, past a few of the battles we’d fought, and the other threat, the prison itself, didn’t seem to have any other surprises ready to ambush us with, at least not before we got outside. We finally found ourselves in the entryway where we’d fought the brass suits of armor, which were still laying on the ground right where we’d left them, along with a fair amount of our own blood. It had grown dark as we’d made our way through the penitentiary, and now the only light was from my hand, which I channeled blood magic through to act as a torch.

“It’s probably waiting for us on the other side,” said Amaryllis. “It hasn’t had that much time to set anything up.”

“Don’t underestimate this place,” said Fallatehr. With a gesture from him, his associates fanned out and moved forward. One of them left him holding the chain that bound the nonanima. “It was weak while it slept, but now it has awakened.” He stepped toward one of the people in front of him, who flinched back.

“What are you doing?” asked the elf, watching Fallatehr with wary eyes.

Fallatehr looked at the other elf, head cocked to the side. “I will turn you back, if we both survive. You know that oblivion awaits you without me.”

The elf hesitated, then straightened slightly and bowed his head. Fallatehr moved forward and touched him on the brow, pushing with an elegant thumb. The elf stepped back, gasping slightly, and Fallatehr moved on to the next, continuing on down the line until only two were left, one of them the large woman, the other the shirtless elf we’d met in the visitation room. Two associates would travel with us, that was the agreement.

“Heal them, Juniper,” said Fallatehr, gesturing to the people he had touched.

I looked at him. “They’re not injured.” I was taking the conversational bait, for his sake. I was smart enough to know where he was going with this.

“Injury is a matter of how the soul views the body,” said Fallatehr with a triumphant, sharp-toothed grin. “I think you will find that they are quite injured.”
I swallowed hard and touched the first of them. I was pretty sure that it wasn’t a trap, but even though it wasn’t, I was getting a bad feeling about this. The elf was no longer himself, visibly so; he had shown a wariness before Fallatehr had touched him, but now there was nothing but a cow-like submission and a faint dullness to his eyes. He didn’t react to my touch in the slightest.

I did a slow, steady pull from the bone to get as much from it as I could, and I had to resist the urge to yank my hand away when I saw his jaw dislocate itself. Eventually I closed my eyes as I burned through bones, but that wasn’t any better, because then I was listening to the creaks and groans of his body. So I opened my eyes and tried not to pay too much attention. It took ten bones, drained with full efficiency, until he stopped changing. I looked on the creation in horror.

Aerbian elves were carnivores, hunters, that much had been made clear to me, but they were still humanoid. They were upright tool users, not beasts, and killers, but still refined and restrained. The thing that Fallatehr had turned this elf into, with my help, was more gracile but less human, and as soon as my hand pulled away, it dropped to all fours, in a position it was clearly comfortable in. The arms had been elongated and the wrists had been adapted, the better for the creature to swipe with its claws. But as I looked, I saw that it didn’t actually have claws, it had sharpened bones protruding from its last knuckle, with the fingernail resting just on top of it. There were other changes, most of them to get the creature into a less humanoid shape, but I quickly moved on before getting engrossed in the appearance of the thing.

“Not the best weapon we might have, given the circumstances,” said Fallatehr, “But I had always assumed that if it came to a fight I would be facing people, not the prison itself, so this is what I had prepared.”

“What are they?” asked Fenn with a shaky voice.

“Elves,” said Fallatehr with a laugh that no one shared. “I stripped out everything I didn’t think was necessary and used it to rebuild them into something ferocious. It used to be common, in the glory days of the Second Empire. They are death incarnate, though of course, better suited to fighting against people.” I wasn’t sure whether I was imagining a threat there.

I moved down the line, “healing” each of them in turn and trying my best not to have my stomach churned by what I was doing.

“I take it these are not the things you wish to learn from me, Juniper?” asked Fallatehr.

“I’ll learn them, if you’re willing to teach,” I said as I transformed another one into a monster. I tried to rationalize it; I wasn’t the one that had actually changed them, they had been changed at the level of their very soul by Fallatehr, I was just expressing that change. And it hadn’t been like they were full people before -- though they had been people enough to fear what Fallatehr was going to do to them.

“They’ve been giving us time,” said Amaryllis with her eyes on the door. “I’m not sure that we’re getting the better end of the deal here.”

“We only need to leave the penitentiary,” said Fallatehr. “The pelehr will provide a distraction, if nothing else, so that we might find a way through.”

After I had changed over the last of them, they turned and lined up in front of the door. Fallatehr didn’t seem at all perturbed by the idea of what we might find out there, waiting between us and the front gate. I could already feel my pulse starting to pick up, because this was the final battle, and that was when things always got hairy.
We opened the door to see two of the twenty-foot tall brass creatures with their hammers held in a firm grip, lit by the glow of Celestar and the multi-colored stars that hung above Aerb. Four of the gorilla-like brutes stood beneath them, each of them with brass armor rather than wood, an unfortunate development. The gargoyles were still broken though, which was the only good news, or rather, the only absence of bad news. The gate golem still blocked the main entryway, which we’d been hoping to leave out of. As fights went, it didn’t look particularly winnable.

The single saving grace was that they weren’t attacking just yet, and the reason for that was simple; they had sent an envoy. It was a far cry from the dirt golem that we’d first met, the one that spoke to us with its too-human mouth. Instead, it was a thing of dark glass and brass, with a few places where it had strips of dark wood. Its mouth was still a normal mouth though, with lips and teeth that seemed out of place on its form.

“Please,” it said. “There is still time to resolve this with peace.”

“How would we do that?” asked Amaryllis.

“Lay down your arms and surrender,” said the mouthpiece of the prison. “You will die with surety otherwise.”

I could hear the sound of the pelehr breathing loudly. Whatever had been done to their lungs and mouth, Fallatehr hadn’t been optimizing for silence. It gave an unnerving backdrop to the conversation. I didn’t think that giving in to the prison was an option, but the fight didn’t seem to be an option either, especially since it would be the perfect, final opportunity to stab us in the back before we had him on the back foot.

I wasn’t about to back down at this point and throw away the grind we’d gone through in getting through this dungeon, but I also stared at the giant brass creatures and didn’t see a way for us to beat them. No, that was the wrong way of thinking, that was my problem, this wasn’t a fight to destroy the enemy, we didn’t actually care about the prison except that it was an impediment to our goals. All we really needed to do was to get on the other side of the wall, where, presumably, the teleportation key would still work. Fallatehr had said it himself, we only needed to leave the penitentiary.

I moved close to Amaryllis. “Stall,” I whispered to her, hoping that she’d be able to hear me clearly through her helmet. I moved on to Fallatehr as she started talking to the golem, using polite, meaningless, diplomatic language like she’d been prepared to do that all along.

“The prison thinks that you’re all one person?” I asked him.

He raised an eyebrow, which arched perfectly. “No,” he replied. He gestured to the pelehr. “They are no longer in my image.”

“Do you fear this fight?” I asked. In the background, the golem was answering Amaryllis’ long monologue.

“I’ve stripped fear from myself, as much as was possible,” answered Fallatehr. “I do not believe our outcomes are likely to be good. Most likely you will die and I will remain imprisoned with fewer resources than I had when you arrived.”

“I have a plan, but it’s going to require trust,” I said. “We’re going to stuff you inside the glove.”

Fallatehr frowned. “With an associate left outside to cloak my position? Yes, it might work. There are still a few, less valuable ones left behind in strategic locations.” (I had guessed that, just based on...
the discrepancy in the numbers that I’d been given: twenty associates, but only fifteen people in the gymnasium.)

I moved away from him and made sure that Amaryllis was still engaged with the golem. She appeared to be talking at length about the morality of imprisonment for crimes which were committed prior to the criminal act becoming illegal. That seemed to at least be holding its attention. I had no idea how well it could hear, or whether it was even cognitively capable of acting on that information if it could, but so far it wasn’t making a move against us.

“Fenn, you remember riding the rocket?” I asked as I stepped up beside her.

“I remember it not going so great,” she said. “Actually, I remember it getting so fucked that you were racing across the desert and burning through your bones, which is what got us in this particular mess in the first place. Besides that, we don’t have a rocket.”

“You’ve got the sand bow,” I said. I glanced at the wall, which stood thirty feet high and at least a football field’s length away from us. The shot would be simplicity itself for someone as skilled as Fenn.

“You’re nuts,” she said, but she gave me a grin. Her eyes quickly scanned the top of the wall, and I looked with her, to the places where she’d removed the gargoyles. We already knew, from the birds that Solace had sent over, that the laser gargoyles had been the primary means of keeping things from going over the wall. “Not enough masks though, and however great Mary is, I doubt that she can keep it up for long enough that we can make more.” We had made more of them during our week off in the bottle, so that we had five on hand, enough to cover the whole party, but assuming that we still needed to keep up our end of the bargain, that wasn’t enough.

I moved back over to Fallatehr. “We have to leave them behind,” I said, gesturing at the pelehr. “Non-negotiable.”

“Convenient for you,” said Fallatehr, watching me closely. I agreed with him, it was very convenient for me, but that didn’t make it any less true. Bad enough that we’d be taking him and three others, nearly even numbers except that the nonanima didn’t count, but not releasing more of Fallatehr onto the world was a plus in my book, given what he could do. “Very well.”

“Wait ten minutes before you try to get out, we’ll pull you if it’s clear,” I said. I wondered whether he would think it was a trap, because that’s what I would have thought, but I was apparently bad enough at lying that it was an asset to me, because he nodded along.

Fenn surprised me by stepping forward and handing him a breathing kit from her glove. I hadn’t even heard her sneak up next to me. He took it for a moment with a mild questioning look, but he put it on all the same. Fenn touched him on the arm with her gloved hand, and I stepped over to Amaryllis, trying not to think about the fact that they were touching, or worry too much about whether that was giving him access to her soul, or what he might be able to do in ten seconds time. Ten seconds got you nothing, according to everything that we knew about soul magic, but he had been pursuing his own research here for hundreds of years. It was a disquieting thought.

“Might be trouble in five seconds,” I said. I wasn’t sure how the prison would react to Fallatehr -- though one of many, from its perspective -- disappearing.

“I think I might be getting somewhere,” said Amaryllis.

I glanced back at Fallatehr, just in time to see him disappear into the glove. I began transforming my sword from ring into two-hander, but stopped when I looked back at the golem, which hadn’t reacted
at all. *Holy crap, this might actually work.*

We put the others into the glove, one by one, first Grak, then the tall woman, then the elf with strips taken out of his scarwork that we’d first met in the visitation room. That left only Amaryllis, Fenn, the nonanima, and the peleh, who we weren’t going to be taking with us. I wasn’t sure what kind of standing orders they had from Fallatehr, if he had control over them at all, but they weren’t moving yet, so I counted my blessings.

“Okay,” I said to the nonanima, looking her in her red eyes. They were glassy and unfocused, not actually looking at me even though I was right in front of her. I held the last breathing kit in my hand, with its thick rubber hose and connected tank. “I’m going to put this on you, I need you to not make a move until you’ve counted to five minutes.”

“Fallatehr was willing to leave her,” said Fenn. She held her hand out to the side and the void rifle appeared in it. I moved in front of the nonanima as she raised it. “Joon,” she sighed. “We have minutes, she could be possessed right now.”

“She’s innocent,” I said.

“Shit,” Fenn swore. “She’s fucking Joon-bait.” But whatever her objections, the void rifle disappeared back into her glove. She took out the sand bow, then took out a type of arrow that I had never seen before, one with a thick metal center. She unscrewed the fletching from the shaft and poked a finger down it. “You know,” she said as she stripped off the glove and began rolling it up, “The nonanima isn’t a clue, she’s a threat.” She stuck the glove into the arrow’s tube, then screwed it shut. “Really hoping that weight isn’t going to be too much of a factor, but the glove is light enough, and luck is on our side.” She prodded at a small bit of glove sticking out. “Put her in the glove, then let’s make haste.”

The nonanima hadn’t said anything to me, and when I put the mask on her, leaving her chains and collar in place, she accepted it without complaint. Fenn put her into the glove without further comment.

“So, my pretty companion, how goes the jabbering?” asked Fenn, clasping Amaryllis on the shoulder. Amaryllis stopped in mid-sentence; she had been saying something about the legal structure of Anglecynn and where the Amoureux Penitentiary fell in that scheme.

“Ready,” said Amaryllis, touching the glove.

“What is the meaning of this?” asked the golem, looking between the three of us. Whatever rhetorical spell Amaryllis had wrapped it in, that had broken, but we still weren’t being attacked.

Amaryllis disappeared into the glove, then Fenn held it out to me. I hesitated.

“I can make it over the wall on my own,” I said, looking down at the arrow. “Burning bones, I can do it.”

“Oh fuck off,” said Fenn.

“I will not allow you to leave,” said the golem. “You have committed crimes against me which must be answered for, illegalities which --”

“I can make it over the wall, I can burn through bones, I have Ropey with me, and the Anyblade, and if something goes wrong with the arrow, if the shot is off, if it’s intercepted, then someone should --”
“All points you could have raised earlier,” said Fenn with a scowl. She drew back her bow and fired the arrow at full draw, which stuck in the air a foot from the end of the bow. She walked forward and touched the small bit of black that stuck out from it. “I’m going to trust you, and we’re going to have words after this is over. You promised me that you didn’t have a deathwish.”

“I don’t,” I said, keeping my eyes on the arrow hanging in the air. Fenn vanished shortly afterward. I kept watching the arrow and counting down, occasionally looking at the armored golems and the twenty-foot tall brass statues with their enormous hammers. The thing I was most worried about was one of the brass colossi doing a giant basketball-player jump up into the air to slam the arrow back down, or maybe just rushing forward to intercept its arc. They still weren’t moving though, and with every second I began to relax a little bit, except for the fact that I still had to run past all that garbage. And if the arrow plan went off without a hitch, then I’d look pretty stupid.

(I was trying to stop myself from thinking about the Unspoken Plan Guarantee, which was the real reason that I was standing watch and putting myself in danger. I hated that meta-level reasoning, and halfway wished I could abolish it from my mind. But the last time we’d tried a similar plan, things had gone wrong, and I didn’t know whether it was down to narrative or not, to the whims of the Dungeon Master trying to make things interesting. I was hoping that I was forcing the game into a particular position, but trying my best not to think about it, because if it was only meta-level thinking, I was pretty sure that the Dungeon Master wouldn’t respond well to it.

I wasn’t sure that having me stand guard and act as a backup strategy made sense by itself, without the meta considerations, but it was too hard to evaluate the situation on the fly and try to strip out a layer of information and processing that I knew was there. In a hypothetical world where I didn’t know that I was in a game, would I have acted the same way? Would I have declared myself the party member most capable of making the run, the best option in case the arrow and glove didn’t make it and had to be manually tossed over? Or would I have just let Fenn touch that corner of the glove to me? I honestly had no idea.)

Twenty-five mississippi, twenty-six mississippi --

The nonanima appeared beside the arrow, still with a dull look in her eyes, with her hands in manacles in front of her and the collar around her neck, and the mask I’d put in place. She looked at me for just a moment, then I watched the arrow zip off through the air at Fenn’s full draw, sailing high over the wall and disappearing from sight.

“Something has gone wrong,” said the golem. I saw the enormous brass colossuses start to move. “Cease what you are doing.”

“Okay,” I said to the nonanima. “I’ll get you out of here.”

“No,” said the golem, “Cease.”

I reached forward, cautious of frightening her, and began to pick her locks with the Anyblade.

“What are you doing?” she asked. Her voice was soft and her red eyes were wide. The sound was slightly muffled by the mask, which I removed once the manacles were off. She gently touched her wrist. Up until this point, I wasn’t actually sure that she could talk.

“I’m taking you out of here,” I said. A gentleman should ask, but we didn’t have time for that, so I picked her up and threw her over my shoulder in a fireman’s carry and took off toward the wall.

Now this, this was legitimately stupid, and even as I’d recognized that, I knew that I was going to do it anyway. I’d been preparing for different scenarios, trying to plot out how best to weave a path
through the various enemies, trying to figure out where the arrow would land, if it went off course or was stopped in flight where it would land, how I would get to it … and this was a complication that would lower my chances of surviving the next few minutes. I’d be better off leaving her to fend for herself among the pelehr at the prison systems, and she’d be obliterated one way or another.

But no, I ran with her over my shoulder, grateful that she wasn’t struggling against me. I’d thought that it wouldn’t be too hard for me to clear the wall; it was thirty feet tall, I was about six feet tall, plus another two feet for my arms, which meant that I needed a vertical jump of maybe twenty-two feet. The highest vertical jump on record was something like four feet -- information that I knew I didn’t know off-hand, which must have been injected into my brain by high KNO -- but I had bone and blood magic in combination. Back at Barren Jewel I’d been able to launch both Fenn and Amaryllis high enough that they could reach the top of a twenty-foot wall, and I’d been much weaker back then.

And if that failed, the plan was to use Ropey to get a way over, no grappling hook needed, and if that somehow didn’t work, then I’d lure one of the big guys over to smash in the wall and give me an out, and if that didn’t work, then I could probably make something happen with the Anyblade, either using a poleaxe as a ladder or wedging it into the wall. If all those failed, then I was pretty confident that I could think of something; it wasn’t too much of a guess to say that the enemy had high Endurance and Power but low Speed, which meant that all I really had to do was keep running and not get penned in.

The problem was, none of those plans assumed that I would be carrying a hundred pounds of weight that also needed to get over (or through) the wall, and she was definitely slowing me down. The gorilla golems were stomping toward me as I took my run for the wall, and the brass colossi were stomping along, hammers raised. My dead hand groped for a bone in my bandolier, and I drew in SPD from it, then dodged between two of the large golems, narrowly avoiding a powerful hit that sailed above my head. I was right though, the golems were slow and easy to dodge, and assuming that their base form hadn’t been upgraded too much, a single hit from them still wouldn’t be enough to kill me, so long as it landed on my armor.

I liked speed. I liked being faster, being able to outrun people, not having to worry about hits because I’d be gone by the time the hit reached me. The girl on my shoulder was slowing me down, but I was proficient enough with blood magic to put the pulse of my blood in every step, and combined with the extra speed from the bone, avoiding their attacks was nearly trivial.

“You’re going to have to lock your legs when I throw you!” I yelled to her, hoping that she was together enough to understand me. “Catch the lip of the wall!”

I skidded to a stop at the wall and glanced behind us to see how much time we had. I was momentarily thrilled to see that the golems were concerning themselves with the pelehr, which had taken it upon themselves to provide a distraction (or more likely, been commanded to). That relief turned sour when I saw one of them die; they had been people, imprisoned here, then with their essence manipulated by Fallatehr for decades or longer until they were simply thrown away, meat for the grinder. And one of the two colossuses was still coming for us.

“Lock your legs,” I said and I started to lift the girl up. I thought about it for a bit and reached down to pull up a bone to put it in my mouth, which had a nauseatingly gamey taste. “I ‘oin’ a’ ‘row oo up ‘ere.”

She looked up at the top of the wall, then down at me, and I felt her legs go straight. She didn’t seem very strong, but I was hoping that she could take the force of it and not just crumple. “Un, ‘wo, ‘ree,” I said, and launched her as high in the air as I could, using every ounce of power from bone and
blood. She went higher than I had expected, and landed right on the top of the wall with her legs sticking out, barely visible in the dark now that I’d let my light go out.

“Stay there!” I called to her. A glance back at the colossus showed I had maybe a second. I fished Ropey out from my bag and spun him around once before tossing him up; he landed on her legs and slithered over her. I hoped that he would get the message about helping her down, but Ropey had always been dependable.

I rolled to the side to avoid the strike of the colossus bringing its hammer down; it was faster than I had hoped it would be, but now I wasn’t carrying anything. I spared a glance toward my supply of blood, which had finally dipped down below the halfway point, which was the normal carrying capacity of my body. I’d blown through the surplus, one bounding step or swing of the sword at a time, that and the few hits I’d taken. I watched the colossus carefully as it moved, the weight behind how it lifted the monstrously large hammer, the wind-up before it took another swing. I dodged that one too, with minimal effort on my part.

The pelehr were dying one-by-one, skulls crushed in or legs stomped down, but I couldn’t bring myself to feel bad about them, and the battlefield wasn’t the place to be actively trying to make yourself feel emotions about people you’d just met. In a stark, split-second moment, I realized that’s what I was trying to do, and I could see the chain of thought that was trying to form in my mind, where I would rush in to save them, and be forced into killing the golems, and surely that would get me closer to leveling up. The colossus swung his hammer down and I had to expend more effort in moving out of the way with a well-timed Sanguine Surge, because I wasn’t paying the full amount of attention to the fight.

I did a ducking roll through his legs, coming up behind his back. I struck his ankle once with the Anyblade in its largest form, but barely even left a dent in the brass. I needed to get over the wall, that was all I needed to do to win, yet here I was, moving closer to the action, where the second colossus had swept aside one of the pelehr. He began moving toward me as his counterpart, the one I’d ducked past, began turning around.

I ran, just to give myself time to think. It seemed too easy to go over the wall, like I’d be punished for it by the game, but was I just thinking that because I was worried that I was depriving myself of a level up by leaving these slow, lumbering sources of xp behind? I didn’t know whether I could actually trust myself to be rational. I heard a sound and looked up in time to see a gargoyle opening its mouth toward me. I moved the Anyblade up, as a shortsword, and parried the green laser that the gargoyle fired my way.

I turned and ran back the other way. The only reason that the gargoyle was in play was that I’d gone too far, away from the ones that Fenn had knocked down. I could see bloodied, broken corpses laying on the ground by the golems, all of which were heading my way. They had a few chunks taken out of them, along with marks on the brass, some of them sharp, but their lives had been spent on buying me time. Maybe Fallatehr had set them up for that when he’d changed them. All I could think about when I looked at the enemies was that it was all such a waste, and I couldn’t even tell which part of my brain was thinking that.

I charged toward the wall and jumped up it, bone and blood propelling me higher than anyone back on Earth had ever jumped before. It wasn’t enough, but I extended the Anyblade into a polearm with a hook, which, fully extended caught the edge of the wall. I hit the wall, scraping my face, then began to climb, hand over hand, up the length of the polearm. When I reached the top, I reformed the Anyblade into a ring and took a last look at the penitentiary. It was spectacular under the light of Celestar and the multicolored stars.
One of the brass colossi reared back and threw his hammer at me, end over end, which I really hadn’t expected. I dropped down the other side of the wall, grabbing the edge with my hands as I fell, and watched the brass hammer go sailing by above me. It was twenty feet to the ground from where I was, but I dropped it anyway, pushing off the wall at the last second and then going for a roll once I hit the ground to shed my momentum. Rolling was none too fun in armor, as I’d already learned, but I still had three bones to spare.

*Quest Completed: Crimes Against the Soul - You have retrieved Fallatehr Whiteshell from within the Amoureux Penitentiary and are ready to embark upon your new life as his dedicated student, with a new companion to boot.*

There was no level up.

I jogged over to the nonanima, who was looking at Ropey in confusion, healing my minor scrapes along the way. It had crossed my mind that she might be a new companion, but between her, Fallatehr, and the seven-foot-tall woman, she was my third choice.

“Joon!” called Fenn, from some distance away, barely visible in the moonlight.

I waved to her. “Fenn, I made a friend!”

“Why did you save me?” the nonanima asked with her small, hushed voice.

“It seemed wrong to let you die,” I said. Actually, *I think that I might have tried to save you because I wanted to experience the ecstasy provided to me by the game we’re in, but I’m not one hundred percent sure.*

*Loyalty Increased: [Null Pointer Exception] lvl 2!*
The Chemical History of a Candle

Bumblefuck, Kansas was large enough that our high school offered exactly one computer science elective, and I had taken it the first semester of senior year. I’d just barely completed programming a wildly ambitious game of checkers in BASIC for my final project, earning me my only A for that semester (my grades had never been stellar, and senior year they took a turn for the worse for reasons that should be obvious to you at this point). The game had incredibly crude graphics, there was no AI so you had to play against someone else, and all input was done by declaring which of the numbered squares you wanted to move your checker to. It didn’t do kinging or bubblegum either. Oh, and there was no error checking of any kind, so if you entered an illegal move, the game would faithfully execute it, and then everything would get screwed up if the program didn’t barf entirely (which it sometimes did anyway, for reasons that I never figured out).

This is all by way of saying that yeah, I was pretty fucking good at programming.

Jokes aside, I at least understood what a null reference exception was; the program tries to go look up where some variable is, and finds out that there’s a null (empty) value where that variable’s address was supposed to be. That causes the program to throw a null reference exception, which the programmer either deals with somehow, or which crashes or stalls the program.

If it was a joke, I understood it, and the game thus far had a lot of really dumb little things like that (some got a small chuckle from me, others I just rolled my eyes at). If it wasn’t just a joke, or maybe even if it was a joke, then the game was exposing its machinery to me, and that could be useful. The nameless nonanima had some loyalty to me, but it seemed that her name pointed at a null value. If it wasn’t just a joke, then what other parts of her were missing, so far as the game was concerned? What would happen to her when she reached Loyalty 10 and Twinned Souls happened, given that she didn’t have a soul? Amaryllis had already said that most types of magic wouldn’t work on her, but I wanted to know the specifics of that, and why that would be the case. It seemed important, like a lever that I could use to pry apart the different layers that made up reality.

“Why is she with you and unchained?” asked Fenn as she closed the distance between us. She had her artillery bow in hand, with an arrow nocked and aimed right at Null.

“Scenario five,” I called back. New companion, but not Fallatehr.

“Goddamn it,” said Fenn. She had been moving slowly, to keep her aim, but she dropped it and moved faster to close the distance. “Watch her, Joon!”

I turned and looked to Null, who was looking at me with wide eyes. “Uh, I’m watching?”

“They can use me at any time,” said Null, hanging her head slightly. “You shouldn’t have unbound me.”

I looked over to Fenn as she came over, raising an eyebrow. “Amaryllis said that she was only as strong as a normal human. I’m pretty sure that I can take a ninety-pound girl.”

“Wow, care to tempt fate a little bit more?” asked Fenn. Her bow disappeared into her glove and a pair of handcuffs appeared just after that. She moved over to Null, who held her hands out willingly.

“Is that necessary?” I asked.

“Come on, we’re done with this place, Mary and Grak are back there holding down the fort, two on three, let’s get going,” said Fenn.
“You’re good?” I asked Null. She nodded to me, and gave me an awestruck look that immediately made me reconsider how much concern I should be showing for her. If she’d been born in this prison and locked up for her entire life, that was a recipe for her to form an overly strong attachment to me.

“Mary is pissed, by the way,” said Fenn as we moved away from the penitentiary. She pointed a thumb back toward Null without looking at her. “The woobie probably isn’t going to help matters.”

“Is woobie a colloquial expression?” I asked. I had that jarring feeling of hearing a term I thought was Earth-exclusive used on Aerb, which I still wasn’t used to. Most of the time I didn’t ask and let it roll by, but we had time, and I was more concerned about the words and concepts that I might be using wrong, instead of just the ones with parallel or convergent origin.

“Large animal,” said Fenn. “It sits in the forest crying out in pain to draw in its prey.”

“Ah,” I said. “So you wouldn’t use it as a general term for a relative innocent going through pain and suffering who you want to protect.”

“Not unless they were going to kill you,” said Fenn with a shrug. “Maybe we don’t do the cross-cultural exchange around the soul fucker?”

“Yeah,” I said as we walked. I looked at Null again, and found her staring at me in the moonlight. I thought she would look away, but she didn’t, and eventually I had to break eye contact, which just left me with the uncomfortable feeling that she was still staring at the back of my head as we walked. “Scenario five though.”

“Yes, that’s going to make our Mary absolutely thrilled, you know her so well,” said Fenn with a snort.

We found Amaryllis and Grak both holding their weapons, while Fallatehr was sitting on the ground with a pleasant smile that didn’t reveal his sharp teeth. He had his two associates remaining, exactly as many as he’d negotiated for, the seven-foot-tall woman whose species I couldn’t determine, and the elf with strips removed from his scars we’d met at visitation.

“Did any of my pelehr survive?” asked Fallatehr.

“No,” I said. I glanced at Null. “Were you expecting them to survive?”

“I was not,” said Fallatehr. “But they were ultimately doomed, one way or another, if we weren’t going to be together. We’ll speak on it more, during your training.”

I felt a moment of discomfort at that, which I tried to suppress. Whatever he’d done to those people wasn’t the sort of thing that I wanted to learn. I would learn it, if it was on offer, and turning down another tool in the toolbox would be asinine, but I didn’t want to.

“We don’t have a safe base of operations,” said Amaryllis. “Now that the danger has passed and the key should be in working order again, I would propose that half of us leave to find lodging, while the other half stay here. After two hours, I’ll come back, and after another two hours after that, we’ll regroup. As to the groups, I was thinking that we would keep even numbers initially, four and four. I’d like Juniper and Fallatehr to go with me, that way they can take some time for initial lessons during the two hours it will take for me to return with the rest of our group. Obviously we can’t take the nonanima, that means that it will be either Retha or Lehpenn.” She gestured to the tall woman and the other elf; apparently introductions had been made in my absence.

“Scenario five,” I said to Amaryllis.
She blinked at me, then stole a brief glance at Null. “Okay,” she said. “That’s ...” She paused, then stole another glance at Null, then frowned and looked at Fallatehr. “How dangerous is she?”

“Barely at all, where the border between worlds is strong,” said Fallatehr. “How far has cosmological mapping advanced in the last few hundred years?”

“I don’t know,” said Amaryllis. “We’ll need specialty texts to figure out where it’s safe to bring her, or at the very least, better restraints, and ideally tight earmuffs.”

“What is scenario five?” asked Fallatehr.

“Nothing you need to worry about right now,” said Amaryllis. “It’s not important in the short-term, and it will take a long time to explain. We wouldn’t want to explain in front of ears that are compromised.”

“We will speak on that matter, and others, at a later time,” said Fallatehr with a calm tone and a slight nod of his head. “I would propose that Juniper and I stay here, with the nonanima and either your dwarf or half-elf.”

“Fenn,” said Fenn, pointing a finger at herself. “Grak,” she said, pointing a finger at Grak. “If it means leaving this asshole behind, I’m all for going on a trip.”

“Fenn,” said Amaryllis, in her warning voice. I was pretty sure that tension between the two of them was going to boil over no matter what steps we took to minimize it, but I wasn’t sure what form that boiling over was going to take. I was overdue for some time alone with Fenn, and one of the things I most wanted to ask her about were her thoughts on Fallatehr. “My plan is to go to Parsmont, I guess I’ll be taking Fenn, Rehta, and Lehpenn?”

I wasn’t sure that was ideal, but I didn’t have a better suggestion. It was, in some ways, like the logic puzzle about a man trying to cross the river with a bag of grain, a duck, and a fox. He could take one thing across at a time, but couldn’t leave the duck unattended with the grain (because the duck would eat the grain) and couldn’t leave the fox unattended with the duck (because the fox would eat the duck). Similarly, the overall lack of trust, and Fallatehr’s ability to fuck up someone’s soul, meant that we needed to be careful about who was left with whom.

To me, the most worrying part of what Amaryllis had proposed was that Fenn would be left alone with Rehta and Lehpenn, and I wasn’t confident that they didn’t know soul magic too. Their combat abilities were also an unknown, which meant that I wasn’t sure that Fenn would be able to fend them off if they attacked her, even with all the tricks she had up her glove, and worse, I wouldn’t necessarily be able to tell, depending on how sophisticated an attack might be. That said, I still thought that it was probably the best option available to us, even when taking into account alternate initial splits of three and five -- especially given that we needed to be building trust, rather than putting up visible signs of paranoia.

Before they left, Fallatehr touched Lehpenn and Rheta, the former on his head and the latter on the bare skin of her chest. He spent five minutes with each, wordlessly touching them with his eyes closed; I saw Amaryllis and Fenn having a hushed conversation while this was happening. For my part, I mostly spent the time with Null in my eyeline, guarding against whatever it was she might turn into.

Fenn gave me a kiss before she left, a quick, mostly chaste one, which I wasn’t entirely on board with. I didn’t want Fallatehr to know that she could be used as that sort of leverage over me, but apparently Fenn did want him to know, or maybe just thought that kissing me was worth leaking information. I resented Fallatehr a little bit, for making me want to hide our relationship.
“I’ll see you in Parsmont,” said Fenn. “Don’t do anything that I wouldn’t do.” She held out her gloved hand and dropped down a large, heavy pack of supplies, then stepped over to where Amaryllis was standing and left a few seconds later.

With that, I was alone with Fallatehr, Null, and Grak. “Grak, can you set up some wards to keep her in? I’d prefer not to rely on having to keep guard.”

“Velocity wards are the only thing that will work on her,” said Grak, as he stepped over to her and pulled out his wand. “Those are tricky to do. It will take time.”

I moved over to the supplies and began pulling a few things out, first a waterskin that I drank deeply from, then a pair of folded wooden chairs, one of which I set up for Fallatehr. After a brief grimace, I pulled some rations out from the pack of supplies and began to eat pemmican, which was a poor meal even when I was feeling hungry -- despite all the physical exertion of the day, it was still a matter of forcing the food down in small bites and trying to avoid the nausea.

“Do you wish to begin your training now?” asked Fallatehr, his eyes watching me closely in the moonlight.

“Yes,” I nodded. “I’ll understand if you don’t have a lesson plan or anything like that, but whatever you think might give me a toehold.”

“And that might be enough for you?” he asked.

“No,” I said. “The nature of my prodigy is complicated, but it’s easy for me to get the very basics of something down, if I have a place to grip the topic and time to think about it on my own. Even if I can do that for soul magic though, I would expect that I would need your tutelage in order to progress beyond those very basics.”

“Fascinating,” said Fallatehr. “I watched you fight with great interest. There are a few things that might explain you, but the simplest explanation is that you’re telling the truth. Skill with bone magic, blood magic, and extensive training with the sword, all at such a young age. How old were you again?”

“Seventeen,” I replied. I put the rest of the pemmican to the side. It felt like I had been eating for a long time, but I’d barely made a dent. A glance over at Grak showed him still working on the ward. “So what can you tell me about the soul? What is the soul?”

Fallatehr gave a pleasant, musical laugh that startled me with its suddenness. The musicality of it didn’t seem like it suited him, save for the fact that he was an elf. “We’re really starting so close to the bottom?”

“I don’t want to bring my own assumptions into this,” I said. And let’s just not mention that a lot of my assumptions come from a place called Earth.

Fallatehr tapped his finger to his lips. “There is a book about a candle, written in 97 FE, which describes it in exacting detail. Each imperfection of the candle is noted, every possible measurement of it is taken, and the composition of the candle is detailed down to the diet of the hog whose fat was rendered to make it. It runs for four hundred pages.”

“Okay,” I said slowly. “So the soul is like … a list of things about a person?”

“Some of the information listed about the candle was procedural,” said Fallatehr. “There are details of how it was created, what processes were used to render the fat, information on the construction of the molds, and all that sort of thing. The soul has nothing like it. There is nothing written upon the
soul that will tell you how a person came to be as they are, no history, only marks that you might use to work backwards and infer.”

I frowned. “Okay,” I said. “It’s a list -- a list, or unordered?”

“Unordered,” said Fallatehr, watching me.

“It’s an unordered collection of attributes that define a person,” I said. “And if that’s true, then all soul magic is really doing is rewriting those attributes.”

Fallatehr nodded. “There, as simple as that.”

“That’s it?” I asked. “That’s all the soul is? It’s … a collection of attributes?” I could see the programming metaphor right away, and it wasn’t like the game hadn’t had in-universe explanations that mirrored game mechanics, but … was the soul just another character sheet? I could already access my character sheet. I could already see the list of attributes that defined me, so far as the game was concerned. It wasn't anything new, and nothing that would help me to fix my bones.

“And if I told you that list went on for hundreds, if not thousands of pages?” asked Fallatehr. “If I told you that every form of magic interacts with those attributes in some way or another?” He didn’t seem mad that I was disrespecting his life’s work or the field of soul magic, only curious. I was pretty sure that his curiosity was the only reason we were sitting across from each other. He’d given up a fair amount for this, given that he didn’t seem to care too much about leaving the prison. He'd thrown away a dozen lives and decades of work just to watch me. I still didn't have a good handle on who he was.

“It’s just,” I started, then stopped, frowning. “I was thinking that it would be more mystical.”

“It’s not,” said Fallatehr. “I am a scientist, not a mystic. I could dress it up, but that would be to your detriment as my pupil.”

“Okay,” I said. “So how do I access my soul?”

“It would be so easy to show you, with just a touch,” said Fallatehr with a sigh.

“No,” I replied, keeping my voice firm. He’d just given me a good reminder that he was dangerous. “Tell me how I would see or feel the soul, how I would be able to make some change, without your own intervention.”

“Imagine there exists a book, written about you,” said Fallatehr. “Not a narrative, but a catalog of that which is essential to you.”

“I mean, okay,” I said with a shrug. I tried to picture that book, starting with the easy stuff, the physical measurements, the tensile strength of my hair, the volume of blood in my body, the length of my bones -- I looked down at my deformed hand. “It doesn’t necessarily match the body,” I said.

“No,” nodded Fallatehr. “The soul has its own attributes which do not always align with what the body presents.”

“Residual self-image,” I said.

“Residual?” asked Fallatehr as he looked too intently at my face.

“Nevermind,” I said. Like in The Matrix, it’s a movie from Earth you probably haven’t seen, unless that was one that Arthur cribbed from. I kept compiling the Book of Juniper, trying to figure out a
way that I could get everything into it without mentioning the past or how I was made. Not Arthur or Tiff, but the impact that they had on me, not attributes that mentioned them, but attributes that would allow you to know that they existed, if you were incredibly intelligent and could work backwards from incomplete information. “I don’t get how it’s possible,” I said. “Is memory not part of the soul?”

“It is,” said Fallatehr. “Though it’s nearly inaccessible to attempts at manipulation.”

“Then how did you change your slaves?” I asked, dropping the book metaphor from my mind for a moment. I glanced over at Grak, who had finished his ward and was eating pemmican in front of Null, his axe on his lap in front of him.

“I didn’t alter their memories,” said Fallatehr. “I altered their values to match my own, along with as many of the pathways as I could.”

“Pathways don’t sound like attributes,” I said.

“They are,” said Fallatehr. “You’ll see, when you’re further along, when you understand the feel of a soul.”

“So they’re incomplete copies,” I said. “They’re just … people with different memories from your own, who happen to share some ways of thinking.”

Fallatehr shrugged. “I never claimed that they were clones,” he said.

“And you said that they would face oblivion without you,” I said.

Fallatehr smiled, showing me his sharp teeth, in a way that I found distinctly threatening. “You’re trying to advance past your studies,” he said. “These attributes are mutable, but will revert to a coherent state, given time.”

I almost objected that that didn’t seem like oblivion to me, but then I thought about it for a bit. If I was told that I would gradually become a person who valued things that I didn’t value, who thought in ways that I didn’t think, who shared, at most, only the same memories, I might feel like that was oblivion. Actually, given that Fallatehr had altered their values, he could just make them fear the change. And then, faced with either that loss of self or becoming a monster, he had known that they would submit to becoming the pelehr.

I returned to the construction of my metaphorical book, the one that would define me down to the very last detail, so that you could clone me, if you were a better soul mage than even Fallatehr and really wanted to. Ignore memory for a moment, ignore pathways of thought (however that messy concept was pinned down), just think about everything concrete, like muscle memory, which you could do on the physical level, or values themselves, weighed and measured in dizzying arrays that wouldn’t necessarily even be coherent because people had biases, which I guessed you would have to build in too --

And that was when I felt it within my mind, like a corner of carpet had just been lifted up and I’d been made aware that the room wasn’t just carpet, there was something underneath it. So I tugged at it, this sensation that there was more to me, and my field of vision went white, with letters and numbers resolving a few seconds later.

I was looking at my True Character Sheet.

*Skill unlocked: Essentialism!*
The interface was different, for a start. It wasn’t controlled by my (nominal) eyes like the other one was, it was all done by thought alone, and I spent a few moments just spinning and panning to get a feel for it. My soul … was another character sheet, a deeper, more complex one, vast beyond what I was going to be able to see even if I had all day, but it was still recognizable as being structured data, and that’s really all a character sheet was.

To my left the skeleton of my body was displayed, with the bones of my ribs and left hand outlined in red and otherwise absent from the picture. I could change that display with a thought, putting organs in my belly and veins running through my limbs, layering on muscle, adding skin, until I was staring at myself. I barely recognized him; he was too muscular, too fit, with too determined of a look in his eyes. I always thought that I looked bored, when my face was resting.

Above that representation of the body was a massive network of points and lines, and I zoomed in closer to look at it before nearly getting lost in the thicket. Focusing on a point brought me into a moment, consuming all my senses; I was standing in my backyard, by the bushes, trying to eat honeysuckle like my dad had taught me, and in that moment I could smell the sweet, flowery scent and feel the light wind. When the moment was over I wasn’t quite pulled out, because there were other memories awaiting me, ones connected to this one in some way, but I was certain if I went down memory lane, I was going to be stuck looking at these things all day.

I pulled back out of the memory, then out of the thicket of memories, until I was back staring at the character sheet holistically. It was a complex nightmare of text and numbers … and beyond what I could see, there was more, because I could see faint lines leading off somewhere else, two of them. I followed one on a whim, trying to repeat to myself that I shouldn’t touch anything, that this was my soul, that any change had to be reverted immediately until I was certain that I wasn’t going to fuck things up by making changes.

The first thing I saw when I arrived at the other end of the line was Amaryllis, naked, and above her a floating mass of points and lines, and to the side, text and numbers. This, then, was her character sheet. Twinned Souls, that had linked us on more than just a figurative and mechanical level, it had opened up her soul to me. The other line would be the one belonging to Fenn. I backed out of her character sheet almost immediately, not stopping to look at anything there, not wanting to accidentally hurt her, or change her from the way she was.

I was slightly relieved when I went poking around in my character sheet, because so many things seemed like they were locked off to me, beyond my power to fuck things up. Unlike on my regular character sheet, here the things I couldn’t interact with were still readable, the grey of the text still dark and bold enough that I could parse it, with a fair number of other things in a dark, foreboding red, the only color in a sea of monochrome aside from a light blue seen on some of the text. What I was looking for were skills --

At the thought, my view panned and they arranged themselves in front of me, not just the ones that I had unlocked, not just the forty that were on my other character sheet, but more than that character sheet could even hold. I quickly counted the edges of the ordered grid and frowned. There were, if I was reading it right, two hundred and fifty-six skills, a little over half of them marked in red.

Some of them were presented in the same dark red I’d seen in a few other places in my exploration of the interface, and the one labeled “Ice Magic” caught my eye. I expanded it to read it closer. Instead of a number, it had a diagonal slash, and the text box beside it read “Deprecated, Exclusion #16”. I frowned at that for a moment -- I would need to cross-reference with The Exclusionary
Principle, Seventh Edition, but I was pretty sure that ice magic was considered a lost art, not actually excluded. Just beneath that, there were listings for a primary and secondary attributes, Cunning and Endurance, respectively, with familiar numbers in place, and what looked like a small, greyed out button labeled “Gestalt”.

I backed out of that view and quickly went to look at others and confirmed what I’d been hoping was true; the primary and secondary attributes were exposed here, and though there was no indication of what the actual math was, that was already an incredible boon from Soul Magic (or Essentialism, as the game called it), even without being able to interact with any of it. I was still being careful not to touch anything, only to look at what I could see, but I was already starting to feel the possibilities available to me.

There were 256 skills in total, and I had only 40 of them, with just 25 of them unlocked -- 26 now, with Essentialism added to that list. Once I saw the pattern, it was fairly easy to distinguish between them; blue was the color given for the skills that I had, with a slash to mark the ones that I hadn’t unlocked yet. I looked over the remaining fourteen skills that were blue with a slash, which I presumed were the ones on my old character sheet that I hadn’t unlocked yet.

I had Shotguns, which I had never tested and would be easy enough to pick up. Four of them were arts-and-crafts skills: Alchemy, Livestock, Smithing, and Woodworking. Five were magics that I had expected I would have access to: Gold Magic, Revision Magic, Steel Magic, Velocity Magic, and Wards. Water Magic was there too, which I hadn’t expected, because it was supposed to be a bloodline magic. Library Magic I had never even heard of, and I was pretty sure that I knew all of the types of magic that Amaryllis knew, which should have been all of them. I had no clue what Spirit did.

There was a Language skill, with KNO as primary and CHA as secondary, but there was no indication what was needed to unlock it. It was while I was looking at that one that I felt a thread that could be pulled, and when I did, I dove in deeper to the skill, until I was within a cloud of words. There was data attached to each of them, numbers and sliders, with labels like “Frequency” or “Tonation” or “PoS”, all of it presumably representing how often and in which ways I used the word “venerate” or “cucumber”. They were linked to each other, in ways that I would have to untangle later, if any of this turned out to be important.

A quick look at the other skills showed something similar, now that I knew where to press, but instead of simply words, and static rules governing those words, there were pieces of procedural and declarative knowledge, displayed in either text or color-coded displays of simple, prototypical actions. Skills existed as constructs in the soul then, but they were at least in part composed of other discrete pieces.

But my attention wasn’t really on the things that my character sheet contained, or even the nature of skills, it was on all the other skills, the ones that weren’t on my original character sheet, for whatever reason. Most of the ones in red were magic of some kind or another; Glass Magic, “Deprecated, Exclusion #112”, Groove Casting, “Deprecated, Exclusion #217, Constriction Magic, “Deprecated, Exclusion #18”, on and on. Some were ambiguous as to whether they were magic or not, like Ex Nihilo, “Deprecated, Exclusion #216”, and I wasn’t quite sure how I was supposed to know what, exactly, a skill with that name was supposed to do.

I could see straight away that there were more exclusions than there were exclusion zones as reckoned by Amaryllis, though her definition was taken from the political terminology of the Empire of Common Cause, and there were a lot of skills that had been taken out of the running, not that I had (as yet) tried to turn them blue.
The other, mundane, greyed skills were less interesting to me, except in regards to what they said about the game. There were, as it turned out, a handful of armor skills: Light Armor, Medium Armor, Heavy Armor, Unarmored, and Shields. That didn’t make too much sense to me though, because it was clear that armor still did something for me, and I had gone through a period of acclimating myself to the armor, which meant that I should still have something beyond just no skill in it. If I were writing a book of attributes about myself, that would have to be in there, right? You couldn’t just leave a zero there, if you were trying to fully describe me.

There were other skills that I had already known I didn’t have, and which weren’t assigned, more of what I considered arts-and-crafts, the sort of thing that you took more for roleplaying purposes (and/or to piss off Reimer because they were suboptimal), things like Weaving, Foraging, Tailoring, and so on, maybe a few dozen of those. There were transportation skills, like Sailing, Piloting, and Riding, along with utility/profession skills like Appraisal, Management, Leadership, Logistics, and Mathematics, some of which did catch my eye, and a few social skills that I was missing too.

This all left me with the question of why I had those forty specific skills on my character sheet. I had long had a feeling like someone else had set the game up for me, starting back when I had first looked in the options and seen that Diamond Hardcore Ironman Mode was checked. I might have accepted it if those skills represented things that I’d known or done on the real world, but they didn’t -- as evidenced by Piloting not being one of my skills, despite the fact that I could semi-competently fly a helicopter, and all the magic I had access to.

That meant my best guess was that the Dungeon Master had set everything up, and I had no idea why he’d decided on those particular skills. Was I meant to use revision magic at some point in the future, and that was why it was listed? On seeing the other options available to me, I desperately wanted to change my skills, but if there was a path in front of me … well, then surely Essentialism was on that path, and I didn’t need to worry too much. But then why would the Dungeon Master give me specific skills that he knew I was going to drop, assuming that he did know?

I was about to move away from the skills, because there was more of my soul to explore (quite a bit more), but I stopped for a moment and looked in at Deception. As soon as it filled my view, I got an error message in red:

**Error: Illegal Construction, Gestalting Deprecated, Exclusion #4**

The skill informed me that it was actually a gestalt between Lying and Stealth, with two primary abilities and two secondary abilities, but gave no real information about what that meant. In the parlance of D&D, “gestalt” meant merging two things, usually classes, such that they were more than the sum of their parts, but I wasn’t sure that fully applied here. The problem with gestalting was that it usually increased the power level, and there was rarely a reason not to do it, if it was allowed. And apparently, it wasn’t allowed, except that I had been running around with it like that for my entire time on Aerb, and I wasn’t about to go changing it now if I didn’t have to.

The last skill I looked closely at was the one labeled “Custom”, which was in red. Like Spirit, there were no associated skills for it, but there were buttons where the text would normally go. It looked very much like this was a “roll your own” type of skill, the kind that you included in case someone wanted something truly outside the box. That apparently wasn’t an option for me, because it was “Deprecated, Exclusion #17”.

I backed away from the skills and continued looking at my soul, not so much as an earnest exploration to gain information as it was to get a lay of the land. I would need to come in later and look at everything in detail. Fallatehr had said that values were part of the soul, which meant that there was some way to view them, and maybe change them. I had to think that there would be
something like a social network as well, some conceptualization of the internal models I had of various people, as well as physical models of various things, which would be how my brain knew that when a ball went up, it was going to come back down again.

Mostly, I kept thinking that this wasn’t how people were built.

People were really freaking complex. They weren’t a list of attributes, or neat piles of declarative and procedural memories, they were messy, complicated things that didn’t always make sense, there were contextual shifts and a plethora of messy models and hidden assumptions, it wasn’t just numbers. And as far as I could see, the soul as presented to me was missing half of the picture, which was the matter of how all these little bits and bobs actually did anything. So far as I had seen, the “soul” didn’t have all that much in the way of process or algorithms or any kind of decision-making in it, only weights that could be applied to some decision tree or neural network or whatever else it was that took this static information and let it actually do anything.

It took me some time to find the place where values were stored, which was shown as circles of varying sizes, all clustered together and packed tight. I looked over it in dismay, and not just because circles were horrible for data visualization. The biggest, by quite a large margin, was simply labeled “Level Up”. It wasn’t bigger than the next two, “Tiff” and “Fenn” combined, at least so far as I could tell, but the human eye was kind of garbage at distinguishing between surface area of circles, and it was ambiguous whether the data visualization was meant to be read as surface area or diameter.

With a push of thought, it all rearranged itself for me, abandoning the circles to show me a simple ordered list, with the highest at the top and lowest at the bottom. That was something that I was going to have to get used to, that the information as presented to me was mutable and could be rearranged as I pleased in order to see what I wanted to see, without any apparent cost. The list seemed to go on forever, but I’d seen from a quick glance at the circles that some kind of power law was in effect. I didn’t particularly like looking at the list though, since it had too many hard truths to it. Arthur was sixth, and what did that say about me as a person? What did it say about me that Tiff still loomed so large? And I could see that both Earth and Aerb were on there, enormous conceptual entities, but still below the people that mattered most to me.

I looked closer at the one labeled Aerb, because it seemed neutral enough, and got more information on it, variables like “Weight”, “Scope”, “Marginal Utility”, and “Time Sensitivity”. I backed out without reading more, then shifted my view away from the values so I wouldn’t have to look at Arthur in the number six spot.

I kept thinking that this was not how humans were. Let’s say that you actually could take someone through a trillion different tests, pairwise comparisons like “Would you rather eat a hamburger from Culver’s or spend twenty minutes playing Tetris, a year from now?”, and then you crunched that enormous amount of information, the result that you got back wouldn’t even be that sensible, because people weren’t sensible, concepts were shifting and mercurial, I could think differently about a given person based on the last word out of their mouth, or the setting I was in, or any number of things. That was, to my understanding at least, how the human brain worked.

The soul, as it was presented to me, made sense as the sort of thing you could maybe pull from a brain, if you had some hypertechnology and were willing to cut some corners in terms of how you were mapping out what the brain actually was. You couldn’t capture everything, not really, but you might be able to put a number on time sensitivity of value, maybe, and then make a chart that would be a little bit useful. The soul made sense as a report, or a visualization. That wasn’t what the soul purported to be though; it was meant to work as the mind, not just a report on it, and changing the soul meant changing the mind. Was there some hidden conversion process in there? Was this just a
game interface covering something vastly more complex, for all the data that was exposed to me? Or was I really reducible down just this stuff and whatever sort of thing was involved in actually running it?

I felt a hand touch my knee.

I was only dimly aware of my body, and blind on top of that, but I could feel the pressure there, and I flailed my body, which was still thankfully under my control, while trying to back out of the interface -- trying.

**Error: Illegal Construction, Gestalting Deprecated**

I started to panic, just a little bit. I could feel my body, I could move my body, but my eyes were stuck staring at my soul, and it felt like my mind had been made to focus on the substance of the soul. Even as I was aware that I was in danger, right across from Fallatehr, I could feel that thought slipping away from me and the contemplative mood I’d been in returning. I tried my best to shrug it off -- I was standing now, I was pretty sure, and nothing was touching me aside from my feet on the ground, though the sensation was so far away it was hard to tell for sure.

I raced over to the skills and zeroed in on Deception, which I knew had to be the problem, and dove into the menu for it, where a button labeled “Divide” was available, in place of the “Gestalt” that was on the other skills. I gave it a mental push, which presented me with warnings.

**Warning: Dividing skills will reset both to 0.**

**Warning: Skill changes can be done once per (100 levels / skill in Essentialism).**

But I did it anyway, because I was blind and barely aware of my body, and the more time I spent looking at the menus the more I felt myself start to lose sight of that fact, like it was somehow unimportant that I was disabled in front of someone who really shouldn’t have touched me. So despite the warnings, I plunged on ahead.

**Error: Illegal Construction, selected number of skills exceeds 40.**

I went in and unselected Woodworking, which I didn’t think that I would ever use, and was about to make another attempt at leaving the soul before I stopped myself, only momentarily.

(My concern was with the warning that skill changes could only happen once every 100 levels divided by the skill ranks in Essentialism, which a quick check showed as currently sitting at 5. Depending on whether previous levels counted or not, that meant that I’d be able to change skills again at either level 20 or level 30. Obviously I would be able to level Essentialism up from where it was now, but there were rather severe diminishing returns on that math, especially assuming that rounding wasn’t done in my favor.

(A quick check of Essentialism showed that it had WIS/KNO as its primary and secondary skills, which I considered good news, given that it meant I could continue on with my dubious strategy of leaving SOC behind, if I so chose.

Either way, there was a hard cap on when I’d be able to change skills again, even with reasonably optimistic assumptions, and if changing my skills to fix the gestalt error counted as changing skills, then the next time I would be able to change skills would be in four levels or so, unless the game let me bank skill retraining from levels previously gained, in which case this was merely the squandering of an extremely limited resource, rather than a handicap that might last for as long as a few months.)
So I started in on cuts, first the things that I didn’t see the point of and hadn’t even unlocked, Alchemy, Smithing, Woodworking, Livestock, and then the ones that I didn’t have unlocked and thought were subpar, Gold Magic, Shotguns, Steel Magic, Wards, snip, snip, snip, freeing up space, and then Music and Art had to go, because they were flavor, not utility, and I watched the warning go by about them resetting to 0, not a big loss in either case. Finally, Pistols, which I hadn’t been bothering to train up given that I’d almost always be using a rifle at range and melee weapons up close. Snip.

And that was ten slots freed up, and I could cut a few more, like Spirit, which had no obvious function, and Library Magic, which I had never heard of, but I was erring on the side of not locking myself out of things I didn’t yet know the function of.

(It was tempting to cut the social skills, to cut Comedy, Romance, and Flattery and make room for something else, but my social abilities were already poor, and if anything, I needed a few of the social skills that I was missing in order to shore up that deficit, assuming that I wasn’t always going to be able to rely on Amaryllis to carry me through difficult times, even if she was physically present.)

So I started adding skills back into the mix, Shields, Unarmored, Medium Armor, Heavy Armor, all to provide survivability, then varieties of magic I didn’t have, some of which were mysteries, Vibrational Magic, Still Magic, Tree Magic, Fire Magic, and then with two left I hesitated and hurriedly picked up Analysis and Debate, with little clue as to what they actually did aside from the fact that they were mental-affiliated.)

If I’m being honest, which I do try to be, I’m not sure how long I spent on all that. Maybe I came under the tunnel vision effect of looking at these things again, because I’d had that moment of hesitation when I’d been ready to move away, when the gestalt had been removed.

Either way, I came out of it slowly, feeling my pulse first and my extremities second, and only gradually regaining my sight. I was standing with my sword drawn and held in front of me, looking at Grak, who had placed himself between Fallatehr and myself. His axe was drawn and held back, ready to strike; I couldn’t tell how long he had been in that pose. As soon as he looked back to see that I was alert, he crossed over to me, putting himself so that he was still standing slightly in front of me, guarding me. I glanced over and saw Null, sitting within the box of wards that Grak had made for her.

“What happened?” asked Grak, his voice tight.

“I was going to ask the same thing,” I said, looking to him, then the Fallatehr.

“I did not believe you would actually do it,” said Fallatehr. “You understated the depths of your prodigy. There is a seductiveness to looking at one’s own soul, a seduction that is -- was, in the halcyon days of the Second Empire -- trained against, in parallel with the other studies that allow a soul mage access to their soul.”

“Who touched me?” I asked.

“I did,” said Grak. “I tried to rouse you.”

I nodded at that.

Yes, I had gone under and gotten tunnel vision, then Grak had seen me sitting there like a moron and maybe asked some pointed questions to Fallatehr, who was probably an ass about the whole thing. Grak had touched me on the knee, wanting to bring me out of the stupor or at least ensure that I was
alright, and I had reacted by flailing around like a madman, which had naturally raised his suspicions. That was certainly one plausible series of events.

Unfortunately, it also was the series of events that cast Fallatehr in the best possible light.

“Does the nonanima have a name?” I asked Fallatehr.

“No,” he said, glancing over to her only briefly.

“Nonanima, would you like to have a name?” I asked her.

She stared at me, then nodded slowly.

“What are you thinking?” asked Grak.

“One second,” I told him. I cleared my throat and looked at Null. “What would you like your name to be?” I asked her.

Loyalty Increased: [Null Pointer Exception] lvl 4!

“I don’t know,” she said in a soft voice, almost too soft for me to hear her.

“Well until you choose, I’d like to be able to call you something, so I’m going to call you --” Tiff -- no, not that, dammit, why is coming up with names on the fly so difficult? “-- Valencia, or Val for short, it means strength, where I come from. If you ever want me to call you anything else, you let me know, okay?”

“Okay,” she said.

“What are you doing?” asked Grak.

“She’s a neutral observer,” said Fallatehr. “She has no soul, and thus, she can be depended upon to accurately recount the events as they transpired without interference on my part. Not that I could have moved through the ward you set up to touch her.”

There was something I really didn’t like about having the adversary outline my plan for me, then explain how it was a good and clever plan. I could already see the hole, which was that Null -- no, Valencia now, I had named her -- that she wasn’t actually a reliable source of information, she’d spent most of her life in Fallatehr’s care, she was about as broken of a person as I had ever seen … and even if Fallatehr hadn’t thought ahead to make sure that their stories matched, Grak had already fed her the lines that she was supposed to agree with. In hindsight, I should have separated everyone and talked to all of them individually, but that level of paranoia hadn’t occurred to me as I was coming out of the fog and wondering what had happened. Worse, there didn’t seem to be any telling details that I could catch them on, especially given how notoriously bad eyewitness accounts were even moments after the event in question.

“You’re worried that I’m compromised,” said Grak,

“Yes,” I replied. I looked to Valencia, trying to make that new name stick in my brain. Null was too derogatory of a name, too close to calling someone Nothing, only Null was worse, because it was less than nothing. Valencia. I shouldn’t have been the one to name her, not like this. “Valencia, can you tell me what happened?”

She looked to Fallatehr. “It was like they said.”
Was this a matter of loyalty, or conditioning, or something else? Or was she simply telling the truth? It bothered me that I had no way of knowing, but her testimony was weak evidence in favor of the official line.

“I don’t know whether or not you’re compromised,” I said to Grak. “And I don’t know to what extent it’s possible for soul magic to compromise a person.”

I had an uncharacteristic yearning for Earth at that moment, as some leftover part of my internal programming had me reaching down into my pocket to pull out my cell phone and check the time as a nervous habit, or maybe a way to get grounding. I wasn’t even wearing proper pants, just greaves that were more white than the metallic blue they’d started the day as.

“You are right,” said Grak. “I should be quarantined from Fallatehr and everyone else.”

I looked at him, trying to judge what kind of response that was. It was true, and more weak evidence, but it was nothing that I could actually count on.

“Okay,” I said. “We’ll just keep the four of us separated for now, until Amaryllis comes back to get us.”

“He said that a soul would revert to a coherent state over time,” said Grak. “All we should need to do is wait it out.”

“Yes, but the trouble is that he said it,” I replied. “This is the same man that didn’t tell me I could get stuck looking at my own soul.”

Fallatehr’s lips twitched. “I am not your enemy,” he said. “Our relationship as teacher and student cannot survive if you continue to think of me that way.”

I shrugged. “In the future, if there are risks like that, even ones you don’t think that we’ll run into, I need to hear about them before experiencing them firsthand with no forewarning.” I didn’t say it, but if it happened again, I wouldn’t think too hard about killing him. I picked my folding chair up from the ground and propped it up, then sat down in front of Fallatehr. “Okay,” I said. “Let’s continue the lesson.”

“Are you serious?” asked Grak.

“Yes,” I said. “We still have time left until Amaryllis comes back, and the more I know about the soul, the better.” Fallatehr knew that I had seen my soul, though I didn’t think that our views of the soul were the same, given how steeped my view of the soul was in game mechanical terms.

“I think I am done with lessons for the day,” said Fallatehr, looking me over. “I will need to think on what other pitfalls might await you, in your accelerated journey to become a magus of the soul.”

“My hand,” I said, holding it up. “That’s the thing that we need to fix.” I still hadn’t told him about my ribs, but that was something I was going to keep under my hat for the time being.

“You saw the soul,” said Fallatehr. “I wouldn’t imagine that most of it made sense to you, but there is a portion of it devoted to the bodily self.”

“Yes,” I said. “And how do I fix this, exactly? How do I translate the existence of the soul’s image of the body into actually fixing the damage that was done?”

“You want me for more than this?” asked Fallatehr. “You have uses for me as a teacher, beyond this simple repair?”
“Yes,” I said, hoping that I was a bad enough liar that he would believe me when I told the truth.

He watched me for a moment with narrowed eyes. “You will need training in how it’s done, but you have two hands,” he said, holding his hands out in front of him, palms pointed to the night sky. “The bones of the right provide a blueprint that can be mirrored.”

I looked down at my left hand and the way the skin didn’t quite fit around bones that weren’t quite the right length. I frowned at it. “My hands aren’t symmetrical,” I said. “I mean, even before this, they weren’t.”

“They will be,” said Fallatehr.

I was about to object that the veins and arteries wouldn’t line up properly, that there would be nerve damage … but the soul already contained all the information about those parts, it was the bones that were missing as what I thought of as a local copy of that information. I wasn’t even sure at what level the soul actually stored that information, because it seemed like at least some of it could be assumed from basic knowledge about the human body, and if you were building efficient data structures, you would be better off with just having a diff between some ur-body and the individual body in question.

“And if I didn’t have a right hand?” I asked.

Fallatehr pursed his lips. “It takes quite some time for the soul to recognize substantial damage to the body,” he said. “It can be years before scars become marked on the soul itself, and sometimes the soul will persist in its counterfactual conception of the body forever.”

“Hypothetically,” I said. I was giving something away to him, providing him with leverage, but I was thinking about my ribs, the anemia, the loss of appetite, and the fact that I had used the rib bones on both sides, meaning that there was nothing to easily copy and paste with a little bit of mirroring on the z-axis.

“Hypothetically, you would have to take from the soul of another,” said Fallatehr. He watched my expression, and the grimace that I didn’t try to hide. “‘Take’ is an approximate term,” he said. “The term ‘copy’ might be better. But for that, you would need access to the soul of another, either one whose body is compatible with your own, or with the delicate power necessary to alter those conceptual bones prior to insertion. The process would be much more difficult and prone to failure, especially without my guidance.”

Amaryllis appeared some distance away from us, more than a hundred feet away, with a soft pop and a brief bit of light that was startlingly bright in the middle of the night. She was in full armor, helm up, and with her sword out and ready as soon as the teleportation key was safely stowed. She looked toward us, hesitant. “Status?” she called.

“Grak should be assumed compromised,” I called back to her.

“Fuck,” I heard her mutter under her breath as she walked toward us. She stopped some twenty feet away, sword still in hand. “You know that means that you’re assumed compromised too,” she said.

“That’s -- yes,” I said. “In theory, we should assume that everyone is compromised.”

“Such distrust,” said Fallatehr, making no attempt to hide his amusement.

“I know a little bit of soul magic now,” I said.

“Enough to fix you?” asked Amaryllis.
“No,” I said. “Working on my own, it’s a possibility, but I’m not there yet, and even the process of looking at my soul makes me far more vulnerable than expected.”

“Ah,” said Amaryllis. Her helm hid her eyes, but I could guess that she was looking between us, thinking. “The nonanima is an unreliable eyewitness,” she said.

“Yes,” I replied.

“What about the Eternal Golden Braid?” she asked.

I froze at that, because the thought hadn’t even occurred to me. I reached into my pack and took Ropey out. I was almost certain that he didn’t have a soul, which meant that he would have made a really good lookout. Overlooking him was almost inexcusable, but I was fairly sure that Amaryllis hadn’t thought of him either, because otherwise we could have used him as insurance against malfeasance in the first place. “He was in my pack from the time we scaled down the wall.”

“Suspiciously inconvenient,” said Amaryllis. Her sword was still in hand.

“Poor planning,” I said. “On both our parts.”

Amaryllis sighed. “We have time, two hours until the key is ready again. We’ll stay quarantined from each other until then.”

“We had already decided that,” said Grak.

“Soul magic is not so powerful as you believe,” said Fallatehr. “If it were, the Second Empire would not have crumbled as it did.”

“We don’t know what your further research might have produced,” said Amaryllis. “I’m sure that you understand our perspective on the matter.”

“Yes,” nodded Fallatehr. “It is somewhat amusing, to know that nothing was done and see all this effort going to waste.”

“I’d like us to talk to Valencia,” I said, nodding at the nonanima. “I picked a more respectful name for her.”

Amaryllis frowned. “She is unreliable.”

“Yes,” I said. “But,” I struggled with how to phrase it, conscious of Fallatehr listening in. “I doubt that she’s a perfect liar, and I was hoping that I might be able to gain her loyalty.”

Amaryllis nodded, the metal of her helm clinking once against her breastplate. “Not a perfect solution,” she said. “But one worth pursuing.”
We separated Grak from Fallatehr, putting both of them one hundred feet away in opposite directions. Fallatehr was downright cheery about it, either because he was legitimately amused by the paranoia we were displaying, or because he knew that what we were doing didn’t make a bit of difference, or possibly as a bluff.

“I agree with sequestration,” said Grak. “If I have been altered, we don’t know how long it would take to wear off, if it will at all. We should think of a long term solution. My wards are untrustworthy to you now.”

“You’re being very good about this,” I said to Grak.

“It’s the standard we need to have,” said Grak with a sniff from his wide nostrils. “It needs to work without trust.”

“Or rather, trust, but verify,” I said with a nod.

Grak frowned at that formulation of it, since apparently that wasn’t an expression here, but nodded.

“Tell me what happened,” said Amaryllis, as soon as he was far enough away that he couldn’t hear us. All the principal players were some distance apart from each other now, aside from Amaryllis and I, who stood beside each other. She took off her helmet while waiting for my response, and I could see the fatigue on her face.

“Fallatehr gave me a good enough description of soul magic that I was able to access my soul,” I said. “There’s apparently a compulsive effect associated with it -- like a siren song, if that’s an expression here.”

“We have sirens on Aerb, yes,” said Amaryllis.

“Fallatehr didn’t tell me about the effect ahead of time, so I got sort of … in the zone, I guess, wrapped up in exploration. I guess I would call it a zen state.” Amaryllis shook her head marginally. “Oh, um, it’s … that feeling when you’re going with the flow unselfconsciously. Anyway, that went on for an indeterminate amount of time, until I felt someone touch my knee. I was still in a condition where I could react, but I was blind, and it took some work to leave my view of the soul, again, an indeterminate amount of time, but I think probably less.”

“Shit,” said Amaryllis. She looked over at Grak. “So it’s either him alone, or both of you.”

“Both?” I asked, furrowing my brow. “Ah, because you think that if we were both in his thrall, his strategy might be to have suspicion cast on Grak in order to make me appear clear. Seems a bit complex, when he could just have directed both of us to act natural.” I supposed that good cop/bad cop had its charms, but it seemed like an over-complicated scheme to me.

“Agreed,” said Amaryllis with a weary sigh. “I should have asked Fenn for stimulants before I left. Let’s go talk to the nonanima.”

“Everything went well on your end?” I asked. “Fenn is alright?”

“We have a place to stay in Parsmont,” said Amaryllis. “Purchased at unreasonable expense, but with all the amenities we need to bunker down, and without much in the way of neighbors. I was counting on wards from Grak, but those aren’t reliable anymore. We’ll have to make do.”
We reached Valencia, who looked between the two of us with wide eyes. I lit my hand on fire with blood magic in order to give us a bit of light.

“It hasn’t been read in?” asked Amaryllis, looking at me.

“She, not it. And no,” I replied. “We haven’t had any time alone.”

“She could be possessed, even now.” said Amaryllis. She seemed heedless of the fact that Valencia was standing in front of us, watching us, listening to what we said.

“I’m not possessed right now,” said Valencia.

“The only information that statement conveys is that you’re not a demon,” said Amaryllis. “Congratulations on that.”

“Don’t be a bitch,” I said. I regretted that after it came out of my mouth, because Amaryllis and I didn’t have the sort of relationship where she would take that as chiding. Maybe I was more tired than I’d thought I was.

“Sorry,” said Amaryllis, rubbing her face. “I’m tired, this is …” she gestured at Valencia. “It’s a bad idea.”

“She has an affliction,” I said. “I’m not going to devalue her over something that’s completely beyond her control.”

*Loyalty Increased: [Null Pointer Exception] lvl 6!*

Her loyalty was climbing fast. I was hoping that giving her a name would have given her a name on the game layer, but no such luck. I was also a little bit worried about what was going to happen when she hit 10 Loyalty. Amaryllis and Fenn had Twinned Souls with me, and Valencia didn’t have a soul to twin to. I didn’t think that it was possible to crash the game, but I was still a little leery.

(I didn’t actually think that the null pointer exception was ‘real’, given that the simulation displayed startling sophistication in almost all other regards, and I would have thought that to get something like this running, writing pristine code would be a must … but on second thought, there was nothing to say that the various layers of the game hadn’t been cobbled together by different agents working on different goals, and it was entirely possible that I was living in the equivalent of a triple-A game that someone had downloaded a lot of half-baked mods for.)

“Besides,” I continued, “It should be easy enough to tell whether she’s possessed, all we need to do is pre-arrange some codewords.”

“Possession implies access to memories,” said Amaryllis.

“Um,” I said. “Shit. For just a nonanima, or for anyone?”

“From what I know, it’s very difficult for a devil that’s taken possession to comb through the memories of the possessed, especially if they have to do it while maintaining a conversation,” said Amaryllis. “For a nonanima, it’s as though those memories were their own.”

“Shit,” I said again, looking at Valencia. “Meaning that we can’t use codewords, because they’d be instantly compromised.” I met Valencia’s eyes. “Do you have any ideas for how we could get around that?”

“No,” she said, shaking her head. “I’m so, so sorry.”
“It’s okay,” I replied. “We can work around it. Can I ask, are you aware of what happens when you’re possessed?”

“Yes,” nodded Valencia. “I wish so much that I weren’t.” I opened my mouth to speak, but she rushed on. “It’s like I’m a glove that someone is sticking their hand into.”

“I’m going to figure out a way to stop that from happening,” I said.

**Loyalty Increased: [Null Pointer Exception] lvl 7!**

“On to the interrogation,” said Amaryllis with a short yawn. “Joon, you realize that if she’s possessed by a devil, that devil will give us the exact wrong answers?”

“Yes,” I said. “And if it can read memories like they were its own, then that’s a serious problem. I was thinking that we could just re-ask over and over, but that doesn’t actually work, because a second devil could build off the story the first one told, and a contradiction doesn’t actually mean that much, because devils could contradict each other just to reduce trust.”

“You’re not treating her like enough of a problem,” said Amaryllis. “You’re being academic about it. Demons and devils exist almost purely to cause pain and suffering.”

“Almost?” I asked.

“They’re as imperfect as people are,” said Amaryllis with a shrug. She turned toward Valencia. “Isn’t that right?”

Valencia nodded slowly.

“So tell me what happened while I was gone,” said Amaryllis.

“The dwarf, Grakhuil, put up a ward around me,” said Valencia. “He sat in front of me, watching me while he ate. He didn’t offer me any food. He was listening to Fallatehr and Juniper. When they stopped talking, he went over to see why. Fallatehr kept saying that Juniper had fallen to the soul trance and would need to be pulled out of it sooner than later. Grakhuil kept asking questions that didn’t go anywhere. He went over to try to bring Juniper out of it, and Juniper got violent at the touch. Grakhuil and Fallatehr both talked a lot after that but they didn’t really say anything. It was all about the soul trance. Then Juniper came out of it on his own. Fallatehr didn’t touch either of them.”

Amaryllis rubbed her eyes for a moment and took a breath, then looked at me. “Well, that’s not helpful. On a scale from one to a supposed maximum of twenty, how much should we trust her?”

“Seven,” I said. “Conditional on her not being possessed at the moment.” Loyalty was a less valuable metric than normal here, given the circumstances.

“That high?” asked Amaryllis.

“Seven,” I nodded, then turned to Valencia. “But … no offense, Valencia, but you’ve been with Fallatehr your entire life?”

“Seven,” she said. “I was born in the prison.” She looked around her, then toward the walls of the penitentiary. “This is my first time seeing the rest of the world.”

That one hit me hard, because we were still on the same small, flat, mostly featureless island. We hadn’t gone more than a few hundred yards from the walls of the penitentiary, and that was further than she’d ever been in her life. Unfortunately, I was pretty sure that the next bit of her life wasn’t
going to be me showing her around Aerb and having a good time. We couldn’t even safely remove the manacles from her, not without wards, and we couldn’t trust the wards anymore.

“Either she’s lying to us, possessed by a devil that’s lying to us, or we’re legitimately in the clear,” said Amaryllis.

“So, two in three chance,” I said. Amaryllis frowned at me. “That was a joke.”

“Yes, I’m well aware,” said Amaryllis.

“The question is what we do,” I replied.

“That’s not something that we’re going to discuss in front of her,” said Amaryllis. She started walking away without asking my opinion on the matter, and I shot an apologetic look at Valencia.

*Loyalty Increased: [Null Pointer Exception] lvl 8!*

Her Loyalty was going up frighteningly fast.

“Okay,” said Amaryllis, when we were out of earshot. “Our biggest problem at the moment is that Grak has to be assumed compromised, which means that we’re going to have to sleep in shifts, because we can’t just put up wards to protect us from Fallatehr and his people.”

“And they aren’t going to need to sleep in shifts, so they’ll get an edge on us that way,” I said.

“Minor, maybe, given that we have no pressing issues beyond my education.”

“We’re all run down,” said Amaryllis. “You less than me, it seems. It’s three on five, and we can’t leave Grak with them, which is a complication that we might not be able to afford.” She looked over at Fallatehr, who was sitting in the lotus position far away with his eyes closed. “Smug fuck. Fenn is of the opinion that we should kill him as soon as you have the skill unlocked, and I’m inclined to agree.”

“But I already have it unlocked,” I said.

“Yes,” said Amaryllis, not taking her eyes from Fallatehr.

“More importantly, I’m not sure how easily I’m going to be able to raise the skill above the soft-cap of 20 without someone to teach me,” I said.

Amaryllis turned her tired eyes toward me. “You understand how that sounds to me?”

“Oh,” I said. “Ah, yes, it sounds like I’m offering up a defense of him because he got to me.”

Amaryllis nodded.

I rubbed my face. I was starting to flag too, though I thought I still had reserves left. “I do think that I might be able to heal myself without any further aid from him, because Essentialism -- that’s the skill name -- went up just from poking around and changing a few things --”

“You what,” said Amaryllis.

“I had to,” I said. “I didn’t have any choice in the matter. Essentialism is a second game interface, or maybe third depending on how it’s counted, and there were game messages that prevented me from leaving until I fixed something that had apparently been there since the start. While I was doing that, I made a few very minor changes, because the interface told me that I wasn’t going to be able to alter them again for another few levels, at the very least. The skills are what I had to fix, and they’re all
Well, it was actually 257, since I had split Deception and Stealth from each other. My guess was that it was two to the eighth, plus Custom for any number of skills I might have wanted to create on my own. But Custom was excluded, as were a whole host of others, so that was somewhat moot. I was going to have to compile all the new information and figure out how it lined up with recorded history. It was already my guess that the exclusions were in numbered order of when they’d been applied and would match up with what was laid out in The Exclusionary Principle, but I would need to check -- and there were a whole lot more skills listed as excluded than there were exclusion zones.

“Okay,” said Amaryllis, shifting uncomfortably and breathing out with clenched teeth before becoming calm again. “Can I ask you nicely not to touch your own soul again, not under the guidance of Fallatehr, and not until we’ve had a chance to talk it over?”

“Yeah,” I said. “I didn’t feel like I really had an option, and the game itself informed me that it could be undone later, if we really need it to.” I was more worried that the specific skills I’d started the game with were going to be vital somehow and I’d run into their hidden purpose before getting another chance to rearrange my skills.

“Any other surprises I’d find unpleasant?” asked Amaryllis.

“Our souls are linked, probably by the Twinned Souls thing that powered you up at Loyalty 10, given that it’s only a connection to you and Fenn, not Grak and the locus -- or Valencia,” I said. “I can access your soul at a large distance.”

“Fuck,” said Amaryllis. “Meaning that if you’re compromised, then Fenn and I are too.”

“Meaning, I guess, that you have to assume that I’m not compromised,” I said. “Because if Fallatehr had gotten to me, there wouldn’t be anything that you could do about it.”

“I could kill you, I suppose,” said Amaryllis, looking me up and down. She didn’t seem serious about it, not like she was issuing a threat, more like she was publicly contemplating alternative courses of action.

“You could try to kill me,” I replied. (I couldn’t imagine that it was going to come to that, but I wasn’t just making a boast. She had better armor and a better sword, but I had far more magic than she did, and from what I could tell, superior melee skills.)

“Alright, fine,” said Amaryllis. “I don’t think that Fenn and I could have kept you and Grak quarantined from Fallatehr and the others anyway, not if it’s the two of us against the six of you.”

“Unless I’m lying about the link,” I said. “In which case I just told the right lie to let me into the henhouse.”

Amaryllis nodded. “True. I’m starting to think that this Fallatehr plan was a mistake.”

“Yeah,” I said. “Do you want to know everything that I know about the soul, the things that I learned from looking at my own rather than what I have to take Fallatehr’s word on? My guess is that what I see is different from what he sees, and that might give me an edge.”

“Sure,” said Amaryllis. “But you’re probably going to have to repeat it all for Fenn and Grak -- you haven’t told Grak?”

“No,” I said. “He’s assumed compromised.”
“Just checking,” said Amaryllis. She stifled a yawn. “You’re going to have to repeat it for them, assuming that we want their help, once we’ve cleared him. And I’m not in the best condition for listening.”

I told her everything anyway, in part because there wasn’t a lot else we needed to be doing, aside from maybe cross-referencing Grak’s story with Valencia and Fallatehr’s, but I had no faith in eyewitness accounts, and even a contradiction wouldn’t help us all that much. There was no way that anything they said would exonerate Grak, meaning that we’d need to keep all our precautions in place anyway. Besides that, I was operating under the assumption that if Fallatehr might have had up to a half hour to work on Grak, and some level of complicity on the part of Valencia, he wouldn’t have made any incredibly stupid mistakes.

When I was done, Amaryllis sat in silence for a moment. I could see from her posture that she’d locked her armor in place, saving her the trouble of using her muscles to stand up. “Assuming that he’s got a view remotely similar to your own, values seem like the quickest way to bring Grak to his side,” said Amaryllis. “All he would have to do is find Fallatehr on the list of values and increase the numbers.”

“I’m not sure that he gets to see numbers,” I replied. “He hasn’t given his own description of the soul, only an analogy. But yes, I think that would be the first thing that I would look at if I can get a view into Grak. And that is the fastest way to clear him, not to mention that he shouldn’t have any legitimate reason to object.” I frowned slightly. This could all have been avoided if he was more loyal to me. Twinned Souls would remove the need for his informed consent.

“We’ll have to take a look at your complete list of options later, when we have time to write everything down and make a catalog of what we know. I’m sure you’ll agree that you made some mistakes there?” Amaryllis raised an eyebrow, and I grudgingly nodded. I wasn’t confident that I actually had made mistakes, given the short time frame, the pressure, and the missing information, but I was pretty sure that when I was next able to change skills, it would be with a concrete plan and optimized build.

Amaryllis pulled out the teleportation key and turned it over in her hands. “We still have a little bit of time,” she said. “Have you checked yourself over?”

I shook my head. “The soul trance scares me. I mean, I think that it probably wouldn’t be optimal for me to try again, in addition to being scary.”

“You came out of it once,” said Amaryllis. “More time in it means higher skill in Essentialism, given what you said, and that should be the skill that governs your ability to escape from it.”

“I already know that I wasn’t affected by him,” I said. I didn’t care whether he lived or died, save for his ability to help me.

“I’d like you to check for subtle signs,” said Amaryllis. She hesitated biting her lip hard for a second. “I don’t know how much you looked at my soul, --”

“I left as soon as I realized what it was,” I replied.

“Thank you,” said Amaryllis. “We’ll … I don’t know what’s written there, but we might have to have a talk, just to clear the air. And if you have time, checking Fenn and I over for a baseline might be wise.” She grimaced as she said it, not trying to hide her distaste.

I set Ropey as lookout, then looked toward my soul once more.
I loved books. Of all the forms of mass media, books were the most personal and the most intimate, not just because they took longer to consume than anything except maybe a season of television, but because reading was something that you did in private. And maybe more than that, reading had an element of interpretation that was rare in film and television, because prose was meant to be evocative rather than strictly literal, abstract by the very nature of the medium.

So the first time I went to Tiff’s house, months before we started dating, I paid special attention to her bookshelf. We were working on our half of a group project together, just Tiff and I, alone in her bedroom together but with the door open, and I had gotten bored enough that my attention was drifting.

Most of what was on her shelf was nonfiction, and most of that nonfiction was in the form of popular, layman’s level explanations of a field or subject: books like *The World is Flat*, *A Short History of Nearly Everything*, *Thinking, Fast and Slow*, and *Guns, Germs, and Steel*. Mixed in with those were older classics, *Wealth of Nations*, *The Origin of Species*, *Plato’s Republic*, and *The Diary of a Young Girl* by Anne Frank. A section of books caught my eye, *The Second Sex*, *Sexual Politics*, and *The Delta of Venus*, all feminist works, judging by their titles, all well-read, judging by their spines. Her fiction section was less interesting, given that it held few surprises, and almost no fantasy or science fiction beyond the staple series of *The Lord of the Rings*, *The Chronicles of Narnia*, *A Song of Ice and Fire*, and *Harry Potter*, none of which really counted, since I considered them part of standard cultural literacy.

But none of that interested me as much as a set of ten slender moleskine notebooks, each one embossed with her initials.

“Let me know if you want to borrow anything,” said Tiff. “It’s not really a lending library, but I’m always happy to talk about books.”

“Those?” I asked, gesturing to the embossed moleskines.

“Ah,” said Tiff, sitting up a bit. “I’ve been keeping a diary since I was twelve. Decidedly not for lending, but you can take a look if you’d like.”

That felt like a trap to me, but I had no idea what kind of trap. I reached over and pulled down one of the notebooks and opened it to a random page. Instead of text, I was greeted with lines and dots in different configurations. I stared at it for a moment, trying to see a pattern, then gave up and looked at Tiff.

“It’s a cipher!” she said with a smile. She bit her lip as though to stop her smile from growing too indecently wide. “I made it when I was eleven, after I found my mom snooping, prior to the start of the diaries proper -- got them from my aunt, best present ever. Totally uncrackable.”

“That’s … not likely to be true,” I said.

“It was a joke,” said Tiff with a frown. “You remember us talking last week about how you don’t roll your own crypto?” We’d had a long discussion on the topic after the party had broken into a mausoleum and blown through five of my six prepared puzzles in the space of an hour. It was a conversation that I was sure would have made someone actually knowledgeable on the subject facepalm. (They’d gotten stuck on the last puzzle for about an hour, to the point where they were getting bored, which made it a bad puzzle.)

“Right, sorry,” I said. I looked down at the book in my lap and flipped through it, looking at more of the dots and lines. It took a bit to see the first pattern, which was that you could sort the dots and lines into glyphs, no more than four lines per glyph, no more than four dots per glyph. Line position
seemed to matter, as did dot position, not just whether there were more or fewer of them. “Still, having a custom cipher like this means security through obscurity, and given that it’s on paper in your room, you’re probably safe.” I looked through the pages some more. “There are more glyphs than letters.” Meaning that it wasn’t a simple substitution cipher. There weren’t spaces either, which meant that one of the glyphs indicated a space, which I didn’t think would be too hard to figure out, but it strangely wasn’t visible at a glance.

“Well, definitely not letting you borrow it,” said Tiff. “I know you’d be overcome by the urge to crack it.”

“Is there anything in here that I’d be interested in?” I asked, leafing through it again. Here and there I saw pictures, small little doodles that were set within hand-drawn boxes separate from the ciphertext itself.

“Well, definitely not letting you borrow it,” said Tiff. “I know you’d be overcome by the urge to crack it.”

“Is there anything in here that I’d be interested in?” I asked, leafing through it again. Here and there I saw pictures, small little doodles that were set within hand-drawn boxes separate from the ciphertext itself.

“Eh, it’s personal stuff,” said Tiff with a shrug. “Most people don’t care about personal stuff, except because it’s personal. Like, most of your life you don’t pay that much attention to anyone else unless they’re a close friend, and even then, probably not.”

“I think I pay attention to you,” I said. “I mean, the appropriate amount of attention.”

“Are we close friends?” asked Tiff with a raised eyebrow. “Not that I’m saying you’re not --”

“I mean, you’re part of the group,” I said. “We spend something like, I don’t know, ten or fifteen hours a week together outside of school, plus another few hours at lunch, plus more hours in class. It’s part-time job levels of friendship.”

“Yeah,” said Tiff, straightening up somewhat. “I just sometimes feel like I’m the fifth wheel.”

“Arthur, me, Reimer, Craig, Tom,” I said, counting quickly on my fingers. “You’d be the sixth wheel.” We had other members who only showed up inconsistently or for special occasions who made for seventh, eighth, and ninth wheels too.

She reached over and grabbed a pillow from her bed, which she flung at me. “It’s an expression, you dolt.”

“Just joking,” I said, batting her pillow aside. “And we do think of you as one of the guys.”

“Blegh,” said Tiff, briefly sticking out her tongue. “I hate that.”

“Guys?” I asked.

“No, ‘guys’ is normally fine,” she said. “Except in that context, where it’s clearly gendered.”

“Ahh,” I said. I set the diary to the side.

“It’s like saying that I can be part of the group, so long as I pretend I’m male, or masculine, it’s an implication of or suggestion towards tomboyism, which is fine, if you’re a tomboy, but I’m not,” said Tiff. I didn’t have much to say to that, except ‘sorry’, which felt too weak, so I kept quiet. “Arthur would have jumped at that bait.”

“Would he?” I asked. “And was it bait?”

“Arthur bait,” said Tiff with a shrug. “See, this is why I think I’m not a part of the group. Just ... makin’ things weird.” She folded her arms across her knees. “That’s the hardest part about finding new friends, you don’t have all those grooves worn into place. You don’t know how to talk to each
other, not really, not about things that are outside the bounds of the everyday normal-person back-and-forth.”

“Yeah,” I said. “I mean, I don’t really know, because it’s always been other people coming into our group, not me trying to -- infiltrate is the wrong word.”

“Like I’m a spy?” asked Tiff, smiling at me.

“Hey, I said it was the wrong word. Integrate?” I asked. “Brings up too many associations with Jim Crow to me.” I tapped the diary. “I sometimes wish that it were possible to data dump. I mean it would be, in a sense, possible for me to get to know you really well by reading through four or five years of diaries, but then you’d also have to do the same for me, and I don’t actually think that we’d get those grooves worn into each other.” That sounded a little too intimate to me, as far as imagery went, with the suggestion of friction, and I regretted it immediately. “And anyway, a diary isn’t really a record of who you are, it’s a record of who you’ve been, it’s the component elements that served to make you, not the actuality of you. It might be helpful for a reconstruction of Tiffany, maybe.”

Tiff was watching me, in a way that made me feel self-conscious. “What?” I asked.

“Nothing,” said Tiff. “Have I ever told you that I find you interesting?”

“Literally no one has ever told me that,” I replied. “They used to call me the default character.”

Tiff laughed, covering her mouth. “I am so sorry, but I can completely see that.”

“Yeah,” I said.

“But that’s not who you actually are,” she continued. “I think that’s what reading the diary would be like, maybe, you would see all this stuff in there that was totally typical of someone my age, the kind of things that are completely innocuous and interchangeable, and then packed there in the middle you’d find these little revealing sparks of me. And that’s why I don’t feel like I’m really one of the guys, because you’ve all known each other long enough that you’ve seen those flashes of truth in each other.”

“It’s like a signal to noise thing, sure,” I said. I looked down at the enciphered diary again, one of many up on the shelves. “And you’re sure that you don’t want me cracking this?”

“One hundred percent,” said Tiff. “Top secret, eyes only. If you want to get to know me, it’s got to be the hard way.”

There was a little game I played, later on, where I tried to figure out whether she had been flirting with me, or saying things that were meant to have double meanings. She was self-confessedly bad at giving signals, and in that heady state of infatuation (and later, love) I kept seeing strands of it in every interaction we’d ever had. It was hard to know whether I was just making things up, when I played back those memories over and over.

She was right about the diaries. I didn’t think that they contained anything all that important, because my own diaries would probably have been equally uninteresting, and she was ready and willing to tell me anything that I wanted to know about her. But because there was a puzzle sitting there waiting to be solved, and because it was information that I wasn’t allowed free access to, my eyes were drawn to her neatly ordered diaries every time I came over.

I looked to my values first, because from what I knew about the soul, that was the first thing that I would change if I wanted to quickly manipulate someone. The list could be dynamically reordered
based on the parameters that each value had, but it was easier to just think in the direction of a concept and see its place on the list. “Fallatehr” was on there, with a negative value attached to him, and I felt like that was probably enough to clear myself of suspicion. Just to be safe, I went after a few related concepts, like “Soul Magic” and “Elves”, but neither was terribly high in the rankings, and certainly not higher than I thought they should be in principle, nor were those values in conflict with my memories of how I had felt about those things.

I had to assume that Fallatehr wasn’t all-powerful, because if he could rewrite all my values, and my memories and expectations of those values, then there was pretty much nothing that I could do to detect him or counter his ability in any way.

I was already expecting him to be stronger than soul mages were historically considered to be, but there had to be limits to that. Historically speaking, a soul mage needed minutes of contact, but those were workmen soul mages, not an elite like Fallatehr. If he could affect someone through incidental touch, then we were already fucked, and had been back when Fenn put him into her glove, not to mention the fact that the teleportation key required direct contact. So we had already pinned our success on the idea that he wasn’t possessed of godlike power. Now, “that shouldn’t be possible” wasn’t exactly the more reassuring line of thinking, especially when dealing with unknowns, but that was what we had.

I went looking at other parts of my soul, trying to keep half my attention focused back on the real world. I had Amaryllis out there, and knew that she wouldn’t fuck around (whatever her other flaws), plus Ropey wrapped around my arm and actually keeping guard this time. I was still trying to go fast and look things over, rather than trying to learn about the soul itself, or look over any of the presented data too carefully. I briefly found what appeared to be social modelling, and checked in only long enough to see that Fallatehr was there and nothing about the tags and data fields looked too suspect, especially since none of them painted a flattering picture of him. There was nothing that I liked about him, and apparently his lisp mattered more to me than I was willing to admit, even though it made me cringe at how shallow I was.

Everything seemed to be in order though, or at least as in order as I had expected it to be. I wasn’t going to rush on making changes to my soul’s conception of my body, nor my values, because that seemed like exactly the sort of thing that might hide a technical trap that would make things worse for me. I didn’t trust Fallatehr not to screw me over like that, given that it was in his interests to make himself indispensable, and having me screw up was probably his fastest way to get access to my soul.

So with that, I followed the thread to Amaryllis, to see what her soul had in store.

Her skills were more general than I had thought they would be, though not quite so generalized as my own. I was mildly surprised to find that she had skills, since the soul seemed perfectly capable of including skills outside of the organized system that my own soul had. She didn’t seem to have the same limits as I did, since there were more than forty skills with explicit values attached to them, which raised questions for another day. I had so many questions; if the soul could mark down a prototypical defensive maneuver with a sword, why even attach numbers to it? There was this entire system that the game level seemed to have been slapped on top of just for the sake of being more like
a game.

I tore myself away from the skills before I could get too wrapped up in looking them over, moving on to her values, which I still thought were the most likely place I would see an alteration. It was also the place I thought would sate my curiosity.

Sorted by weighting, “Amaryllis” was at the top of her own list of values, and in second was “Autonomy”, then “Power”, then “Life”, and it wasn’t until I got to the tenth on the list that I found something that wasn’t either personal or abstract (or both): I was there, as number 10. I wasn’t quite sure how to take the list of values, given that they had different variables attached to them which I assumed altered how they were processed; my actual, experienced values only vaguely aligned with the list I’d been shown. I was hoping that it was the same for Amaryllis, and that what I was looking at was some redundancy within the systemization of concepts. At any rate, I checked for Fallatehr on there, and saw that he had a negative value, which to me was sufficient proof against tampering.

I hadn’t felt anyone touch me, and I still felt confident that I could pull myself out, so I moved back down the line to my own soul, and then up towards where Fenn’s soul awaited me, separated by thousands of miles though we were.

I was surprised to see the scars on her arms, along with the thin one that ran across her body from the bisection, but they made sense, because magical healing hadn’t wiped them away. I moved away from her body quickly though, not because I was embarrassed or ashamed of my reaction toward seeing her, but because I wanted to make sure that she was okay in the ways that mattered more to me. I missed her, and wanted to spend some time alone. We hadn’t had enough of a chance to talk since coming to the prison, and though it had only been a day, it felt like longer.

Her skills were more narrowly focused, but I didn’t look at them for long except to boggle at the fact that her Bows skill was in the low 50s, and to see a general pattern of specialization that either implied a weird stat distribution for her abilities or something else entirely. The few things that she was good at, she was really good at, but it seemed to go contrary to the design principles that ensured lower values due to multiple ability dependence. That wasn’t the purpose of my visit though. I was trying to make sure that she hadn’t been touched by Fallatehr or his cronies, that nothing had been obviously altered, and that we’d been, at worst, subtly altered.

Her values seemed to be the place to go for that, and I looked at them with a little more trepidation than I’d looked at Amaryllis’.

Where Amaryllis had a large number of abstract or high-level values, at least by naive weighting, Fenn’s looked more like my own, focused on the people close to me rather than on concepts. She was at the top of her own list, which seemed sensible enough to me -- between the three of us, I was the odd one out on that count, as I valued myself less -- and after that was “Nellan”, then “Juniper”, then “Amaryllis”, “Solace”, “Grak”, and “Six-Eyed Doe” (but who the fuck was Nellan?). I reordered the list to bring up Fallatehr, whose value was listed as not just negative, but at such a high negative number that I was almost alarmed by it. If I was reading the collection of values right, there were a number of things that Fenn would have given up in order to kill him.

I reordered the list, this time sorting from low to high, and saw a field of names, the majority of them typical of the elven names I had encountered thus far. I grimaced at that. Her companion quest was to go to the Isle of Eversummer, and my best guess was that it wasn’t going to end nicely for them. What I was seeing was just confirmation of that, but it was unpleasant nonetheless, because even if Aerbian elves were universally assholes, a part of me rebelled against the idea of slaughtering a village.

I felt a tap on my shoulder and instantly dropped out of my view of her soul, extending my sword
from bladed ring into full-fledged sword in an instant.

“Time to go,” said Amaryllis.

“Ropey?” I asked the length of rope that was wrapped around my arm. “Anything I need to worry about?”

One end of him curled up toward me and made a loop that shook from side to side. I looked around me, toward Fallatehr, then Valencia, then Grak, all in the positions that I had left them in, then back to Amaryllis.

“I hate this,” I said.

“It’s necessary,” said Amaryllis. “Demons and devils, a close friend we can no longer trust, and a man who would tear apart our souls in an instant. They’re not the best bedfellows. As soon as I’ve gotten some sleep, I might try to renegotiate with Fallatehr. If we can jettison Rehta and Lehpenn, we might be in a better position.” She hesitated. “Was there anything in my soul that we need to talk about?”

“No,” I replied. “Nothing that I saw, anyway. You were just about what I expected.”

“Alright,” said Amaryllis with a frown. “Good,” but I got the distinct impression that she had been hoping for a different answer. Before I could ask she turned aside and called over to Grak, then to Fallatehr, and whatever it was she had been concerned about, I decided that it was a thread that I could pull on later, when we were both in better condition, or I could simply search through her soul until I stumbled upon whatever it was she thought I would find there.

With some deliberation about positioning, Valencia returned to manacles, and a good deal of wariness on our part, we left for Parsmont, the City of Equal Standing.
As soon as the pain of the teleportation faded, and I had made sure that we were all clear of Fallatehr, Fenn came up and wrapped me in a hug. I returned it, trying my best to keep aware of my surroundings at the same time. Teleportation was both painful and disorientating, which meant that it was the best time for an ambush.

It was still dark near Parsmont (naturally, since Aerb didn’t have timezones) but clouds obscured the multicolored stars and Celestar, meaning that our only light was from a lantern that Fenn had set down on the grass. Behind her was a large farmhouse that wouldn’t have been out of place anywhere in the Midwest, with two stories, wood siding, and a wide, wrap around porch. Behind it was a tall barn with a fifteen-foot tall arch leading into the interior. Amaryllis hadn’t been kidding when she said that this place didn’t have much in the way of neighbors. I had to wonder how we had acquired it, though “lots and lots of money hastily exchanging hands” was probably a good guess. Hopefully that wasn’t going to attract attention, especially since we couldn’t move very quickly with eight people.

And in the other direction, there was Parsmont, the titular ‘mont’ really more of a large hill. It was coated with buildings, visible mostly by the streetlights laced through them. I didn’t have a firm grasp on the time, since I didn’t have a watch, but it was after midnight, and probably by a wide margin. There were cars and trucks moving through the city though, visible by their headlights, even at this late hour. It all looked so like Earth in so many ways that it felt like I had gone to a different world again, at least until I looked down at the half-elf in my arms.

“Still alive?” Fenn asked, backing up just enough so that she could bring a hand up to the side of my face and stare in my eyes. “Still Juniper?”

“You know that you can’t actually get an answer to that question, don’t you?” I asked. “My answer would be the same either way. I mean, obviously I’m still alive, but I would just lie about being me.”

“Yup, still Juniper,” said Fenn, as she gave me a quick kiss on the lips.

“You know that’s not enough, right?” I asked.

She rolled her eyes and smiled at me. “Come on, we’ve got a room.”

“Grak is compromised,” said Amaryllis, her tone hard.

“Under suspicion,” Grak corrected her. “They can’t tell one way or another.”

“Okay,” said Fenn, looking between the five of us. “Meaning?” She slowly drew a finger across her throat, raising an eyebrow.

“The plan is not to kill me, no,” said Grak with a slight snort.

“Well, good,” said Fenn. “Not that I would, you understand.”

“You’d make Mary do it,” said Grak with a slight, wide-toothed grin.

“I would make Mary do it,” Fenn agreed. “Come, let me give you a tour.”

She moved toward the farmhouse, pulling me along. Only a single room of the farmhouse was lit, the front living room, and when we came into it, she waved with a hand. “Home sweet home, for the
time being,” said Fenn. “Did you know that if you offer absurd amounts of money to people, they’ll let you stay in their house?”

“That worries me,” I said.

“It worries Mary too,” said Fenn with a shrug. “There were two of them, a little old lady and a nearly decrepit old man, went to go stay with their son down the road a bit, took all the sentimentals they could carry. We have a half now, half later agreement with them, for a fuckload of money by anyone’s standards, but it’s still kind of touchy. Mary still favored this over trying to go into town this late at night and risking more eyeballs in our direction.”

I looked around at the pictures on the walls, the knick-knacks, dried flowers in artful arrangements, and hunting trophies stuffed and put up on the wall, most of which were of species I didn’t recognize. Doors led off into other rooms, but I had been in enough houses like this that I wasn’t terribly interested in what it held. My eyes briefly caught on something that looked like a small shrine, but whatever had been sitting there, it was now noticeably absent, an empty space surrounded by dried flowers and a few unlit candles.

“Did we pick this place at random?” I asked.

“We went down the road a bit, looking at signs, until we found a few that had the same last name. We figured that gave us a better chance of not inconveniencing them too much,” said Fenn. “Out of the way, but close enough to Parsmont proper, where we’re headed in the morning to restock. We paid those people basically the full price of their house for the pleasure. But we should be safe here, at least for a little while.”

The rest of the group came to join us, Valencia first, then Grak, then Fallatehr, and finally Amaryllis following them at some distance.

“Fallatehr and Valencia will stay in the barn tonight, where Rehta and Lehpenn already are,” said Amaryllis. “Grak will stay with us in the house.”

“You cannot continue to treat me like a live grenade,” said Fallatehr, smiling softly. “It is a poor way to build a working relationship.”

“It’s just temporary,” said Amaryllis. “We’re already allowing for the possibility that you might leave. We know that you cannot be forced to teach under duress.” It was curiosity that had gotten him to agree to come with us, that was (probably) true, but I still felt a little ill at the idea that he might leave, and that we’d have inflicted him on the world. It was really a matter of practicality, because we didn’t have the manpower, facilities, or equipment to guard him and his clones, except possibly in the very short term. We might have been able to, if we knew for sure that we had Grak, but we didn’t have Grak. I knew all that, but it still made my stomach flip. “You might understand that our nerves are somewhat frayed by the amount of pain and effort we took in getting you out of prison.”

“I will not thank you for my rescue,” said Fallatehr. “Too many of my long-term projects were lost in the process, and the wider world has always been of little concern to me. Our interests are aligned, for the time being, but I won’t pretend at owing you anything in gratitude.”

Fenn rolled her eyes at that, but didn’t say anything in response.

“We’ll be a little more settled tomorrow,” said Amaryllis. “We’ll make a trip into town and figure out a more permanent housing situation so that Juniper’s training can continue, and once he’s built up some skill with soul magic, we won’t have to worry so much about the trust issues.”
Fallatehr nodded at that. I wondered whether that was giving the game away too much, but maybe Amaryllis was counting on Fallatehr to have already figured that out. Once I had a better working knowledge of soul magic, I could both ensure that my soul was defended, and defend against changes to the souls of others -- in theory, at least. His window of opportunity was shrinking, and he presumably didn’t know about the soul link between the three of us.

“We’ll all get some rest,” Fallatehr said with a short bow. He reached over and grabbed Valencia by the chains between her manacles, but she jerked away from him.

“I lied!” she shouted. Fallatehr managed to grab the chain, holding her in place. “I lied, he did touch Grak, he pinned him and touched his soul until he stopped moving, and then they talked to each other, Juniper, I’m sorry, but I lied, you have to be careful!” The words came out in a rush, breaths taken without ending a sentence.

“Believe what you wish,” said Fallatehr with a shrug. “It did not happen as she says, but such an outburst is not uncharacteristic of a possession.”

“Take her away,” said Amaryllis with a sigh.

“You have to believe me, Juniper, please!” said Valencia.

“Is there anything we could do to verify?” I asked. “Details that you couldn’t have known unless this was the truth?”

“No,” said Valencia, saying the word like I had stabbed her.

I gave her a small nod as Fallatehr led her away, out of the door, staring at me with wide eyes but unresisting.

“It’s meaningless,” said Amaryllis. “Nothing we can verify, nothing that we can act on, nothing new, and as likely to be the result of possession as what she initially told us.”

“It’s not true,” said Grak. “For whatever me saying that is worth.”

“The girl seems taken with you,” Fenn said to me, giving me a fake smile and a nudge in the ribs.

“Juniper doesn’t share our cultural values,” said Amaryllis, shaking her head slightly. She blinked slowly. “I need sleep, at least a little bit, before we do a full debrief.” She turned to Grak. “Unfortunately, we’re going to have to leave you out of those conversations.”

Grak frowned at that. “If my soul were touched, he would already know everything I know,” said Grak.

“Yes,” said Amaryllis. “But you don’t know everything that we know, not yet.”

Grak frowned again. “I agree with a need for caution. There must be limits though. I cannot be exiled from decision-making and information-sharing forever.”

“You’re too important to keep you out of the loop forever,” said Amaryllis. “But we are waiting on Juniper to have whatever level of skill is necessary to ensure that you’re still the Grak we know.”

“And love,” added Fenn.

“But for now, you’ll be sleeping in another room,” said Amaryllis. “Juniper will close you in with a Lecher’s Vine.”
“Let me put up wards,” said Grak. “Treat them as untrustworthy. I will at least gain peace of mind.”

Amaryllis rubbed her eyes. “No,” she said. “If you were working against us you could turn this place into a death trap and put us at a disadvantage in the event of an attack. Down that hall there, to the right, please.”

“Fair enough,” nodded Grak, looking quickly between the three of us before heading off down the hallway. I followed after him.

“Sorry about all this,” I said once he was in the small bedroom. I’d been expecting quilts, like my grandparents made, but the bedding was clearly some mass produced, perfectly-machined fabric. There were pictures of someone’s family on the wall, and an old dresser that looked like it had been carved from a single, solid, piece of wood. The bed was too high for Grak to comfortably get up on, and I immediately felt bad for him. “If,” I began, then stopped, because Grak didn’t know about the soul link, and I couldn’t tell him. “I’ll figure out a way to check your soul over.”

“I’m not comfortable with that,” said Grak, folding his arms across his chest.

“Meaning that you would refuse?” I asked.

“No,” he replied. “It is possible to submit to something uncomfortable.”

“We should try it now,” I said, holding out my hand to him. He hesitated, then took his hand in my own. My Essentialism was up to 7 now, just from poking around, but I had no real idea how I was supposed to be able to access another person's soul. I tried a few ways to conceptualize it, as though I was following a thread like I did for Fenn and Amaryllis, or like I was opening the book of Grakhuil, but nothing worked, and after what felt like an eternity holding his hand in the doorway, I pulled away.

“Sorry,” I said, shaking my head. “Thank you for being good about it, even if it’s just a plot that Fallatehr told you to follow.” I meant that as a joke, but it didn’t come out like one, and Grak didn’t show any signs of even mild amusement.

There were no windows in his room, which was a plus, because that meant just one of my Lecher’s Vines was needed to make sure that I would know if he left. I stared at the door for a bit, trying to erase an unpleasant but true thought. At least it was him and not Fenn or Amaryllis. Maybe there was a good reason that he wasn’t loyal to me.

“Personally, I think it’s great to be sharing a bedroom again,” said Fenn as Amaryllis stripped out of her immobility plate. We were going to share the master bedroom on the second floor, which had an adjoining bathroom, and more importantly, would be pretty easy to defend against intrusion. “Brings me back to the good old days, when we were three peas in a pod in Barren Jewel.”

“I’m going to take a very quick shower to wash the sweat and blood off,” said Amaryllis. “Then I’m going to sleep.”

I had already secured the door with another Lecher’s Vine, which had crawled from my skin and went to surround the door frame in bright green leaves, then moved a heavy dresser in front of it. In the event we had to leave in a hurry, we’d be using a window. I averted my eyes as Amaryllis took off the last of the plate and stripped down her underclothes to full nudity. I waited until she had closed herself in the bathroom to sit down on the bed with Fenn. She kissed me on the neck, then rested her head on my shoulder before deciding better of it and flopping down on top of the blankets. The cloak of leaves she’d inherited from Solace was carefully set beside her.
“Hell of a day,” she said.

I laid down beside her. I needed a shower of my own before going to sleep. “Yeah,” I said.

“Let’s never voluntarily go somewhere that makes me so useless,” said Fenn. “Do you ever have that dream where you’re punching someone, but it feels like your fists are hitting mud?”

“I’m pretty sure it’s universal,” I said. “Your brain’s not getting feedback from the nerve endings, so it invents an interpretation that fits the data.”

“Well that’s how I felt all day,” said Fenn. “Just shooting those things with arrows over and over, not doing shit to them.” She rolled toward me and gave me a kiss. “You need a shower too, especially if we’re sharing a bed.”

“Fair enough,” I said, looking up at the ceiling. “I think we should kill Fallatehr.”

“You have soul magic unlocked?” asked Fenn.

“Yeah,” I said, breathing a sigh. “There’s certainly more he could teach me, and I’ve already run into a few things that worry me, but … he’s dangerous. I’m not even sure that we should be letting him out of our sight.” Our original plan hadn’t looked like this, but the problem with needing someone for their intellectual labor was that you couldn’t just hold them at gunpoint, not if you didn’t have someone to replace them.

“He’s a deviant,” said Fenn. “Not sure how much you cottoned on to that.”

“Yeah, he’s a mad scientist,” I said. “That was pretty obvious.”

“No,” said Fenn. “I mean, as far as elves go, he’s … he’s flagrantly imperfect, he’s not even trying. Science is trial and error, that’s anathema to an elf. He speaks with a lisp, no sane elf would do that. The culture of elves, no matter the flavor, is all about perfection, I -- I don’t know if I can do justice to how fundamentally wrong he is.”

“Ah,” I said. “Well he’s the first elf I’ve really met.” I paused slightly. “I’m going to need to read that entry in The Book of Blood sometime soon. I probably should have insisted.”

Fenn sat up slightly and looked me over. “So you didn’t actually read it?” she asked.

I shook my head, furrowing my brow. “You said that you didn’t want me to.”

“And that’s why you didn’t know about the teeth,” said Fenn.

“I’m glad that didn’t screw anything up for us,” I said. “It also seems like the sort of thing that the book would mention.”

“Huh,” said Fenn. “I’d sort of assumed that you -- when we were together, how did you know?” I raised an eyebrow. She blushed slightly. “How did you, ah, know your way around?”

“Wait, you think that I cheated by reading that book?” I asked.

“Well I don’t know,” said Fenn. “Yes, I guess that is what I thought. I wasn’t about to complain about it, given the results, but,” she stopped mid-sentence, looking me in the eyes. “It didn’t really occur to me that you hadn’t violated that agreement. I knew you were curious, and it was a minor thing, so I just sort of,” she shrugged, still watching me.

“So you’re saying that I’m a better man than you thought I was?” I asked.
Fenn nodded. “You’re not mad at me? We’re not going to have a big dumb fight about this?”

I shook my head. I could see it happening, maybe, in some other universe, but I’d betrayed trust enough times in my life that I wasn’t about to get upset about someone assuming I’d done wrong. Fenn leaned down and kissed me on the lips.

**Loyalty increased: Fenn lvl 20!**

**Companion Passive Unlocked: Symbiosis (Fenn)!**

“Wait,” I said, placing a hand on her chest and gently pushing her away. “Game stuff,” I explained as I closed my eyes.

**Symbiosis:** You and Fenn are connected on a deeper level now, with the last vestiges of reluctance stripped away. When together, you may both use either your own skill, or half the skill of the other, rounded down, whichever is higher.

“What kind of game stuff?” asked Fenn. I opened my eyes and looked at her. “Loyalty 20?”

“Yeah,” I said. “I think we both just got better at … a lot of stuff, actually. You might know some magic.” So long as I was with her, the ungestalted Lying and Stealth were both practically useless to me, since I could just bum off her. My optimal build, which I hadn't even worked out yet, had shifted again with this new passive. “Oh, and I can see your character sheet now, or something close to it.”

“And you didn’t lead with that?” she asked. “Here, let me get you a pen and paper, you need to write it all down.”

“Later,” came a voice from the doorway. Amaryllis was toweling herself dry, and I averted my eyes again. “Full debrief when I’m awake enough for it. Fenn, you have my clothes.”

“I do, don’t I,” said Fenn with a vulpine smile.

“Fine, I’m going to bed,” said Amaryllis. “Joon, take a bedroll or get over yourself, I don’t care which. With the vines in place, a barricade, and the rope keeping watch, I’m prepared to risk going without a guard. The threat from Fallatehr is going to be more subtle.” With that she slipped under the covers and cast the sleeping spell over her forehead, putting her out like a light.

(That was the first spell I had ever seen, aside from maybe the slow-fall tattoo, depending on how it counted, way back when we’d been camping out in a farmhouse in the Risen Lands. It was one of the very few spells that were universal and without a school. It had no unintended applications that I could find, and Amaryllis had looked at me like I was an idiot for suggesting it could be exploitable. It didn’t work unless you actually wanted to get to sleep, and you couldn’t even fake it by consenting to the spell.)

“She’s been trying to match you,” said Fenn, nodding toward Amaryllis.

“She was doing a good job of it,” I replied.

“You’ve got her beat in physical strength, reach, and by the way our sparring has gone, training too,” said Fenn. “She has the better sword, I think, but the real thing closing the gap is how much effort she’s been putting in.”

“Ah,” I said.

“I just wanted to let you know, because I know that social skills aren’t really your thing at the
moment,” said Fenn.

I wanted to say that they weren’t that bad, but I hadn’t realized that Amaryllis was pushing herself that hard, nor that it might be because she was trying to match me. I didn’t necessarily know whether Fenn was right, but the hypothesis hadn’t even crossed my mind. “Thanks,” I said.

“Do you want company for your shower?” she asked, looking at my lips for a moment before kissing them. “I was thinking that it might be good to work out some of my frustrations over how the day has gone.”

“I’m pretty sure I’m rancid under this armor,” I said. “But you would help me get clean?”

Fenn gave me an eager nod.

“You don’t get to just know the mechanics,” I said. “That strips back everything interesting.”

“It shouldn’t,” said Arthur, frowning at me. “Yes, it reduces the mystery, but most of what’s interesting about this place isn’t in how the rules work, it’s in seeing what impacts those rules have on the world.”

“Besides that,” said Craig, “Presumably everyone in Parsmont is aware of the rules, they should know those rules backward and forward, so we can just talk to a fishmonger or something.”

“Fishmonger?” I asked. “That’s the most random -- there aren’t any fishmongers, it’s a city on a hill, at best there are some river fish, but it’s a place of meats and grains.”

“So fish are only for the hoi polloi?” asked Tom.

“No ‘the’,” said Arthur. “‘Hoi’ already means ‘the’. And ‘hoi polloi’ means masses, which -- Joon, are the fish a high class or low class food? I can see the argument either way, the fish are river fish and a food of convenience for those who live near the rivers, but they’re also in limited supply, which suggests that they’d be valuable, assuming that they weren’t all fished out. Happened a lot historically, commoner’s food making the jump to fine dining.”

“I just want rules, dammit,” said Reimer.

“I mean I’m pretty sure that we just agreed we’re going to find a fishmonger,” said Tom, with a small grin.

“No, veto,” said Reimer. “I know I don’t have veto power, but veto.”

“Do we find a fishmonger?” asked Arthur, looking to me with a smile.

“I ... “ I looked down at my notes for Parsmont, then over to the table of randomly generated names I used for times like this. “You eventually find Homeleron, a Kandrian merchant who sells some of the river fish brought in to him from the Pelleomance. Kandria is on the sea, and Homeleron is the guy that all the Kandrians go to when they get a little bit homesick and want to make one of their traditional dishes, albeit with some substitutions. You think that he’s probably a well-connected man.” That was a load of frantic bullshittery, and I was hoping that no one would call me on the fact that I had just said that there weren’t any fishmongers in Parsmont.

“Greetings, Homeleron,” said Arthur, “You seem like a man who knows a thing or two.”
“That I might be,” I said with a laugh. I didn’t tend to change my voice much in-game, if only because I never knew how long a character was going to stick around, and some of the more extreme voices I’d tried in front of a mirror were really hard to hold. I had a picture of Homeleron in my head almost immediately, and let some of that creep into my speech; he was uneducated but knew a lot, a man with many connections and maybe more self-importance than was warranted. A poor man, I decided, but only poor in the sense that he had his small stall and few possessions, not the kind of poor where he was scrambling to make rent or hurting from taxes.

“I’d like a list of mechanics,” said Reimer. “I have pen and paper, and want you to write down everything you know about the workings of the orb at the center of Parsmont and the abilities that it gives to the people within it. I’ll pay you … ten gold.”

“His eyes light up at that,” I replied, inwardly groaning. “Well, I’m not sure I know my letters so well, but I can tell you whatever you’d want, he says.”

“Everyone has a vote, right?” asked Arthur. “What does it take for us to vote?”

“Well you can feel it, can’t you?” I asked, as Homeleron, playing the part of someone who was pretending to be shocked by their ignorance. “At the back of your head, the votes sitting there?”

“I touch the back of my head, cautiously,” said Arthur.

I gave Homeleron a belly-laugh. “No, in your head, like you’re looking backward without using your eyes.”

“Okay, I do that,” said Reimer. “Seems like the sort of thing that you would immediately realize was there if you had 18 Wis.”

“You see two indents in your mind’s eye, one with a hundred gleaming jewels, the other empty, but with room for far more,” I said.

“I move the jewels from one indent to the other,” said Craig.

“You die, instantly,” said Reimer.

“No, you don’t die,” I said with a sigh. “Nothing happens, you can’t do it.”

“Okay, then I try to transfer my jewels -- a single one of my jewels, actually -- to a theoretical receiving indent in Berberous’ head,” said Arthur.

“Berberous,” I said, turning to Craig. “You see a single jewel appear in the empty indent.”

“Do I feel any different?” aske Craig.

“No, not especially,” I replied. I turned to Arthur. “You have a slight feeling of connection to that jewel still, like you could pull it back if you wanted to.”

“I do so,” replied Arthur with a slight frown.

“So whoever gets the most jewels gets to be a badass, but people can take their jewels back at any time?” asked Reimer. “Meaning that all power in Parsmont is transitory.”

“Are you asking me, or Homelaran?” I asked.

“Homeleron?” asked Arthur.
“Right, Homeleron,” I said. I had already forgotten his biographical details, and tried to recreate them from scratch. He was a fishmonger, world-weary, selling goods that had been carted in from too far away, losing their freshness in the process. It wasn’t what I’d decided before, but none of that had been exposed to the players anyway.

“Sure, I’ll ask him what the power structure looks like,” said Reimer.

“Oh, people come and people go,” I said as Homeleron. “But less than you’d think, because the people up top fight each other, and not too many want to put themselves in that fight, so it’s mostly about putting your vote behind the guy you think has the best chance of fighting against the guy you hate.”

“And they literally fight each other?” asked Reimer. “With as-yet-unspecifed powers?”

“Once in a blue moon,” I replied.

“Two point seven years,” answered Reimer.

“That’s …” I started, then stopped. “More often, they pursue their own goals, and try to keep people happy enough that they retain the vote.”

“That’s Homeleron saying that?” asked Arthur.

“No, it’s me,” I said. “Look, is anyone going to buy any fish?”

“All I want is for you to stop teasing and just be explicit,” said Reimer. “That’s not so much to ask. We’ve got the fluff out of the way, right?”

“And now you want some crunch,” I said with a sigh. The night didn’t seem like it was going my way, for reasons that I couldn’t quite put my finger on. Sometimes a session just got away from me. “Okay, a thousand jewels gives you a +1 bonus to skills, stackable up to +10, two thousand gives you a bonus of +1 to AC, stackable up to +10,” and this continued on for a bit, as I read through the things on my list. At the highest levels, with a million people pledging their full support, an NPC didn’t quite become epic level, but that was the only restraint I’d shown.

“Well how are we going to beat those guys then?” asked Craig. “Poison?”

“The answer is always poison,” said Arthur with a nod.

“Except not, because D&D poison is awful,” said Reimer. “And I doubt that Joon is going to let us get away with homebrew again.”

“You all understand that your goal is not to come into every town and murder the people in charge, right?” I asked. “Please, someone tell me that you know that. You have a quest.”

“Yeah, we’re here to get a MacGuffin,” said Craig. He paused slightly. “So what I’m thinking is, we bus people in and get their votes.”

And if we’d been teetering on the brink before, that was when the session went off the deep end.

I woke up at what felt like fuck o’clock in the morning, with the sky a pale color that suggested the sun hadn’t finished cresting the hill. I blinked twice and looked around, coming to my senses slower than I would have liked, with my Anyblade in hand, looking for the threat. The dresser was still in front of the door, and the vine was still wrapped around the frame, healthy and green.
“I was going to let you sleep a bit,” said Amaryllis, her voice low. She was half-dressed in plate; Fenn had left out a change of underclothes for her, a concession in the direction of practicality. The greaves and boots were on, but the upper sections were still on the floor, leaving her staring at me in the cold half-light with just her tank top on.

“I still might,” I said, looking over at Fenn, still sleeping beside me. “You’re up early. Thought you needed sleep.”

“I got sleep,” said Amaryllis. I could see that she still wasn’t at peak condition though, with bags under her eyes. “We need to stabilize.”

“In what sense?” I asked. Ropey was sitting on the bed, coiled with one end lifted slightly, and I put my hand out to him. “Clear?” I asked him. He nodded, and I relaxed a fraction.

“You want more training with Fallatehr, to make sure that you don’t make some grave error,” said Amaryllis. “That’s of questionable value, given that he might misinform you.”

“I know,” I said. “I’d have fixed my hand already if I actually trusted him. It’s not really about the training, in the literal sense, it’s about using him to get past the skill cap of 20.”

“We need to figure out a way to make this work,” said Amaryllis. “All of it, the big picture. Not just soul training, we need to stop lurching from one encounter to the next.”

“I’m not sure that downtime is going to be likely, given our circumstances,” I said. The Dungeon Master probably doesn’t want us to have it, and once one Sword of Damocles has been lifted, another will take its place. Wait, that’s a bad metaphor, the Sword of Damocles was an ever-present danger, so the narrative forces, or the Dungeon Master himself, is the Sword, and the presentation of that sword is all that will change.

“I’m not talking about downtime,” said Amaryllis. “We’re in a pattern of reaction right now, we have been since I was taken by Aumann. You had the crisis of needing to save me, then the crisis of needing to cure me, then the crisis of needing to cure your own ailment, and now we have the crisis of Fallatehr, not to mention trying our best to save the locus. We need to break out of the cycles of crisis. We need to chart a path forward of our own accord.”

“Ah,” I replied. “That’s kind of hard to do when we’re still putting out fires.”

“I agree,” said Amaryllis. “The problem is that the fires multiply. They’re what I’m worried about, when I talk about stability. We need to keep our fires contained. Episodic.”

“The n-word,” I said with a grimace. “I’m not sure how we can do that.”

“We came to Parsmont because they’re welcoming to visitors and somewhat dissociated from the Empire of Common Cause,” said Amaryllis. “We did not come here to have any interaction with their system of governance. We’re not trying to shake things up, we’re not trying to solve problems, we’re just here because it’s a relatively safe place. We can’t afford to get sucked into anything.”

“I know all that,” I said, trying to be gentle. “I’m just worried that we’re going to get sucked in by … something.”

“Forward motion,” said Amaryllis as she put on the breastplate. “I think part of the problem is that we haven’t been committing to the quests.”

“From a narrativist perspective?” I asked. I really didn’t want to operate with narrative in mind, and that wasn’t just because I thought it was likely to get us pushback from the Dungeon Master.
“Either way,” said Amaryllis with a shrug.

“I’ll keep it in mind,” I said. “Parsmont probably has something for us, but I don’t think we’re obligated to take up every quest that’s on offer. The Risen Bile back in Barren Jewel turned out to be set-dressing, and in retrospect, there was probably a quest in there.”

“They attacked us,” said Amaryllis.

“Well, yes,” I said. “But after that, hunkering down worked. Whatever we run across, we’ll try to employ the same strategy while we deal with Fallatehr.”

“Assuming he’s still there,” said Amaryllis, putting the last of her armor in place. “If he’s run away in the middle of the night … at least you unlocked soul magic, and given that he would be willing to abandon us, he wouldn’t teach you anyway, so I suppose that’s not as bad an outcome.”

“Sounds like sour grapes to me,” I replied.

“Sour grapes?” asked Amaryllis with a raised eyebrow. She was fully armored now, with her helmet in hand, looking every inch the warrior. There was something more beautiful about her this way, more terrifying, but more in tune with who she was as a person. I could imagine that when she was in her forties, people would remark that they couldn’t imagine that she had ever been a teenage girl. It wasn’t that she looked old, really, just that she was more hardened than anyone my own age should be.

“Do you not have Aesop’s fables?” I asked. “There’s this fox, and he can’t reach some grapes, so he says, ‘eh, they were probably sour anyway’?”

“You think that I’m practicing self-deception,” said Amaryllis, brows knitted slightly as she focused on me with a trace of a frown on her lips.

I had really just been talking without thinking that much about what I was saying, but that word, ‘self-deception’ made my mind jump tracks, and the memory of her telling me that she had tried to love me came, unbidden, to the forefront of my mind. I wasn’t sure that’s what she was thinking, but I was momentarily stunned by the thought that maybe she was.

“We’ll see soon enough whether he’s stayed,” Amaryllis continued, shrugging off that line of thinking. The thought that he might not have stayed still made me queasy. “The only reason to think that he left is base pessimism.”

“And we’re okay with unleashing him on the world?” I asked.

“Soul magic is less powerful than it was during the height of the Second Empire,” said Amaryllis. “There are exclusions applied to it, pieces of it that no longer work. He’s far from harmless, but then again, he wasn’t ever a predator, at least from what I can tell. The bigger issue is how he might impact us on the world stage.”

“Assuming that we get there,” I replied.

We debriefed, once we’d woken Fenn up. She put on her clothes, grumbling the whole while, as she listened to us talk.

“You took Tree Magic without knowing what it did?” asked Amaryllis. She had her notes out and was making marks on her paper version of my character sheet.
“There’s a whole lot of magic that’s excluded,” I said. “Tree Magic and Library Magic are two of the only ones that aren’t recognized schools of magic, which means that they’re either important or powerful, maybe both. Same with Spirit, though maybe that’s not a proper magic.”

“You shouldn’t have taken three kinds of armor,” said Amaryllis, looking down at the sheet. “Unarmored and Heavy armor are defensible choices, given that you can’t always walk around in armor, but—”

“This isn’t the time to second-guess every decision I’ve made,” I said, again looking out the window to the barn. There was no sign of Fallatehr yet, but it was still early in the morning, just after sunrise. We hadn’t gone to get Grak yet; the things we were talking about weren’t for his ears. “I was thinking that I didn’t really know what counted as light, medium, or heavy armor, and as far as armor goes I’m currently constrained by our access to magic items, so it made sense to hedge my bets there, since survivability is really important in an Iron Man run … I’m assuming.”

“And you dropped Art,” said Amaryllis. “Art that you need in order to inscribe new tattoos.”

“Is this your last objection?” I asked. Amaryllis shifted around, looking down at the papers. “It’s all been done, there’s no point in chiding me for it, or making me explain myself.”

“Of course there is,” said Amaryllis. “If you make a mistake, you have to understand that mistake so that you don’t make it in the future.”

“I’m going to have more time, next time I choose skills,” I said. “I’ll be going in with a plan. Do you think that locking myself into the existing skills for another four levels was a good idea? I had to choose, and choose quickly.”

**Skill unlocked: Debate!**

I smiled inwardly at that. When we had the time, we were going to have to level that up (though time was something we were short on).

“That only makes me question your ability to make decisions on the fly,” said Amaryllis, before adding. “No offense.”

“None taken,” I replied. I looked down at my malformed hand, the product of a different decision made on the fly. The results hadn’t been good, but there, at least, I was pretty sure that the result of inaction would have been death.

“So why’d you drop Art?” asked Fenn. She was standing next to the window, holding the bottle up to the light. We didn’t have Solace to make the miniature sun anymore, and keeping the bottle in darkness might mean that the temperature would drop, which would in turn mean that the things within it would die. We were going to have to find a solution to that in short order, or at least find a way in so that we could get some sense of what was going on, instead of just the bird’s eye view.

“The tattoos are useful, but I have a lot of them stocked up at the moment,” I said with a sigh. I couldn’t actually imagine what it would have been like to not tell them anything about my power, but there were times when I had a pang of longing for that alternate timeline. “And my Art was at 6, and not going up without investment into the relevant abilities. But beyond that, I have some level of ability in things that aren’t part of what the game layer considers to be my skills, so I was hoping that would be enough. It’s a fairly painless and concrete way to test what remains after a skill is off the roster.”

“And have you?” asked Amaryllis.
“I haven’t really had a chance,” I said.

“Looks like we’re going to wait a bit for that,” said Fenn, moving away from the window and slipping the bottle back into the cloak of leaves she’d inherited from Solace. “Unless art is a more pressing concern than our resident soul fucker stepping out from that building?”

“Let’s go get Grak,” said Amaryllis with a sigh. “Time to see whether we can make this arrangement work.”
Fallatehr and I took our second lesson together in the barn, mostly because it was the largest indoor space, with plenty of room around us and little chance for shenanigans. I had Ropey around me as a precaution, but I also had Amaryllis, Fenn, and Grak (for what he was worth), and we’d put quite a bit of space between Fallatehr and myself as well. Valencia was in the basement, manacled to a boiler there, while Fallatehr’s other two minions had grudgingly been given leave to go into town by Amaryllis.

“I wasn’t aware that I would be teaching so many,” said Fallatehr with a smile.

“Just me,” I said. “I should need less instruction than anyone else. I’d like for you to walk me through the process for fixing my hand, both from a theoretical standpoint and in terms of the process and risks associated with it.” I was in full armor, which was streaked with white where it had absorbed hits the day before. My Anyblade was in the shape of a dagger, held in my right hand.

“Tit for tat,” said Fallatehr. “Tell me about your intriguing capacity for learning. Was it acquired, or were you born with it?”

“I was born with it,” I said.

Skill increased: Lying lvl 2!

With Deception ungestalted, I had to level Lying and Stealth back up, but luckily, Fenn had Lying in the mid-30s, which meant that through Symbiosis I had Lying in the high teens so long as she was near me. What I’d said wasn’t really a lie either, depending on the definition of ‘born’. I was pretty sure that my soul had only existed from the moment that I appeared on the plane above the Risen Lands.

“And what domains does your talent apply to?” asked Fallatehr. “Only magic, or other areas as well?”

“It applies to specific domains, not all of which I’ve discovered,” I said. My skill at Lying went up again. It was technically true, given that a few of my skills were still mysteries to me. “Magic does appear to be one of the common threads though.”

Fallatehr nodded. “Can you perform feats that you should, by rights, not have known how to accomplish, or are you limited to only those that have been explained adequately to you?”

“That’s enough questions for now,” I replied. “Tell me about how bone magic intersects with soul magic.”

Fallatehr hesitated, watching me, then nodded to himself. “My question is not just to satisfy my own curiosity,” he said. “You did not train at the athenaeum, and your knowledge of bone magic might not comport with bone magic as it is taught there.”

“That’s true,” I admitted, shifting slightly in my seat. Most of what I knew about bone magic I had learned from The Commoner’s Guide to Bone Magic. “Yes, I have some level of knowledge granted to me that is outside the scope of what I was told or taught, and which I couldn’t have simply worked out from base principles.”

Fallatehr nodded. “So you are not indoctrinated into the dogma of the athenaeums,” he said. “That is likely for the best. In my time there was some contention between the Guild of the Essential Soul and
the Athenaeum of Bone and Flesh. They did not want to admit that their art was an extension of our own. Are you familiar with the concept of aspects?” I nodded. So far as I could tell, there was a one to one correspondence between bone-magic aspects and game-layer attributes. “They are a gesture in the direction of information written on the soul,” said Fallatehr. “Bone magic, at its heart, is nothing more than briefly adding someone’s soul to your own.”

“Uh,” I said. “There are a number of problems with that explanation, given what I know.”

“By your own accounting, I am the most knowledgeable soul mage left in the world,” said Fallatehr. “But please,” he added, grinning with sharp teeth, “Explain why I am wrong.”

I took a breath. I hated Socratic dialogues. “Most of the bones that bone mages use come from --”

“The term ‘soul’ is imprecise,” said Fallatehr. “You likely think of it as a small white thing pulled from the heart or head after death?” He gestured first at his temple, then at his chest. “That is the anima exa, a physical manifestation of the soul, unique to the mortal species, but not synonymous with the anima ipsa.”

“But the soul can be extinguished,” I said. “And as far as I can tell, that has no bearing on the bones themselves.”

“The anima exa can be extinguished,” said Fallatehr. “And in fact, nothing in the world can prevent that, so far as is known to me. That has little bearing on the anima ipsa.”

I frowned at that. “Naively, that doesn’t make sense. You’re saying that the soul continues to exist in the bones, regardless of whether someone goes to hell?”

“No,” said Fallatehr. “What I am saying is that by every method I have been able to use, the soul continues to be accessible well after death, even for those confirmed by infernoscope to have passed into the afterlife.”

I heard movement from behind me. “If that were true --” Amaryllis began.

“It is,” said Fallatehr.

“There would be metaphysical implications of that,” said Amaryllis. “If the souls of those in hell could be manipulated by means on Aerb we --”

“They cannot,” said Fallatehr.

“Why not?” asked Amaryllis.

“The principle of planar disjunction,” said Fallatehr. “It was the talk of the Guild of the Essential Soul, prior to the subjugation and death of ninety percent of its members when Manifest’s exclusion zone was created.” He seemed slightly wistful for a moment. “Obviously I had no ability to conduct novel research on planar disjunction from within Amoureux, and I was not allowed the courtesy of taking a copy of the relevant studies into the penitentiary, but all available evidence pointed to the fact that the soul was, in fact, incapable of crossing the planar boundary.” He waved his hand. “Much of this is tangential to the subject at hand.”

“Har har,” I said, raising my deformed hand slightly.

“We might think of the bones as intermediaries,” said Fallatehr. “If the soul is a complicated book of exceptional length, the bones are men who study that book and give answers to those who seek them. Each has a deep connection to the soul, and is conversant on its own area.”
“But when you burn a bone, you affect the soul,” I said. “So it wouldn’t seem like a very good metaphor to me.”

“Metaphors are rarely good,” said Fallatehr with a shrug. “We -- I say we, but there are by your accounting few left alive who might have given me a proper conversation on the subject -- don’t understand precisely what happens when bone magic is used. It appears to affect both donor and recipient at the level of the soul, with other effects as a result of that, but the actual mechanism is opaque, despite the numerous tests we’ve done.”

“Such as?” I asked.

Fallatehr gave me a grin. “I do not believe that you would appreciate such scientific pursuits,” he said. He was watching me, and I tried not to give anything away, but I had no clue whether I was successful or not. “I have given you enough, tell me more about your ability, and its working. Have the things that I’ve told you measurably improved your ability with soul magic?”

“No,” I said. I realized only too late that I should have waited before answering, or given a non-committal answer. A quick answer of no indicated that I had some indication of when my power was working, which was information that I hadn’t intended to leak. (But at least I realized that I had leaked it. There was something about Fallatehr that scared me, beyond what I knew of him, something that made me think that he was reading an enormous amount into everything I said and did, and I worried that I was giving things away without even knowing I had done it.)

“I really would like to see whether you are able to repair your hand,” said Fallatehr, leaning back slightly in his chair. “Does my saying that unnerve you so much that you would resist me?”

“No,” I said. If it was a trap, we would just kill him. The odds that my attempt to replace a single bone on my left hand would go so catastrophically that I would need to be rescued by him were very, very low, especially given how much he would have to be pinning on that moment. So long as I didn’t get lured into my own soul, or trapped there, neither of which seemed likely, we didn’t need him, and if either of those things happened, his help would be so untrustworthy that we’d be better off killing him. “I won’t ask you to describe the process, since that would defeat the purpose of your inquiry and I do want to have a working relationship with some level of --” quid pro quo, is that an expression on Aerb? “--tit for tat, but what are the risks to me, assuming that I do everything wrong?” I asked.

“Your hands are human, and not perfectly symmetrical,” said Fallatehr. He briefly ran a thin tongue along pointed teeth. “The soul is resilient, and should accommodate for what you will be attempting, but I am willing to admit that it may not, given that you will be using a supernaturally assisted version of the art. In that case, the worst that will happen is that you will lose the hand, but it won’t be something that can’t be fixed through proper soul magic.”

“Uh huh,” I said. Not going to happen. “No other points of failure?”

Fallatehr smiled at me. “Oh, if we’re speaking of possibilities, there are many,” he said. “You’re using a power -- unique?”

“Yes,” I said, before even realizing that was a lie. Arthur too.

“You’re using a unique power that only you possess to interface with the root of all magic,” said Fallatehr. “The possibilities are endless, given our mutual areas of ignorance. Perhaps you will attempt to copy over the pattern of a single bone and grab hold of the nerves of your hand instead, accidentally pulling them out and then finding yourself unable to put them back in. It is, I must admit, a possibility, as are many other such scenarios.”
“It would be fixable though,” I said.

“The soul has only a conception of the body,” said Fallatehr. “What is shown in the soul is not what the body is, but what the soul believes is the pattern the body should adhere to. Any damage you do, even removal of the body-conception entirely, could be remedied by a master.”

I frowned slightly at that. I could see his angles, and they weren’t working on me, which I was grateful for. “Amaryllis, Fenn, give me two hours, then if I’m not back out from inside my soul, try your best to wake me.”

I was getting familiar with my soul. It was, in some respects, just another interface, if one that was laid on top of some deeply personal and complicated mechanics. I had always been good at picking up new interfaces, maybe because video games gave me a lot of exposure to switching between them. I zoomed in on the body and then down to look at my right hand, the one that still had the bones in it.

What Fallatehr had said about making novel mistakes was on my mind as I looked through the layers of my body. It didn’t seem like I could accidentally pluck at the wrong thing, because it was possible to change the view so that only the bones were showing. It was all done with the mind, so I was cautious not to think in the direction of change, only observation. I tentatively zoomed closer to the end of my pinky finger, isolating the final bone there, the distal phalanx. I took a breath and then poked it with my mind.

My view changed slightly, showing ghosted images at the very tip of the finger where skin, nail, nerves, fingerprints, and capillaries were, all surrounding the bone itself. I didn’t want to move or change the bone, or do anything to the surrounding tissue, all I wanted was to copy it. There weren’t any options associated with it, and no apparent menus, but from what Fallatehr had said -- not that I trusted him -- it should be possible to copy it over. I directed my will toward that task, which finally caused a dialogue to appear.

Move / Copy / Modify / Delete

I stared at those options for a bit. Copy was obviously the one that I wanted, but the other three gave me a good guess at the actual failure states for the change I was trying to make. I didn’t know what Fallatehr saw when he looked into his own soul, but I didn’t imagine that it was this, and perhaps he was thinking that I would screw up in such a way that I would need his help; accidentally removing one of the bones from my finger, leaving me without a replacement, or making a modification that I couldn’t undo.

I selected the option to Copy with a thrust of my will, and felt something come into being just beyond my field of vision to the left. Shifting my focus there showed a bone, hovering slightly in the air. I turned back to the skeletal form of my hand, then zoomed out the view and went over to my left hand, where the bones were missing. I looked over to my left, where the bone was, and with a push of will got the same four options again. This time I moved it, using my mind alone, until I had slotted it into place. Another dialog box appeared.

Merge / Conform / Replace / Cancel

I started at that for a moment, trying to work out what those commands meant. The bone still needed to be mirrored, but even then it probably wasn’t going to be correct, because the two halves of my body weren’t exactly the same, just as Fallatehr had said. The options, unfortunately, weren’t terribly descriptive, aside from Cancel. I took a steadying breath, reflexive action that became a startling reminder that I still had a body out there in the real world. I could back out of my soul now and
simply ask Fallatehr, but I didn’t want to give anything away to him if I could help it.

It was just one bone, the tip of my pinky, the least important part of me. And if I picked the wrong one, it seemed likely that I could try again, since my right hand was still in perfect working condition. I selected Conform, and saw the bone warp in an instant, perfectly taking the shape of the red outline. I stared at it for a moment, wondering if something was going to happen, but no, it looked just the same as it had on my other pinky finger.

“Okay,” I said, blinking slightly and looking around the barn. “Ropey?” I asked. It formed into a hand and gave me a thumbs up, and I smiled at that.

“It is done?” asked Fallatehr with a raised eyebrow. “So swiftly?”

“I don’t know,” I said, raising my deformed hand. I probed it with bone magic, and could feel it alive once more, connected to my soul. “I need to test it.” I reached into my bandolier and pulled a bone from it, then burned it slowly, focusing the healing energy on my pinky. I saw a change come over it, albeit a minor one, as the bone there made a minor change in shape and the loose skin straightened out. I looked it over carefully, worried that I would see it go white from a lack of circulation, or that something terrible would happen to it.

_quest_progress: Boneitis - You have cured the soul of its affliction, at least in part, and begun to bring your body back to what it once was. The only thing that remains is to finish the job._

**Affliction: Drained Bone (x50)**

“Congratulations,” said Fallatehr with a nod. “You have accomplished within a single day what men spend years learning.”

“What are the limits?” I asked.

“Limits?” Fallatehr replied.

I licked my lips, trying to think of how to say it. “Was it common, in the time of the Second Empire, to mix soul magic with bone magic? If you can burn out a bone and then replace it like that, it would mean that someone with a foot in both schools would have a renewable resource on hand -- so to speak.”

“It was practiced, in the Second Empire,” said Fallatehr, “But soul mages were rare, and most often, it wasn’t worth the time when bones were so widely available.”

“Ah,” I said, relaxing slightly. It was a question of economics, not practicality. I couldn’t trust what Fallatehr said, naturally, but it seemed like the sort of thing we might possibly be able to confirm by either speaking with the crystal that held Amaryllis’ dead great-grandfather, or looking through a few history books. That in turn lowered the chance that Fallatehr was lying about it.

I took the time to do the rest, one at a time because I couldn’t figure out a way to go faster, phalanges and meta-carpals, all twenty-seven bones. This took a fair amount of time, and was relatively tedious while at the same time being somewhat nerve-wracking as I kept thinking about the consequences of making a mistake. When I was finished, I opened my eyes, conferred with Ropey, and then healed my hand, watching it return to normal. Sensation flooded back into it for the first time in weeks.

**Affliction: Drained Bones (x24)**

And that just left the ribs.
“Thank you,” I said to Fallatehr.

He shrugged. “It was far less work than it had any right to be.” He stared at me. "You had inquired about a hypothetical before, how you would deal with a problem without such symmetry to exploit. Not just a hypothetical, if I read you correctly."

"My ribs," I replied. With my hand fixed, I was willing to give him that much.

"All of them?" asked Fallatehr, face blank of expression

"All of them," I confirmed with a nod. I was tempted to offer up some defense of myself, to say that the situation had been desperate, that I hadn't actually had any training as a bone mage beyond what my power gave me, but that was just my instinct toward justifying myself talking, and there was no sense in telling him things he didn't need to know.

Fallatehr seemed to ponder that for a moment. "Your chest will be more difficult, as it forms the link for your internal organs and there is nothing to take from, but from the pace you’ve been keeping, it should only be a matter of days, at which point our primary business will be concluded."

"Implying that we have secondary business,” said Amaryllis.

“So far as I am aware, Juniper still needs a teacher,” said Fallatehr. “I have some interest in the endeavor of his education, so long as I am allowed to study him by way of compensation.”

“Abso-fucking-lutely not,” said Fenn.

“We’ll have to discuss it as a group,” said Amaryllis. “Privately. In the meantime, I think that’s enough of a lesson for today.”

“We’ve barely started,” I complained. “I’m actually not sure how useful this was, as a lesson.”

“It has been many years since I taught,” said Fallatehr, “But when I did, I always thought it important to understand my pupil.”

“You were a teacher?” I asked, genuinely curious. That didn’t quite fit with my idea of him as a mad scientist.

“There were elements of dysfunction within the Guild of the Essential Soul,” said Fallatehr. “In a better world, those pursuing their own lines of inquiry and study would not have been forced to interact with the neophytes. It was not so segregated as it should have been, and given that I was forced to spend a portion of my time away from actual work, I made some effort to be good at it. There were always one or two pupils who were promising candidates for assistants, and later, peers.” He grinned, without showing his teeth, as he said that.

“You’re saying that you can’t give skills directly?” I asked. “You can’t just … transfer knowledge over to another person?”

“Have you seen that, in your own soul?” asked Fallatehr.

“I spoke to a bone mage who implied that it was possible,” I said, which was a half-truth. “Not that knowledge could be transferred, but that knowledge in some sense existed within some bones, and could be pulled from them.”

“But have you seen it?” asked Fallatehr, leaning forward slightly.
“Yes,” I replied, biting the bullet.

“You don’t want to give away too much of your ability, even with soul magic,” said Fallatehr. “Were that mindset not used against me, I might find it commendable.” He brushed a stray bit of dust off his knee. “To answer your question, it was once possible to transfer skills in such a manner, near the dawn of soul magic. It was excluded before I was born.”

I frowned at that. “I don’t believe the location of that exclusion zone is common knowledge.”

“The zone is a mystery,” said Fallatehr. “All that is known is that a certain thing was possible for a fair amount of time, and impossible afterward. Who, where, or what are not questions that were ever answered in my time. What is left is the ability to carve out such things from someone else, given sufficient training and ample amount of time.”

“And you can teach me how to defend against attacks like that,” I said, watching him. “You said that people were stripped of their skills when they were put into the penitentiary, but you retained your abilities as a soul mage.”

“There are a few methods of defense,” said Fallatehr, “But none that are absolute. In my particular case, I was known to the men who would normally have done the extirpation, and they both respected and feared my skill, including my ability to fight back against them, should our souls have made contact.”

“Mutually assured destruction?” I asked.

“That would be one way of putting it, I suppose,” said Fallatehr. “You and I might reach that point with each other, such that you would no longer fear me.”

“Unless I need to sleep,” I replied.

“Is the tattoo of Kenner’s Eye no longer in use?” asked Fallatehr.

“Its use is more regulated,” said Amaryllis, before I could make a fool of myself. “The specific materials necessary became quite a bit rarer following the Appetency War. Acquiring one for each of us is on our path, but it’s going to take some time.” I nodded at that, though I had no idea what the hell she was talking about.

“There are precautions that you can take, to ensure that I have no opportunity to interfere with your soul,” said Fallatehr with a shrug. “Whatever you think my motives might be.”

“Thank you,” I said. “That would go a long way toward creating a working relationship.” I hesitated. “There’s one more thing that would help, which would be your assistance in learning how to access someone else’s soul.”

Fallatehr raised an eyebrow, then glanced at Grak. “No,” he said. He stood up from his chair and I heard the very faint sound of Fenn’s bow being drawn. “Not today. You will not allow me access to your companion, which means that I would be unable to fix any mistakes that you might incidentally make, and if I came in behind you to correct your errors, I might not be able to figure out exactly what was done. It is a more dangerous thing, to touch the soul of another, and I will not have the blame fall to me when a neophyte, even an exceptionally fast learner, makes one of the typical mistakes.”

“Bullshit,” said Fenn.

“Either way, my answer is no,” said Fallatehr. “Think what you’d like. I believe we were concluding
“I don’t want to stay in this place for longer than another day or so,” said Amaryllis. “We have to assume that it’s going to raise some questions that we don’t want to answer. Parsmont isn’t a perfect place for us, but we can go into the city without attracting attention now, and get a place to stay in the longer term.”

Our core group of four (yes, Grak with us) was sitting in the master bedroom. Fenn sat beside me on the bed, with Grak in a heavy wooden rocking chair, his feet dangling above the ground, and Amaryllis standing, pacing slightly.

“So far I think that he’s been of only marginal help,” I said. I glanced at Grak, as I’d done three times now, measuring my words. “It’s only when I hit level 20 that I think he’ll really help me in a concrete, mechanical sense. There wasn’t anything in that conversation that I wouldn’t have been able to figure out on my own, at least as far as soul magic was concerned, though there were a few pieces of historical importance, I guess.”

“You’re assuming it works like that,” said Amaryllis. “We haven’t tested the tutor theory yet.”

“The wording is ‘amateur training’, I replied. ‘‘Amateur’ must mean something, otherwise it would just say ‘training’.”

“Maybe,” said Fenn with a shrug. “Or maybe we shouldn’t be trusting the game that got us into this whole mess in the first place.”

Amaryllis gave me a pointed look that I was fairly sure was meant to indicate that she hadn’t forgotten about the non-anima in the basement.

“Well I’m pretty sure without the game we would all be dead,” I said. “So let’s give it a little credit.”

“I would still be alive,” said Grak.

“Would you have assaulted Aumann’s tower on your own?” I asked.

“No,” he said. “I would have waited until I had a good opportunity. If you had died, I would not have met you. I would still be waiting.”

“Okay, whatever,” I said. That response probably wasn’t the way to increase his loyalty, but I wasn’t willing to play on a strictly strategic level, not when he was going to be contradictory for no reason, or act like teaming up with us wasn’t a good thing.

“We’ll go into Parsmont, keep our heads low, and find a more permanent, less unconventional place to stay,” said Amaryllis. “I don’t want to leave any single person alone with Fallatehr, and obviously there are lingering concerns about Grak’s condition,” lingering being a diplomatic way of putting it, “so I’m going to suggest that the four of us go into Parsmont together, leaving Fallatehr here. That means taking eyes off him, but that’s going to be something that we’re going to have to accept.”

“So that he can soulfuck the neighbors?” asked Fenn. She gave a slight frown of thought. “Wait, that would imply that it was consensual, soulrape the neighbors?”

“How big a problem that would be depends on what we believe about the things that he’s said,” replied Amaryllis. “If he’s unable to imbue someone with skills, and changes revert back after some length of time, then I think it’s a risk worth taking.”
“I’m not sure we’re in a position where we can rely on him for truth,” I replied. “I mean, yes, I don’t think that he can completely overwrite a person in short order, because if it were possible to do that the Second Empire would have looked a lot different. I also think that he probably can’t just skill boost, given that the elves we fought alongside weren’t much better than we were, and neither were the pelehr, and to assume that he was simply orchestrating it all to provide cover for a lie is … I don’t want to say too paranoid, but it seems like too complex and uncertain of a plan. That’s especially as opposed to something like him saying that changes wear off, which is a pretty easy and painless lie to tell with potentially large benefits to him.” I again glanced at Grak, who made eye contact with me that quickly grew uncomfortable.

“You’ll be able to see into Grak’s soul soon,” said Amaryllis. “Once you do, that should clear him of suspicion and we can let him in on what we know. If the four of us are going into the city together, you can use your free time to practice with the soul, which might be enough to look at Grak’s soul without needing instruction.”

“In which case we can slit Fallatehr’s throat,” said Fenn. “Easy peasy.” She glanced at the bottle, which she’d set out in the sunlight. “All we really need in town is a place to stay, right? Somewhere that’s going to let lessons and training get on without too much risk of anyone stopping us? Because if that’s the case, I think Joon and I should handle that part while Grak and Mary teleport somewhere to store this bottle.”

“I don’t like the risks of teleportation,” said Amaryllis. “That two hour window where we don’t have a failsafe escape plan makes me uncomfortable. But … if we have some time to find a suitable place to come back into Parsmont, we should be able to make that work.”

“Agreed?” asked Fenn, looking to me and Grak.

“It’s reasonable,” said Grak. “I can put up wards in order to protect the bottle. You’re most worried about sunlight?”

“Yup,” said Fenn. “Without the baby sun in there, we should at least be keeping it out of the dark.”

“I’m not sure that it matters,” I replied. “In theory, only a small amount of sunlight is actually hitting the bottle anyway, and that’s getting spread out over a square mile, so …” I trailed off, at first because I was doing the math, and then because the math was grim. “Depending on how the magic of the bottle works, it might have already been through the equivalent of two days without sun.” I wasn’t sure that the bottle didn’t have some secondary magical effect though, because it hadn’t felt like only a fraction of the light was hitting us, and I didn’t quite believe that we’d actually been shrunk down.

“Oh, and I should probably do something with the baby sun as well,” said Amaryllis. “It’s getting a little too close to the bottle.”

“Okay,” said Amaryllis, briefly touching the hilt of her sword. “Then we’re good to go, two hours time waiting for the key to recharge should give me some time to contact my ancestor again and try to get some confirmation about the things Fallatehr has said about the soul.”

“I’d like to talk to Valencia before we go,” I said. “She’s --” I glanced at Grak. He was already in the loop on that one, though I’d be looping him in a little more by leaking information. “One of us.”

“I’ll come with,” said Fenn, hopping up off the bed.

“No, but thank you,” I said. “I do really enjoy your company, but --”

Fenn waved me off. “Understood, I can be a pain. But if she’s going to be one of the gang, then I do need some time with her at some point.”
“She’s not going to be ‘one of the gang’,” said Amaryllis, making quotes in the air, with one hand still around her sword hilt. “Not unless we figure out a way to deal with the possession problem. Every time you speak to her, or even speak in her presence, that’s information that goes to a large number of devils intent on causing whatever pain and destruction they can. And if a demon ever gets into her, you’ll have to fight it, which means that she needs to be manacled at all times.”

“But she’s only got the strength of a fairly weak human woman, right?” I asked.

“Imagine a soldier training for thousands of years, in a wide variety of bodies, all with perfect killing intent,” said Amaryllis. “That’s, admittedly, the worst case. I still need to pick up that book on infernal topology.”

“Do you actually think that I’m in danger?” I asked.

Amaryllis hesitated. “I want to ensure that you take this seriously and don’t put yourself in a situation where you underestimate the danger that she poses.”

“I won’t,” I replied.

“I’m not sure that increasing her loyalty is a good idea either,” said Amaryllis. “There’s clearly some connection between our souls, and I don’t want you to make a connection to a devil.”

I frowned slightly. “In theory she doesn’t have a soul,” I said. We were getting dangerously close to the sort of thing that we couldn’t talk about in front of Grak. “But I’ll try my best not to be too nice. All I want is more information. The game inserted her for a reason.”
Seeing Red

I went down into the basement, moving cautiously, the Anyblade held as a knife in my right hand and my left being used as a torch. It felt so good to have two working hands again, and sometimes I moved the fingers of my left hand just to feel them moving. So far as I could see, I was no worse the wear for the soul magic I’d done to myself, and I was already thinking about burning through those bones again as part of the normal course of combat, which would free up my bandolier for more interesting bones, ones with more specific purposes, as opposed to the cow bones that traditionally sat there. My chest was obviously far more important than my hand, given that it was probably going to end up killing me if left untreated, but I would take a victory where I could find it.

“There’s a light switch,” said Valencia, as soon as I was down the steep stairs and into the basement. She was handcuffed to a pipe coming out of a large boiler, looking miserable. The light of my flaming hand gave her a warmer look than I thought was natural for her pale skin and white hair. When I looked down, I saw that she was wearing one shoe, a slipper that Fenn had given her. I had tried to make it comfortable for her, with a blanket beneath her and some food in case she got hungry. That had netted me another point of loyalty, putting me at 9, the cusp of getting Twinned Souls with someone who didn’t have a soul.

I turned around and looked for the light switch, trying to keep her within my field of view at the same time. There was plenty of space between the two of us, enough that I wasn’t worried about her attacking, but I was trying to take what Amaryllis had said seriously, even if it really seemed unlikely that anything a demon in Valencia’s body could do would injure me in any meaningful way.

I let the flame go out when I turned on the light switch, and looked down to see a slipper laying on the ground. I picked it up and looked at it, then lofted it toward Valencia.

“Is there a reason you turned the light off?” I asked.

“I didn’t,” she replied, slipping her shoe back on. “Sometimes when there’s no one around they’re mean to me. Mostly they don’t think I’m a person.”

“Huh,” I said. “That’s … I wonder why that is.”

“Because I don’t have a soul,” said Valencia, keeping her head down and not meeting my eyes.

“I don’t really think souls are actually that important,” I said.

She raised her eyes to look at me. “They are,” she said.

“You’re sort of proof that they aren’t,” I replied. “You’re … a muggle, basically, gated from performing magic, but you still have a personality and memories, skills, presumably, or the ability to learn some skills -- do you have any skills?”

Valencia shook her head.

“Well, you can speak, that’s a skill,” I said. “I don’t imagine that you got much of an education, uh, growing up, but we can work on that.”

“Do you love me?” she asked, watching me with watery eyes.

“Uh,” I said, taking a half step back.
“Because I love you,” she said. “You’re so sweet and kind and understanding, more than anyone has ever been ever in my life, and I keep worrying that I’m going to lose you, and that must be what love is.”

I looked her over, wondering whether she was possessed.

“You’re wondering whether I’m possessed right now,” said Valencia, with a manic smile slowly creeping onto her face. “I suppose I’ll save you the trouble just this once and tell you that I am.”

“Oh,” I said, frowning. “I’ll confess I’ve never spoken to a devil before.”

“You have,” said the thing wearing Valencia’s skin, the smile quite wide now. “Through this creature’s nubile body.” She began undressing, though she was still in manacles, chained to a boiler pipe, so this didn’t go very smoothly.

“I’m not clear on why you would tell me that you’re a devil,” I said, watching it puppet her body. I had a decision to make, about whether or not to look away as it pulled up her dress. Basic Midwestern modesty demanded it, but that would let the devil know that I cared, and not just this current one, but all future ones. And on top of that, the real Valencia was aware of what happened while she was possessed, and she would see me looking away, and know that I was embarrassed or ashamed.

“So why tell me?” I asked.

“It’s true that she thinks she loves you,” said the devil. Having gotten the dress part of the way up her midriff, it was working on moving the panties down. “Always best to say the things that are hurtful and true, they stick in best. She saw your face when I said it, saw your reaction to that love, saw the gears turning in your head, all the sort of heartbreaking stuff that normally gets to her.”

“So you do consider her a person?” I asked.

“No,” said the devil with a smile that didn’t seem like it belonged on Valencia’s face. “But you do, so it works either way.” It had slid her underwear down and was flashing me. I had no idea what I was supposed to do. Leave? Try to restrain her and make it stop? It hadn’t occurred to me that having a gag in her mouth was probably a mercy for Valencia, when a possession came.

“It seems so basic,” I found myself saying.

“Basic?” asked the devil.

“You’re trying to cause pain and hurt in the world,” I said. “Your only avenues for doing that during a possession are manipulation of the body or injection of information, even if that information is false.”

The devil controlling Valencia perked up slightly. “Oh?” it asked.

“The problem is, you’re temporarily inhabiting a body that I know can sometimes house devils, and I know that the information coming from that body is sometimes inaccurate, so … why should I listen?” I asked. “From a strategic perspective … is it just that devils can’t coordinate with each other? Is that why you don’t make an effort to plan for the long-term?”

Valencia stopped exposing herself and her dress fell back down. She looked away from me, back toward the boiler. “It left,” she said. “They don’t like the second guessing, I don’t think.”

“Okay,” I said with a nod, not knowing whether to believe that.
“And you don’t believe me,” she said. She turned back to me with watery eyes. “You don’t believe me because I’m not even my own person!” She started crying, leaning against the boiler pipe we’d cuffed her to. I waited, watching her, knowing that if she was really Valencia there was something that I should be saying to her to make things better, but also knowing that it probably wasn’t Valencia.

“I’m sorry, Valencia,” I said.

She looked up, then leaned over to dry away her tears with her chained up hands. “You don’t have anything to be sorry about,” she said.

“I’m sorry that this world is the way that it is,” I said. Some of that is probably my fault. “I’m sorry that we don’t have a better solution than to put you in manacles in the basement.” Yet. “I think one of the solutions to this problem is that while there’s unreliable information transfer from you, information transfer from us will always get to you, because you’re aware of what happens when you’re possessed. That doesn’t really help you to effectively communicate with us, in a real sense, but when I say things, I can still be sure that I’m saying them to Valencia, even if someone else might be in control of the ears.”

“Why do you care about me?” she asked.

That was a loaded question, especially given that it might be coming from a devil, or that a devil might hear the answer in the future and use it against me. “I don’t know,” I said. “But I do care.”

(The true answer was probably that I was being manipulated by a game that knew which buttons to press in order to get me to care. I cared more about her because she was clearly young, and more because she was a girl (as fucked up as that might have been, from a gender politics standpoint). The most important thing was probably just that she was right in front of me, but I didn’t think that I was good enough at the social stuff to say any of that in a way that would come across well. “Because you’re here, in front of me, activating pathos, with no one else in the world who cares for you.”)

“Oh okay,” she nodded. “I care about you too, because you’re one of the only people that has ever been nice to me. But I don’t really know you.”

I nodded. “And I don’t really know you either. It’s going to be hard, not knowing what’s coming from you and what’s coming from them.” I paused slightly. “Does Fallatehr know of a way to figure out whether or not you were possessed?”

“No,” she said, shaking her head slightly. “When he needed to know something from me he would just ask me over and over again and try to average out the responses.”

“Yes,” I said. I had no idea whether that was true, but it was something that I could cross-check with Fallatehr. “Well, failing that --” I hesitated, wondering whether it was a good idea, then wondering whether pushing her loyalty up was a good idea, but I didn’t think that the game would fuck me over for helping someone, given the cowardice penalties I’d consistently gotten for not helping girls in danger, and the game stuff had always worked in my favor before, “-- if only one direction of our communication is reliable, maybe I can tell you a bit about myself?”

“They’re listening in,” said Valencia. “When they come they’ll be able to hurt you with the things that you say.”

“I know,” I said with a shrug. “It’s not going to be anything earth-shattering, just small things.”

“Small things?” she asked.
“Things I would be okay with the devils knowing, if it meant that you could have someone to talk to,” I replied. “Like … my mom did most of the cooking in our house, but dad was always responsible for the big event meals, when we’d have people over for barbeque or a big,”

Thanksgiving? “Holiday meal or something, and it was always this point of tension between the two of them, because he expected her to clean up after him. The weird thing was that it always came to a head afterward, when it came time for the cleaning, instead of before, when dad was in the process of making all the dirty dishes.”

“No one has ever cooked for me,” said Valencia.

“Really?” I asked. “I guess the prison fed you?”

She nodded. “Mother said that there were gardens and magic that kept us fed.”

“I -- I didn’t know that you had a mother,” I replied. “I mean most people have mothers, unless they’re dwarves, I guess, but the circumstances of your birth aren’t really that clear to me. Fallatehr seemed to indicate that he made you.”

Valencia nodded again. “My mother was in the prison with him. He changed her to be like him, as much as he could, and then got her pregnant.”

“Ah,” I said, trying to keep my face from betraying any emotion. Then I relaxed somewhat, because that wasn’t really the way that I thought things should go between us, not if she was going to be a companion. “I find that sort of tragic.” She was silent, looking at me with her big red eyes. “It’s -- the ideal, as I see it, anyway, is that children should be an expression of the love between two people, the closest that you can get to --” mingling your souls. “I don’t know, I just wish that you’d had better.” I hesitated before continuing on. “You’re more well-spoken than I would have expected.”

“Am I?” she asked. “I don’t feel like I speak well. Fallatehr put my mother in charge of making sure that I was normal, so that he could talk to me when he needed to. He made her like me, but it wore off sometimes, because he was juggling too many people.”

I nodded along at that, wishing that I could trust the information she was giving me about Fallatehr’s limits. That wasn’t the point of this conversation though, and I had to keep that in mind.

We talked for some time, almost entirely about innocuous things. I never mentioned Earth, or anything that was too close to Earth. I certainly didn’t mention the game, or the Dungeon Master, and I tried my best to steer clear of anything relating to my other traveling companions, because I didn’t want to put them at risk. Instead, I talked about the places I’d seen on Aerb, sharing some of what I liked about the world, trying to describe particularly vivid scenes as well as I could remember them. Valencia asked questions, usually not very deep ones, but enough to make me feel like I wasn’t just talking to a wall.

“Do you really like me?” asked Valencia as I got up to go.

“I don’t know,” I replied. “We haven’t known each other long enough, and there’s the whole complication of the devils. But … I think this was pleasant, and I don’t really see why devils would want it to be pleasant, so, yeah,” but as soon as the words were out of my mouth I could think of reasons. They could be playing the long game, or setting me up for a punch to the gut, trying to gain my trust or lower my guard. “We’ll do this again, and maybe make some headway.”

“Until you’re finished with Fallatehr,” said Valencia.

“Oh,” I replied. “No, I had intended to take you into my care.”
Loyalty increased: [Null Pointer Exception] lvl 14!

Companion Passive Unlocked: [Unknown Reference Error]!

Consulting …

Rebooting …

Loyalty increased: Valencia the Red lvl 14!

Companion Passive Unlocked: Infernal Capture!

The messages came through quickly, piling up on each other, almost so fast that I couldn’t read one before the next was pushed out of the way. I stared at the last message, and the words ‘Infernal Capture’, trying to parse it. When I looked up at Valencia, she was looking at her hands.

“What happened?” she asked, looking up at me.

“Uh,” I said. “Did something happen?”

“It’s still inside me,” she replied, looking back down at her hands, then back up at me. “I’m still possessed, but it’s … you were lying to me, when you asked whether something happened, you know that something happened, and you had something to do with it.”

I stared at her. “How do you know that?” I asked slowly. Something had changed about her. Obviously I’d expected that to be one of the natural outcomes of her gaining Twinned Souls, given that she was nearly useless as a party member, but she’d gotten some kind of different thing instead, and I wasn’t sure exactly what was going on. Whether Infernal Capture was a good or bad thing for her (or me) was very ambiguous.

“I don’t know!” she said, sounding helpless and pained. She stopped and watched me. “You knew that this might happen to me,” she said, slightly awed. “You’ve been waiting for some kind of change, but not the possessions, something else, and this is … not what you expected, and you’re trying to figure out whether it’s good or bad for … us?”

“Where’s this information coming from?” I asked, trying to keep my voice calm and steady.

“I’m thinking like one of them,” said Valencia, stepping back, catching the chain of her manacles on the pipe. “I’m being clever in the way that they always were, it’s … I can feel it inside of me, still wearing me, like I’m its glove, but … but I’m the one in control, moving the hand inside me. Feeding -- feeding? -- feeding on it. On the devil there.” She looked at me. “You don’t believe me. You think that it might be a trick the devil is pulling.”

“It’s a possibility,” I said. “Look … if this is real, then I think that it’s probably better that Fallatehr doesn’t know about it. Can you -- would you hide it?”

“I could,” said Valencia with a nod. “With this inside of me, I --” she stopped. “And if it leaves, he never actually trusted me, if you’re going to kill him and take me with you --” Her words were coming out in a rush, sentences and thoughts half-formed before being abandoned.

“I’m not going to kill him,” I said.

“You’re lying,” said Valencia, looking me over. “But you’re lying because you don’t want me to leak it back to him, and I think that’s probably okay.”
“The devil is helping you to think?” I asked.

Valencia nodded, swallowing hard.

“Okay,” I said. “Uh, give me a few seconds.” I closed my eyes before waiting for a response, waiting three seconds until I had the character sheet up, then quickly moving over to the companions section.

**Valencia the Red, Loyalty lvl 14**

Valencia is a nonanima, a humanoid without a soul, created by the essentialist Fallatehr Whiteshell in the Amoureux Penitentiary where she lived for the first seventeen years of her life. Until recently she was subject to repeated possession by demons and devils at random intervals, but now, touched by your magic, she has become something to be feared, for much different reasons than she was before. She is nearly a newborn, in some ways, trying to find her feet.

And there, just below the biography:

**Infernal Capture:** Valencia is a loyal companion, now properly part of your kharass, though she is still without a soul. The non-anima is grasping, reaching, an unnatural construct trying to find its way in the world. Power has, for the first time in her life, found its way into her hands.

I opened my eyes and looked at her. Before, her character bio had displayed the same null reference exception, but now it was filled in, which seemed like it was good news. The message about the game rebooting itself, well, that was more troubling, as was the message about consulting, but whatever had happened, I had no more information on it than that. I closed my eyes again, this time to dip into my soul.

I found Valencia’s line almost immediately, coming off of my soul like the ones for Amaryllis and Fenn, but on following it, I found the end twisting and turning in the wind, leading off into nothing. I frowned at that, then dropped out from soul-vision to look at Valencia again.

“Take me with you,” she said.

“I can’t,” I replied. “Not right now, not without raising questions from Fallatehr, questions that I wouldn’t want him figuring out the answer to.” I didn’t want to leave her in this basement if she’d just leveled up, but didn’t really see that I had much of an option. My hope was that Fallatehr would just stay away from her; I would place one of my last vines around the door as a precaution, though I didn’t know what their range was.

“You’re going to come back for me,” said Valencia. “You’re going to kill him once he’s shown you what he knows.”

“You’re saying that like you know it for a fact,” I replied.

“It’s written on you,” said Valencia, staring at me in wonder. “Is this what it’s like, for a devil to see people?”

“I don’t know,” I said. “I do still need to go, but I’ll help you to figure it out when I come back.”

“And you are coming back,” said Valencia, nodding as though she knew this as a fact. “You actually do like me. You think of me as ...” she hesitated, disappointed, “A sister.” Confusion crossed her face. For all that she’d claimed to be able to read me like a book, her own emotions were as plain as day. Whatever the devil inside her was doing, it wasn’t giving her the ability to lie. Or, wait ...
“Try lying to me,” I said.

“About what?” she asked, eyebrows raised.

“Anything,” I said. “Something that we both know is false.” I touched my breastplate. “Tell me it’s red with black streaks.”

“Why?” asked Valencia, the confusion apparent on her face. “I thought you wanted me to lie? What color does it look like to you?”

I looked down, then up, staring at her. Her confusion faded away to a wide smile, and she gripped the pipe she was chained to, having little other way to express her excitement. “I did it!” she said. “I know what it feels like now, to be the one to do it, to say things that aren’t at all true and just, you believed me!”

I nodded. “You’re taking the devil’s power, somehow,” I said.

“I told you,” said Valencia, speaking fast again, “I’m the glove it fit its hand into, but now that hand is mine, because I’m its glove.”

I understood that as a metaphor, but not how it worked in practical terms, but the practicalities of demonic possession hadn’t been clear before they’d been upended. “So was Grak touched or not?”

Valencia froze. “Yes,” she said. “What I said, last night, that was the truth. I was possessed when I said it, but it’s the truth.”

“So you lied to me before,” I replied.

“I -- I didn’t know that you were going to save me, I thought that you would leave, like he always said would happen if anyone wanted to take me,” said Valencia, “And he knew that you wouldn’t know, if the devils let it slip out, what was the truth and what wasn’t, it was, he had such plans and to go against them --” she stopped, watching me again. “You’re not upset.”

“I’m not sure that I trust you,” I replied. “But I trust you more now than when I came down here, and I think that’s a good platform for us to start from, whatever has happened in the past. I’m not going to be angry about you not showing instant loyalty to me.”

“Okay,” said Valencia, in a way that was totally unconvincing. She shifted slightly, watching me. “Okay,” she said again, this time in way that showed relief and acceptance. I couldn’t tell whether she was processing what I had said, or whether she’d decided to lie to me, but I turned away before my face could betray that thought.

“I’ll try not to be too long,” I said as I took my first step up the basement stairs.

“I’m going to be better, when you get back,” said Valencia. A quick look back showed that she was standing there, looking at her hands.

I worried about how much better she was going to be, but kept that thought private.
The farmhouse had come with two cars, one that had been taken by Fallatehr’s people, the other of which we used to drive to Parsmont. Halfway there, while we were still in farmland, Fenn stopped the car to let Amaryllis and Grak out so that they could take a walk over to one of the lines of thick trees that served as a windbreak for the fields and teleport out without having to worry about anyone seeing them when they came back. Amaryllis took the leaf-cloak with her, and following some deliberation in the car, Ropey stayed with me, on the theory that Ropey technically belonged to Amaryllis, and she could compel him to lie. This wasn’t something that she had mentioned when I’d woken up in the morning, which made me slightly uneasy. I’d been thinking of him as mine, or if not mine, then fully independent. It wasn’t a logarithical problem, because I could just look into her soul if I needed to, but it was still disconcerting.

I didn’t tell Amaryllis about Valencia, partly because I didn’t want to have to push Grak out of hearing range again, which itself was an information leak, and partly because I didn’t want to have to hear her get on my case about having pushed Valencia’s loyalty up so high.

“She’s probably going to tell you that it was dangerous and stupid,” said Fenn after I’d told her everything. “Which is a fair point, but I’m not sure I’d agree, since the game doesn’t seem like it actively wants you to fail, it just likes to torture you.”

“That doesn’t seem like it’s a good thing,” I replied.

“But that’s the basic thing between the DM and the players, I thought,” said Fenn, keeping her eyes on the road. This was my first time inside an Aerbian car, which seemed too narrow and had that weird bump on the hood that seemed like less of an obstruction from the inside. “You want the players to get roughed up, but then they come through all the pain, mutilation, and horror triumphant, having gotten the girl and slain a dragon.”

“Usually you don’t get the girl,” I replied. “Not in my campaigns, anyway, it always felt weird. And you weren’t actually feeling the pain of the characters, or anything like that, it was all make believe, not torture.”

“I think torture is a strong word for this scenario,” said Fenn with a frown. “I mean, you have me, right?”

“Fenn, light of my life, fire of my soul, you are the furthest thing from torture,” I replied. I reached over and laid a hand on her thigh. “I didn’t mean to say that you’re not lovely, because you know that I think you are, it’s just … I was dropped out of a plane into a land of the undead, so maybe my view of my role in Aerb is a bit warped.”

“Speaking of fire of your soul,” said Fenn. She snapped her fingers, and flame came out from the tips of them. “I got that business working while you were having your secret meeting with another woman. Out of the view of our dwarf friend.”

“I’m impressed,” I said with a nod.

“You’re not that impressed,” said Fenn, letting the fire go out, “You got it in two minutes of being told it was a thing.” Her eyes stayed on the road.

“No, I am impressed, it’s just … when I saw the description of Symbiosis I thought that it would be a little bit more spectacular than that,” I replied. “I thought you would go from zero to ten in a matter of
“Well, whatever,” said Fenn. “I’ve got the blood thing working, the bone thing working, --”

“That too?” I asked, actually surprised this time.

“Yup,” said Fenn. “I pretended to be cleaning up some garbage, which probably would have been suspicious if Grak knew me better.”

“I thought he knew you pretty well,” I said.

“Well, it’s not like he would be able to make a guess just based on that,” said Fenn. “I’m still holding out hope that your little missy isn’t right about him.”

I squeezed her thigh once. “Do we need to talk about that? I asked. “Are you … jealous?”

“Your darling Fenn?” asked Fenn, putting a hand to her chest to show just how shocked she was. She let it drop when I didn’t smile. “She’s Joonbait,” she said. “And it’s not like there wasn’t already competition. I’m already dealing with not being the prettiest maiden in all the land, I didn’t really want to be out-competed on two fronts.”

“Ah,” I said. Amaryllis. “You know that’s nothing that you have to worry about, right?”

“Yeah,” said Fenn. She reached down and laid her hand on top of my own. “I just, really, really like you. And it’s different for elves. They don’t have dating. The idea of an elf trying out a relationship to see whether or not it’s going to work is … well, there’s a reason that they don’t really like other species that much, and a lot of it has to do with the very specific elf way of doing things. You don’t practice swinging a sword until you become proficient, you do it right the first time, and you do it the same way, the perfect way, every time after that. Marriage, for an elf, is just slotting into someone’s life, perfectly and completely, without second guessing or shopping around like humans do.”

“And that’s why Fallatehr is an abomination of an elf,” I said with a nod. “He’s willing to fail, like a human would.”

“I don’t really want to talk about him right now,” said Fenn. She gripped the steering wheel hard until her knuckles turned white, and I stayed silent. “I used to think that a lot of the elves were faking it, you know?”

“I was kind of wondering that,” I said. “People say in public that they aren’t picking up the sword until they can make the perfect cut, but that’s not the whole picture, because a lot of them are training in private away from prying eyes, or fathers and helping sons, and it’s more about a culture of not appearing to need practice or training. But you’re saying it’s not that. They just … meditate on doing whatever it is they want to do, or something like that, and then do it.”

Fenn nodded. “I tried to fake it,” she said. “I got caught a few times, then stopped really trying, which naturally meant that everyone hated me for my imperfection, not that they wouldn’t have anyway, because I was visibly imperfect.” She bit her lip and leaned forward slightly to peer at another car as it passed us. “I feel like if you were an elf I would find myself just constantly explaining how humans do things. Seems like it must be annoying.”

“It lets me know more about you,” I said with a shrug. “I don’t tend to like the stuff I hear about elves, but I like hearing you talk about what it was like for you, growing up in your small slice of this plane.”

“Anyway, I was coming around to a point,” said Fenn, glancing over at me briefly.
“Were you?” I asked.

“My point was, I never really expected that I would ever have a relationship like married elves have with each other,” she said. She let that hang in the air for a bit, watching the other traffic. We were getting close to Parsmont proper now, the big hill of a city, which meant more attention on the road.

“You said that elf marriage wasn’t really about romance,” I replied.

“I didn’t mean that,” said Fenn. “I meant, more, it’s like these two elves just fit together suddenly, they snap into place and then can’t ever be taken apart, and it’s not about the romance thing because it just is.”

“That sounds really romantic,” I said.

“Does it?” asked Fenn, glancing over at me again. “I always thought of romance as the human stuff, the courting and the invitations, opening up to someone, having them judge you, judging them back, I don’t have a lot of experience with any of it, but … I always thought for humans it was trying to find someone whose good points overwhelm their bad points, or deluding yourself into thinking that’s the case, and that’s romance in a nutshell.”

“That … is not a good description of romance,” I said.

“Well, whatever,” replied Fenn. “Not really my point, my point was that I never felt like I would have someone that I fit with, someone who could be the tenon to my mortise, and I feel like I’ve found that in you, but I keep thinking of all the ways that I’m probably wrong.” I had no idea what a mortise and tenon were, but I’d gotten good at letting words specific to Aerb float by me.

“If there’s anything that I’ve done to make you think--” I began.

“No,” said Fenn, “No, it’s, I think I’m thinking about how useless I was in the prison, and then the upgrade I got last night that I don’t feel like I earned.”

“You feel inadequate?” I asked. “You, of all people? You’re literally the best team member I have.”

“That’s very sweet of you to say,” replied Fenn. “But most of that is because I’m the most loyal to you, and most of that is that you decided that you liked me enough for us to have a relationship, and it’s that I don’t really feel like I deserve. Even if it’s destined to end horribly. Maybe especially if it’s going to end horribly.” She peered over at one of the signs. “This is where we park.” She turned the wheel and took us down a street, slower now that we were within the city, and eventually turned into a large parking garage, where an attendant held up a hand, telling us to wait. “So our plans for this trip--”

“Are we going to just leave it at that?” I asked. “You don’t feel like you’re worth my time, and we’re just supposed to move on from that? That’s my girlfriend you’re talking about, I won’t let those harsh words go unchallenged.”

Fenn sighed, not seeming to take any joy or comfort from what I’d said. “I spent a decade looting one of the tamer exclusion zones,” she said. “I was a bit player. And now I’m, you know, sitting in a car with a guy who, an hour ago, accidentally turned off the world and then started it back up again.”

“Not quite how it happened,” I replied. “And it’s not like I was someone special before coming here. I was probably one of the least important people in Bumblefuck, Kansas, and my home town wasn’t in any way important to the state, which in turn was, you know -- they called them flyover states because for the most part, the only interaction you had with them was to look down during a plane trip and then maybe think ‘man that’s a flat and boring state’.”
“Also, loyalty can go above 20,” I added.

“Thank you for making me feel better,” said Fenn. She gave me a warm smile. “We’re going to have to find some way to, ah, grind that loyalty up, if you know what I mean. And I do believe that we are owed our first actual date, which Parsmont can hopefully provide.”

“Okay, so your plan is to bus people in?” I asked Craig. “How do you plan on doing that?”

“We pay them a silver for their time, get big old wagons, and bring them in to vote for us,” said Craig. “We’re the equivalent of millionaires with fuck-you money, almost all of which is liquid.”

“No, it’s illiquid, tied up in weapons, armor, and other magical equipment,” replied Reimer. “If you’re playing right, you shouldn’t have more than a few percent of your money as gold.”

“Fine, fine,” said Craig. “We’re billionaires with millions in money that we’re not doing anything else with, because we don’t have mortgages or children or pay taxes.”

“Don’t give Joon ideas,” laughed Reimer.

“The minute someone assesses a tax on my looting is the minute I start a one-man civil war,” said Craig. “I will burn this fucking place to the ground.”

“Noted, in case I need you guys to start a civil war,” I replied. “You’d be non-state actors, making warfare a little hard, but … okay. With this bussing plan, has it occurred to you that other people might already have tried it?”

“NPCs aren’t that smart,” said Craig.

“It’s literally the first thing that anyone would try,” I replied.

“Not me,” said Tom. “Wait, I ask the fish guy about that, whether I can get paid a silver for my vote.”

“You shouldn’t be able to,” said Arthur. “Votes are transitory. I mean I guess if you can see the voting jewels, or vewels, if you will, in your head, then maybe people could confirm that vewels had been transferred over, before the people -- wait, do the jewels stay voted when the person who voted leaves the area?”

“They do,” I said. “Once transferred, the only thing that can remove them is the person who did the transfer taking them back with a thought.”

“Even death?” asked Tom.

“Please, please don’t get any ideas when I say yes, you keep them even if the person who gave them dies,” I replied.

“In an unrelated note, we should kill people after they vote for us,” said Reimer.

“How’s that going to work, if they can revoke the vote as the sword is coming toward their throat?” asked Arthur.

“Threaten their families, obviously,” said Reimer with a snort.
“What’s your alignment?” I asked with a frown. I knew damned well what his alignment was.

“I’m trying to think like a criminal would,” said Reimer, using his most pious voice. “Obviously those dastardly scum would try any dirty trick in the book, and part of my job is to anticipate and then stop them.”

“I don’t think the bussing thing is going to work,” said Arthur. “The transitory nature of the jewels makes it too unwieldy and kind of unworkable on the larger scale, because you’d need to verify every transaction personally, and then also have to have some way to not have people take their vote back if they’re ever in Parsmont again.”

“Also, it’s not what you’re doing here,” I replied. “You’re here to retrieve the MacGuffin.”

“Which we’re under no time pressure to do,” said Arthur.

“So Homeland --”

“Homeleron,” I interjected.

“So Homeleron,” said Tom. “Who are the top vote getters in Parsmont? Is it like a Mount Olympos type of deal, with a bunch of people everyone loves, or is it more like a, what do you call it,” he made a shape with his hands.

“Bell curve?” asked Arthur.

Tom snapped his fingers and pointed at Arthur. “Yes, exactly.”

“It wouldn’t be normal distribution,” said Arthur. “I mean, it could be, with the center being something like a hundred jewels or whatever we start with, but the lumps of distribution probably look different.” He turned to me. “Power law?”

“Homeleron doesn’t know what that is,” I replied. “But he will tell you that in Parsmont, there are those vested with the power of their peers, hundreds, maybe thousands of them, but almost all of the power is in the hands of only two, Abswifth and Bendon, not so much people as appointments that people ascend to, two powers that keep each other in check.”

“Cool,” said Reimer. “Let’s kill them.” He smiled at me. “Is what I would say if I were a villain.”

We left the car at the parking garage, which wasn’t actually a ramp at all, instead being a giant motorized contraption that put cars into specific slots by attendants who transferred over a small wooden chit. I didn’t really trust any of it, mostly because it looked like it had been built in the 1930s, but the car was a very recent purchase, and we didn’t have to be in the garage while it was moving things around, so I held my tongue.

“So what are the sights to see in Parsmont?” I asked as we strolled down the street.

“No clue,” replied Fenn. “All we really need is a book and an inconspicuous place to stay. I probably know less about this place than you do. You feel that thing in the back of your head?”

‘That thing’ was the two depressions I could feel in the back of my mind, one filled with jewels and the other empty. Most of the time I wasn’t aware of them; I could forget about them in the same way that I could forget about the fact that I was constantly seeing my nose in peripheral vision. I’d been able to feel it back at the farm, but less concretely than I could in the city. Parsmont as I’d constructed it had a hard border, but here it seemed to be more squishy. I couldn’t tell whether that was a
fundamental design disagreement between myself and the Dungeon Master, or a result of the conversion of Parsmont into an Aerbian region.

We walked through the city streets, arm in arm. I had left my armor behind, on the theory that it would draw more attention to us than we really wanted, and Fenn was similarly unarmored. We needed to find something defensive for her to wear, but that was a gap in our armaments that we’d had since her last suit of armor had gotten sliced through. She wore a hat to hide her pointed ears, making her look human at first glance.

She talked happily as we went through the city, first complaining that black gloves didn’t really go with anything, and after that talking with me about the buildings and people we saw as we went. Parsmont had a much more homogenous style than Cranberry Bay, flat slopes on the roofs with a fair amount of plants sticking up from rooftop gardens, a clean style with little in the way of embellishments, and then riots of color where a full wall would be given over to a mural – but the murals were all similar enough that I thought they were all part of the same project, or maybe done by a small collective. They used thick lines, bright colors, and an abstract style, mostly depicting natural things, drawn so large that they couldn’t be contained by the canvas of the walls.

The streets were narrow, and the few cars and trucks we saw squeak through the crowds were slim as well, none with two seats, most thin enough that I could have easily wrapped my hands around them. I could see why Fenn had put our car into the garage before we’d come in. There was something about the aesthetic of Parsmont that I really liked, maybe the way the hill shaped the city, maybe the general vibe, or maybe the way that the narrow streets and sparse motor traffic made everything feel more human. It had its political problems, given that it was at least somewhat like the Parsmont that I’d written up, but it wasn’t a bad place.

We found a large bookshop and perused their selection for a bit until we found a big book of detailed maps of Aerb, including a section on infernal topology. Aerb was massive, ten times larger than Earth, which meant that it was pretty rare to see a map with all forty-four continents on it. Instead, the map book was divided up with different areas in different sections. Before I bought the book, I looked for Parsmont, which was sat right in the middle of a huge area of mostly-flat farmland, an area that was equivalent in size to the entire Grain Belt of the United States. On the infernal topology map, Parsmont was marked with dark red stripes, which the key said meant that the hells were close, and tightly packed against each other. From what I knew of the hells, there was some kind of notional fourth-dimensional distance at play -- and in Parsmont, they were fairly close to us.

I checked out Anglecynn as well, and saw it mapped in grey, both the country proper and most of the surrounding continent, including the Zorish Isles. According to legend, when the Apocalypse Demon had reared his head, Uther had gone on a long quest to track down the warhammer Marcion, which everyone else had considered Apocryphal. He’d returned to Anglecynn at the final moment and hit the Apocalypse Demon so hard that it had crashed through every single layer of hell and bottomed out with such force that it permanently pushed every single hell away from Anglecynn, like a four-dimensional crater. After that, demons and devils weren’t really a problem that a well-armed militia couldn’t take care of, or at least that was how the story went.

When we paid for the book (along with a few others that piqued my interest) we left to go find a suitable place to stay, but when we were half a block from the bookstore, a man landed in front of us. He was wearing brightly shining, fully-embossed full-plate, with a sword that had to have been eight feet long, but my eyes were drawn to the grin on his face, his perfectly straight, pearly-white teeth, and the way his smile reached the corners of his eyes. He was one of the more handsome men I’d ever met in real life (or what amounted to real life these days).

“Sorry,” he said as I put away the Anyblade, which I’d instinctively drawn (thereby shooting the
element of surprise in the foot), “I didn’t mean to startle you.”

“It’s fine,” I replied. “We’re not from around here. You must be the Abswifth?” He nodded, smile not leaving his face. “I wasn’t aware that you came to greet tourists that were passing through.” My heart had already started to hammer in my chest. He was too clean, probably brokenly powerful, and he definitely shouldn’t have been talking to us.

“I take a special interest, from time to time,” said the Abswifth. His smile didn’t falter. “Tell me, where do you come from?”

“We’re staying at a farm some ways away from the city,” said Fenn. “So are you like, police or something? I never really understood how that worked here. Are we supposed to tip you in mind jewels?”

The Abswifth laughed, loud and boisterous. A small crowd had begun to gather around us, which I didn’t like at all, not that I thought I could outrun this guy. My mind started racing as I tried to figure out why he was talking to us. Had he spotted us? Had we been reported by the people who owned the farm? Betrayed by Fallatehr somehow? His goons had gone into the city ahead of us, that was certainly a possibility.

“You have spunk,” he said, wagging a finger in Fenn’s direction. “I’d like the two of you to come with me, I assure you that this is all quite routine.”

Yeah, I didn’t buy that for a second. Parsmont was a large city, and there were too many people here for one of the two most powerful people to randomly take tourists in for screening interviews. ‘Quite routine’ wasn’t a phrase that inspired much confidence either; just because someone was following a plan didn’t mean that it wasn’t something serious.

“Do we have a choice in the matter?” I asked. I saw Fenn cast a glance in my direction, and felt her hand squeeze mine in a we’re-in-this-together kind of way.

The Abswifth’s smile faltered. “I would prefer not to compel you by my authority, but I believe the matter is important enough for me to lean on that power, should you force me to. I assure you that it will go better for you if you cooperate.”

I felt something at the back of my mind, and turned my attention there while keeping eye contact on the man with the ridiculous eight-foot sword. Jewels were coming in there in volume, which I hadn’t expected at all. I guessed that it shouldn’t surprise me though, given what Amaryllis had been able to tell us about this place, and what I remembered from my sessions. The Abswifth stood on one side of the fence, and the Bendon stood on the other, which meant that there were always going to be a great deal of people ready to stand in opposition to either of them, even if it was just by proxy. A hushed crowd had grown around us, and some of them apparently wanted to throw their weight behind me.

“I don’t want any trouble,” I said. “But if you’re going to ask for my time, I’m going to insist that you do so officially. Otherwise, we’ll be leaving.”

I saw a flicker of annoyance on the Abswifth’s face. He had been holding his sword with the flat of it against his shoulder, but brought it down, moving a massive amount of metal with frightening ease. “By the authority vested in me by the citizens of Parsmont, you are hereby ordered to follow upon penalty of death, for the good of this city.”

I couldn’t read the subtext, but the audience we’d gathered really must not have liked that. The jewels were piling up behind me, in opposition to this man exercising his authority. I was scared, certainly, but I also found that interesting; the Abswifth and Bendon that I had made were essentially
criminals, save that they had the force of government behind them, and they didn’t really have to care about pleasing people, because all of the Abswifth’s supporters were essentially locked into supporting him by the reality of the system, and the same for the Bendon. I won’t claim that this was especially subtle on my part, but my defense is that I was fourteen and reading about things like Duverger’s Law and basic political theory.

“And you can’t tell me why?” I asked. “I’m being taken into your custody without any explanation?” This was, I will admit, poking the dragon a little bit, but it did serve a purpose besides just challenging him for no reason; I wanted to see what he would do with the challenge, or whether he would divulge something in order to keep the people happy.

“I can’t speak of it, for reasons of security,” said the Abswifth, frowning. “Do you disrespect Parsmont and its citizenry so much that you will force me to kill you here in these streets?”

“No,” I replied, holding my hands up. I saw his eyes go to my ring, the Anyblade, but he said nothing about it. “From what little I’ve managed to see of it, this is a lovely city, but this seems irregular to me.”

“Not so much these days,” called a voice from the crowd, which generated some murmurs. I watched the pile of jewels get a little bit smaller. My guess was that some of the people who had impulsively thrust their support behind me were pushing their ‘vote’ toward whoever had spoken.

The Abswifth winced at that, but said nothing in response, and once again gestured with his ridiculous sword for us to go in front of him. I stepped toward him, with Fenn close behind us, and watched as the crowd parted for us.

“Care to tell us where we’re going, if we’re to be walking with a knife pointed at our backs?” asked Fenn.

“My tower,” he replied. “Look up and to your right and you’ll see it, it’s the one in white.”

So I looked up the hill, and saw what he was talking about; it was a spire, more than a tower, a needle-thin thing that I had taken for being some bit of infrastructure before. The scale of it was hard to pin down, but given that it wasn’t an equivalent to a radio tower, it had to have been four or five hundred feet. And as we passed by a building that was partially blocking my view, I saw its companion, a tower of black.

Fuck.
As we went through the streets of Parsmont, the Abswifth followed us, sword propped up on his shoulder, calling out directions, “turn here” or “around the cart” as we went. He wasn’t the only one following though. Most of the crowd had dispersed, but there were others who lingered on, keeping some distance back to be clear of the Abswifth’s sword, or flanking our sides. There were a few camera flashes, which startled me, mostly because it was the first time I had seen a camera on Aerb. They were big and bulky, each the size of a shoebox with a small, clear cube on top that emitted an almost painfully bright flash and had to be replaced between each picture. I wasn’t at all pleased by that, nor the idea that these men were surely reporters. We were, after all, wanted criminals in other parts of the world.

I followed the Abswifth’s lead in not saying much, and to my mild surprise, Fenn did as well. At a different point in my time on Aerb, I might have gawked at the people and places we passed by, the occasional wide plaza that served as a reprieve from the narrow streets, or the breaks in the monotony of Parsmont’s mostly human population: a bullfrog Animalia smoking a pipe outside a butcher’s shop, a dark-skinned woman with enormous antlers that had been hung with jewels, and a skull sitting inside a humanoid form of water among them. Instead of indulging my desire to stare at every curiosity we passed in order to compare it against what I had read in my books, I tried to think.

First things first: the Abswifth and the Bendon both had needle-like towers, thin to the point of being a bit ridiculous, one white, the other black. This wasn’t just a peculiarity of their culture or a symbol of their powers, it was a Clue, because I had designed those towers -- just not for Parsmont.

They had come from a campaign I’d run when I’d been really into microworlds, the sorts of places where you could drive a car from one end of creation to the other in an afternoon (though not literally, because we very rarely played tabletop in systems that had cars). Angled Ovid [sic] was a world of good and evil, with specific quantities of good and evil being directly proportional to how far ‘north’ or ‘south’ you were on the ovoid. I won’t get into the nitty-gritty of it, but the north pole had the tower of ultimate good, set into the center of a bustling metropolis, while the south pole had a matching tower of ultimate evil, set into the center of screaming fields of the eternally tortured. We didn’t actually play a full campaign there -- Angled Ovid [sic] was one of a few worlds suspended in a bottle in a god’s workshop that the group were going through. They didn’t spend more than a session there, and as a consequence, I hadn’t really fleshed the microworld out too much.

So what the fuck were those towers doing in the middle of Parsmont, sitting right next to each other, apparently inhabited by the city’s two most important and powerful people? I had no idea, other than that the towers were a powerful magic, and that didn’t bode well.

With that mystery set aside for the moment, I started thinking about the other big question, which was how the Abswifth had found us, and how he knew who we were. He hadn’t said our names. Did he know our names? Did he have some kind of dossier on us? Some magic tracking us? Our list of enemies was actually pretty short; Hyacinth Prentiss was one, Fallatehr Whiteshell was the other. There were a few other loose threads out there, like that velocity mage of Aumann’s way back in Barren Jewel, but I didn’t really consider any of them prime suspects, and only worth worrying about because bringing back early, inconsequential or “off-screen” enemies was one of the things I liked doing as DM. Doris Finch was out there as well, nine and a half million of her, and she had some way of tracking us, even if it wasn’t a very good one, but she didn’t really seem like she had a reason to, especially since she needed intermediaries to pass beyond her domain.

Between Hyacinth and Fallatehr, I was leaning heavily in the direction of Fallatehr, but what I
couldn’t figure out was what his endgame was. Was he trying to introduce a complication that only he could rescue me from? That did seem to be his style, from what I had seen. Giving someone enough rope to hang themselves allowed you a lot of leverage if you were the guy who could cut that rope, and that was his modus operandi, at least with regards to me. This was different, because clueing in the authorities in Parsmont left a trail of incrimination that would point back toward him, and it placed the sequence of events outside of his control. He had the means, via his minions, he had the opportunity, when they went into town, but I wasn’t clear on the motive.

What I had to do was backtrack. I could safely assume that if this was Fallatehr’s doing, he had gotten his minions to do it. What information had he had when they’d been sent away? I tried to recall the conversation in its entirety, but it had been brief, and most of my attention had been on the possibility that his two minions would start a covert campaign of tampering with souls, instead of just going to the police.

**Skill unlocked: Analysis!**

*Fucking finally,* I sighed. I’d spent some time trying to unlock that one, and every time I’d been deep in thought, I’d been thinking that surely those thoughts counted as analysis. I ran back the train of thought again, trying to figure out what the game had seen in how I was thinking.

**Skill increased: Analysis 1!**

The Abswifth was practically a god, or maybe a demi-god, at least within the bounds of Parsmont, so I doubted that Fallatehr’s minions had gotten to him. He wasn’t the sort of man you could just grab by the throat and take into the alley so you could have your way with his soul. That didn’t mean that he didn’t have underlings, and those underlings would be a little easier to subvert, but that again left the open question of what purpose this would have in helping Fallatehr achieve his aims, whatever those actually were. I had thought that he wanted my power, but if he had thrown me to the police, I wasn’t sure why he would have gone through with a scheme that saw me in the hands of the Abswifth.

The case for Hyacinth was a little more straightforward. Following Larkspur’s death, and unknown to us, she had decided that it was worth it to find us after all, and either by working with Doris Finch, or dipping into the strategic reserve of elf bones, or some other unknown method, she had found us and sicced the Abswifth on us, presumably so that she could find and kill Amaryllis, thereby inheriting an enormous arsenal of hereditary loot.

**Skill increased: Analysis 2!**

I’d been hoping that maybe I could use the timing of the skill ups for Analysis to know when I was on the right track, but that didn’t seem to be the case, because the trains of thought I’d been having when the skill ups happened pointed in different directions, and the idea of Fallatehr working with Hyacinth had far too many holes in it to be true.

There was a wall around the white tower, tall enough for privacy from even a giant. There were people picketing outside the wrought-iron gate, but they parted easily enough at our approach. In my (admittedly limited) observation, there were a few different types of protestors: the ones with a burning rage they had to express with effigies and shouts, the ones who saw protesting as a fun event of mutual camaraderie, and the ones that treated it as something like a job. That last one was how the protestors outside the white tower looked to me. They had the same expressions that I’d seen on protesters outside a woman’s clinic in Wichita, not burning with fury, but trudging along because it was a thing that had to be done.

The gates were pulled back by a pair of guards as soon as they saw the Abswifth, and we went
forward through a plaza that surrounded the tower. It was devoid of people and plants, leaving only plain hexagonal tiles that reminded me of a battlemap.

“Okay,” said Fenn, as she came to a stop, halfway to the tower. “We’re away from the ears of the masses, who do you think we are and what do you want with us?”

“Keep moving,” said the Abswifth. “We’ll speak in my office at the top.”

“No,” I replied. I’d stopped just after Fenn. We had both turned to look at the Abswifth, in his shining armor and ridiculously large sword. “It would be too easy for us to disappear into that tower and never be seen again. Here, at least, we have eyes watching us.”

“The eyes are the problem,” said the Abswifth. “Lip readers are so cheap that the Bendon can have them stationed outside the tower around the clock, but there are worse intrusions into the sanctity of my domain, so long as we stay outside my office. I would have you think carefully about who you are, and what I might know about you. I imagine there are things you wouldn’t want spread to the ears of every person of importance in this city, especially if they turned out to be false.”

Fenn looked to me. “He’s trying to play us,” she said.

“Play us?” I asked. “Or is he just trying to get a deal that’s sweeter for him than for us?”

“That’s what playing us is, you dolt,” said Fenn, crossing her arms. She turned to the Abswifth. “We’re going to need some kind of concessions to go up that tower.”

“No, we won’t,” I said. “We’ve done nothing wrong, and he’s just doing his job.” That was, admittedly, a very charitable assumption. “I’m not happy about this situation, especially since nothing has been explained to us, but I don’t want to make it more difficult or time-consuming than it needs to be, nor do I think we should be trying to profit from it.” I was hoping that a little bit of good-prisoner/bad-prisoner would go a long way, and that Fenn wouldn’t fight me too hard on this. I was also, have to confess, a little bit worried about how much this guy was actually constrained by PR considerations, and whether we wouldn’t be knocked around once we were inside.

Fenn gave me a sigh and then nodded to Abswifth. “Fine, we’ll go up your stupid tower.”

We stepped into the tower, through an open doorway that showed no sign of ever having held doors. The blindingly white walls gave way to a dimly lit interior space, with ceilings fifteen feet high, timbers of dark wood held up at regular intervals by sunken posts. The tower wasn’t terribly thick around, not given that it was hundreds of feet tall. The room was large and spacious, but it was just a single room, with the full curve of the tower visible. A row of desks held four people, each stopping what they were doing to look to us. A woman began rising from her seat before the Abswifth gave her a shake of his head. None of them returned to what they were doing though, which made the silence seem louder.

At the far end was an elevator, more crude than the ones I had seen elsewhere on Aerb, but artfully designed all the same, as though someone had been trying to make something pretty without the tools necessary to do so. I wondered whether it was simply from another era and hadn’t been replaced, since the tower itself seemed incredibly old.

“We’re going up,” said the Abswifth, more to the people at their desks than to us. He unslung his enormous sword from his shoulder and set it into a rack by the front entrance, then strode toward the elevator without looking to see whether we were following behind him. Fenn shot me a glance, and I shrugged. If we’d had the teleportation key, this might have been the point where I’d simply left
rather than get to the punchline, but we didn’t really have many options. I took it for granted that the Abswifth was stronger than us, not to mention fast enough to chase us down. Besides, we needed information, and he had it.

The door of the elevator was a foldable metal one, leaving large diamond shapes that we could see out of as it rose. The Abswifth stood behind us, and while Fenn elected to face him, I tried to pay attention to what I could see on the various floors we passed. I saw more desks, these without people, a room with rows of books, a place for storage and filing cabinets, but what was more interesting than what I saw was what I didn’t see. There were no rooms devoted to living, no kitchens, bathrooms, couches, comfortable chairs, nothing like a break room, and certainly no beds. This tower, then, was a place of business and function, almost religiously so.

But after six floors of that, we passed into a different part of the tower, one where there were no rooms at all, only a drop that quickly became frighteningly far, down to the ceiling of the sixth floor below. When I leaned forward to the grate and looked up, I could see our presumptive destination, far above us, barely lit by the tower’s few small interior windows.

“I’d like some answers,” I said.

“When we get to the top,” replied the Abswifth.

There was a minute amount of motion that came with being at the top of a skyscraper, and sometimes gave people “sky sickness”, a counterpart to sea sickness. My dad got it bad, and talked about it often, because he thought it was hilarious, in a dry humor kind of way. He was a helicopter pilot, comfortable with all sorts of terrible turbulence and choppy rides, but if you put him in a tall enough building he would start to get green about the gills. I had never gotten the same way, but it was something that I thought about when I got high up. Sorian’s castle had it, just a bit, though I was distracted first by the threats on my life, and second by being shot. Aumann’s tower definitely had a little bit of that sway, though it wasn’t even all that tall, but I had been distracted by the people trying to kill us. (In retrospect, the taller buildings of Aerb hadn’t really been good experiences for me.)

The needle-thin tower had none of that. It was stable as a rock, no more subject to minute amounts of sway than a post driven into the ground. Whatever the tower was made of, it wasn’t budging at all. I wasn’t actually sure that I would have noticed that if I hadn’t been preparing myself for it. This was all the more impressive given the faint howl of wind I could hear outside and the absurdity of the tower’s design. From what I had seen, the walls weren’t more than a foot thick, and there were no internal supports, meaning that it was literally just a tube of some incredibly strong white material. In other words, the whole place reeked of magic.

The upper floor was much the same as the lower ones, made of thick wooden beams that seemed, from below, to not actually have any supports. The interior was decorated with furniture that seemed extraordinarily heavy and solid, especially given how far up we were and how much of a pain it must have been to get it here. The elevator didn’t seem like it would have been wide enough to accommodate the desk or chairs on their way up. A wide screen partitioned the room, behind which I could see the corner of a well-made bed, the first and only sign that this tower was a place that was lived in, rather than just a place of work or business. Above us, the ceilings rose to the very top of the needle-point tower, where eight windows wide enough to fit a person let in a large amount of light.

I didn’t really pay that much attention to any of that; my eyes were drawn to the notification I’d gotten as the elevator glided to a stop.

Affliction: Goodly!
“We’re not killing a baby,” said Tiff.

“You know, I’m actually surprised that it would take Joon so long to spring the ‘evil baby’ thing on you,” said Reimer. “He’s grown soft in his old age.”

“It’s an evil baby,” said Arthur, “You have to kill evil babies. You’d kill baby Hitler, right?”

“No?” said Tiff, more as a question. “Assuming that I have access to baby Hitler, I can just kidnap him and raise him not to be evil. Most of him being an authoritarian fascist probably traces back to his experiences in the trenches of--”

“Okay, pretend that your options are either killing baby Hitler or leaving everything how it is,” said Arthur.

“But it’s complicated,” Tiff complained. “I personally think that World War II happens anyway, just not in the same way, and if it happens after the invention of nuclear weapons, then,” Arthur opened his mouth to interject, “Yes, I know, I’m saying that it’s possible that we live in the better timeline, and you want to know whether I expect it to be better on average, and what I’m saying is that I don’t know what the impacts would be. I don’t really subscribe to the ‘great man’ theory of history, it’s all structural forces and background effects, so … no, I don’t kill baby Hitler. And I don’t think that we should kill this demon baby.”

“Classic mistake,” said Reimer, shaking his head.

“It’s the lawful good way,” said Arthur with a nod.

“It’s not actually a demon,” I muttered. It was a penadran, a custom creature that they’d spent the evening slaughtering their way through, more like a spider-dragon than it was a demon.

“I don’t think that’s lawful good,” said Tiff. “I’m not saying ‘don’t kill baby Hitler because there are laws against that kind of thing’, I’m saying don’t do it because it’s not the right thing to do.”

“So, good or chaotic good,” said Tom.

“The alignment system is braindead anyway,” said Reimer. “That’s why they got rid of it in 5E.”

“They didn’t get rid of it,” I replied.

“It’s gone in every way that matters,” said Reimer with a wave of his hand. “In 5E it’s just flavor, but here,” he said, jabbing his 3.5 edition character sheet, “It’s an actual, concrete thing. There are spells that detect it or protect from it. We could literally do the baby Hitler test, if we had a D&D time machine, and the universe would get us a definitive answer on whether or not that was an evil act.”

“Isn’t that a god thing?” asked Tom.

“No,” replied Arthur. “Gods only come into it where paladins are involved, and a few other corner cases. Reimer is right, at least within the context of the game.”

“So there’s an objective right answer to whether killing this baby demon is good, neutral, or evil?” Tiff asked, turning toward me.

“Technically, yes,” I said.

Tiff frowned. “Well that’s dumb.”
The effect, Goodly, wasn’t something that I could actually feel, and without the notification from the game, I wouldn’t have known it was there. I followed after the Abswifth as he went to sit down at his large desk, trying to think things over, and took a seat in one of the large chairs. Fenn sat beside me, crossing one leg over the other and resting her black-gloved hands on her knees in a mock-prim pose.

“Last night we were anonymously informed that an unregistered soul mage was set to visit Parsmont,” said the Abswifth. “We were given descriptions of four individuals, two of which are a match for the two of you. Further, we were given the glyph sequence, make, and model for a car that we were told would be approaching from the south-east, which matches the car you were seen entering the city in.” Fucking Fallatehr.

“Huh,” said Fenn, glancing at me. “And is there any reason that you felt compelled to believe any of this?”

“Frankly, I’m skeptical,” said the Abswifth. “However, the seriousness and specificity of the claims meant that some amount of investigation was warranted. You were watched by a warder for a brief period of time, long enough to confirm that the two of you hold numerous magic items, which raises the credibility of the report.”

“How would you know whether I was a soul mage one way or another?” I asked.

“We have a specialist, who will be meeting with you,” said the Abswifth. “I’ll be asking a few questions while he makes his way over.” He pulled a pen from on his desk and slid a piece of paper in front of him. The whole thing was surprisingly mundane, for a man in shining armor who supposedly had the power of a demigod. Aside from him dropping from the sky, I didn’t really know his abilities, but I wasn’t about to ask for a demonstration. “What are your names?” he asked.

“Are we under arrest?” asked Fenn.

“Technically, no,” replied the Abswifth without blinking. “You are in my custody for a duration of up to one week, with lodging and food provided to you by the city of Parsmont. At the end of one week, or sometime before that, at my discretion, you will be released, unless I bring charges against you. Despite your reticence in coming with me, I don’t intend to bring any charges against you, nor do I plan to exercise my right to extend custody to the full week.” He said this all in an even, practiced tone, which made him sound like a diligent civil servant, and almost made me like him.

“What would be the consequences if I were an unregistered soul mage?” I asked.

The Abswifth hesitated with his pen over the paper. “Are you?” he asked.

I was paying attention to my thought processes as he answered the question, trying my best to figure out whether the answers that I was going to give him were diverging from the answers that I would have given before having entered this room and gotten the status effect, whatever it was. I found myself wanting to tell him the truth, and found, on reflection, that the truth probably wasn’t what I would have given him if he had asked when we were going up in the elevator. And why did I want to tell him the truth? He seemed decent enough, he had the weight of Parsmont behind him, he was being kind when he didn’t have to be -- no, there were cynical explanations for his behavior too, but for some reason I didn’t want to jump to them, and that seemed unlike me.

“No, I’m not a soul mage, registered or otherwise,” I answered. I felt bad for lying to him, but I didn’t know anything about him, and besides that, this was a test, to see whether or not ‘Goodly’ allowed me to lie, or whether I was under some kind of zone of truth or Veritaserum type of deal (a terrifying and world-warping magic that showed up a lot in both tabletop games and Earth fiction,
but which Amaryllis hadn’t seemed to think existed). The lie went through easily enough, which answered that question. I didn’t want to lie, but I could.

The Abswifth frowned at me, then wrote down the answer on his paper. “And what are your names?”

“Samuel Sterling,” I said, another lie I had to consciously think about, which came with a skill up notification that I kept myself from reacting to. It was possible that the mystery informant had given another name, but I wasn’t going to sweat that.

(The problem was that the wanting didn’t come from nowhere, there was a train of thought that led up to it. Telling the truth seemed like the best way forward, the way that would get me the results that I wanted. I could feel faith in the goodness of people where no such feeling had been before, and when I questioned that faith, I felt myself thinking that even if others wouldn’t commit to that same level of disclosure, I should be an exemplar of truth, because without someone to step forward, the whole world might get caught in a circular firing squad of defection from good. The only reason to lie was that this was what I would have done before coming into this room -- and, in fact, had planned to do well beforehand.)

“Eliana Sterling,” said Fenn, with only a brief glance in my direction. “We’re not going to be put on some ledger somewhere, never to escape the wandering eye of the bureaucrats, are we?” she asked. The worry in her voice was amazing, the perfect picture of someone who was more concerned about an ongoing bureaucratic nightmare than having done anything wrong. She was far better at lying than I was.

“There will be a record of this meeting, for the purposes of accountability,” said the Abswifth. “It won’t go into general circulation, nor will it be available to the police of Parsmont, unless there’s something that they need to see. Again, I’d like to let the both of you know that I have no plans to bring charges against you, even for minor crimes I might discover in the course of this interview.”

“Why not?” I asked, furrowing my brow.

“It’s in the interests of Parsmont that people are willing to come in for questioning,” said the Abswifth. “There are cities and countries in which the police will slap every fine and penalty they can think of against someone who does not cooperate, as a way of strong-arming people into giving up names or information, or simply to fill the coffers. I don’t believe that to be sound in the long term, nor do I believe it to be Good.” He said the last word like good was some concrete, physical thing.

“You never answered the question of what would happen to me if I were an unregistered soul mage,” I said.

“And you’re not?” asked the Abswifth.

“No,” I replied. I think the lie came out better that time, and I got another skill-up for it, which still left me far below the bonus that I was getting from Fenn’s Symbiosis passive. “I’m worried that whatever method you’re going to use to determine whether I’m a soul mage is going to be wrong, which would leave me without a way to contest it.”

“There are multiple levels of screening,” said the Abswifth. “Not all of them have the potential for error. At a certain level, you would be extradited into the custody of the Empire of Common Cause, at which point I would have no authority over the situation.”

“Just for my own understanding,” I said, “Do you know what happens to unregistered soul mages,
once they’re in the clutches of the Empire?”

“I’m not an expert, by any means,” said the Abswifth. “You will be granted counsel, in the event that you’re lying to me and you fail the screening tests, or if you fail the screening tests for some unforeseen reason. The traditional penalty is death, but it’s my understanding that this is often waived in lieu of forfeiture of talent, especially if there’s cooperation on the part of the mage in uncovering where the unauthorized learning came from.”

“I see,” I replied, feeling my blood run cold. The Abswifth might be polite, and he seemed like a decent enough person, but my life was on the line, especially because the only information I had to give up would lead back to Fallatehr, and I was fairly sure that I wouldn’t get any slack for giving him up, given that I had broken him out of prison. I tried to think about the different tacks I might take to get out of this situation, but I didn’t know what kind of specialist they were calling in for the first screening, nor what kind of magic that specialist would be working in order to diagnose me. There were lines of argument that I didn’t think would work, especially given that I had no idea how close Parsmont’s legal system was to America’s.

“Why did you come to Parsmont?” asked the Abswifth. He was making an effort to smile, which I normally would have taken as manipulation. Instead, I felt like it was probably him attempting to lighten a somewhat tense situation.

“We thought that it would be a place welcoming to strangers,” I said. “It’s somewhat famous for that.”

“Ironic, eh?” Fenn added. I was fairly sure that she was under the same effect I was, but she seemed to be handling it just fine. She hadn’t had forewarning like I did, but she was at least following my lead.

“Yet you arrived in the city by car,” said the Abswifth, “Not by train, not by teleportation key, but by car, and a car that’s registered within the city-state.”

“We were staying at a farmhouse in the country,” I replied. “The car belonged to the people that owned it, until a few days ago, when we bought it from them.” The truth was easier, as a general rule, especially since I thought they would probably have records that they could check against.

“And how did you get to that farmhouse?” asked the Abswifth.

“We drove,” I replied. “Up the Golden Highway, following the Pellmance River. Since you’re going to ask, our origin was Calhaim, but before that, we were in Anglecynn.” I watched as he wrote all that down and hoped that the map I’d looked at wasn’t too out of date. I was starting to form a plan, but I wasn’t sure it was a good one, and I kept having to check my logic against what I thought I would have done before coming into this room and being influenced by (presumably) an arbitrary definition of good forced on me by the tower.

“You changed cars, when you arrived to the farmhouse?” asked the Abswifth, his pen still moving across the page.

“Yes,” I replied.

“And the two others that were with you, they’re at that farmhouse now?” he asked.

“No,” I replied. “They went somewhere else. I don’t know exactly where.” I hesitated, trying to go through my line of thinking again, weighing what his reaction might be. “One of them is a dwarf, originally from the clan of Darili Irid, no one of much importance. The other is Princess Amaryllis
Penndraig, the closest direct descendant of Uther Penndraig and a recent political exile from her home country. I would like to formally request asylum on her behalf.”

“Well, that’s pretty ballsy, I’ll give you that,” muttered Fenn.

The Abswifth eyed me. “I see,” he said. “Obviously that would create a great deal of complications for Parsmont,” he said. “The Empire of Common Cause would have to be involved, and it’s always been the policy of Parsmont to keep their involvement to a minimum, where possible.” He tapped his pen on the paper as he watched me. I noted that his pen had stopped moving when I’d said Amaryllis’ name, which I took as a good sign. “Were you planning on requesting asylum before coming to this tower?”

“No,” I replied. “If you hadn’t stopped us in the street, we probably would have used Parsmont as a waystation. However, I’m her primary protection, and if I’m going to be detained for up to a week—”

“It’s blackmail then,” said the Abswifth, setting down his pen. “You’re blackmailing me, in the Tower of Probity.”

“It’s not blackmail,” I said carefully. “The princess is in danger, real danger, which we could better handle by staying as hidden as possible. Failing that, it is imperative that she be protected by as strong a governmental apparatus as possible, and in this case, that means the city-state of Parsmont, which will need to interface with the Empire of Common Cause. That’s not blackmail, to state what I see as my options.”

I knew that I was threatening him with a political nightmare, given that Parsmont had always had a somewhat tenuous relationship with the Empire, which was one of the reasons that we had come here. The only real question was whether his response would be to throw the princess to the wolves, but I couldn’t imagine that being popular, which was something he was worried about, and it wasn’t like I was offering her up.

I felt bad for the Abswifth, because it didn’t seem like he deserved it. There were people outside the walls around the tower, protesting against him, and others who were willing to throw their vote my way without knowing anything about me except that I was in opposition to him. And why? My guess was that it was the vote and the tribalism that came with it. The fact that the city pitted its two rulers against each other was bound to result in something like this. I wasn’t certain that the other tower radiated evil, but if it did, that explained a fair amount of the tension between the Abswifth and the Bendon.

“You’ve put me in a difficult position,” said the Abswifth. “And at times like this, I always feel the need to reflect on what is best for Parsmont.” Well, shit. “It would not do for this city to get wrapped up in an international struggle, not even a brief one that saw your princess transferred to another willing country for more permanent asylum. Nor would it do for the Abswifth to ignore a warning because it was politically convenient, especially not if there were publically available information to that effect.”

I paused. “Ah. You’re worried that we wouldn’t keep our mouths shut.”

“Someone informed on you, whether you’re an unregistered soul mage or not,” said the Abswifth. “If I were to let you go without further inquiries, because I viewed that as being in the best interests of Parsmont, what do you think would happen next?”

“They’d talk to the press, or maybe the Bendon,” I replied. “And if they did, some kind of accusations would be thrown around, which would result in either you having to lie, which is morally indefensible—” I caught myself, but in catching myself, realized that was a mistake. “Which
carries its own costs to you, and therefore Parsmont.”

“You’ve noticed the tower’s effects,” said the Abswifth. “You were lying about soul magic, and possibly also about where you came from. Maybe even about your names. If the tower were in its prime, you wouldn’t have been able to resist -- but alas.” He shifted his papers around, looking over the notes he had taken. “The effects of the tower are a poorly-kept secret, and one whose effects are often overstated. However, it works better on the evil than the good, and I am sorely tempted to count your ability in navigating the tower’s compulsions in your favor.” He looked up at us.

“But?” I asked.

“I’m given to understand that soul mages are capable of eradicating their own ability in the art,” said the Abswifth. He tapped his pen against the paper in front of him. “I believe it would allow you to pass the first screening, or perhaps the second, in perhaps two hours’ time, after which you would be free to leave.”

“You’re asking him to erase a part of himself,” said Fenn.

“The tower does not look kindly on it,” nodded the Abswifth. I could feel that, an instinctive recoiling within myself at the idea, but it was faint, almost non-existent, because soul magic wasn’t actually a part of me. “But no, I am not asking anything, only, as you said, stating what I see as your options. I don’t know for certain whether you’re a soul mage or not, but if there are only lingering indications that you once practiced soul magic, that would be enough for me to allow you to leave. It would, naturally, be in your best interests to leave Parsmont with all due haste.”

“Okay,” I nodded, breathing a slight sigh of relief. I didn’t actually know how to reduce a skill, but I was sure as hell going to try to figure it out within the next few hours. My chest still wasn’t fixed, and I wasn’t going to give up soul magic, obviously, but resetting back to zero, if I could manage that, was a setback that would be measured in hours, not the years that the Abswifth thought. “Thank you for being forthright, and I’m sorry for the problems we might have caused.”

“I’m going to take a nap,” I said, then closed my eyes and shut out the world.

I didn’t like meddling with my soul. I hadn’t liked it even before coming into the tower, but the Goodly effect seemed to be exerting some power, at least insofar as I was capable of comparing how I had thought about soul magic before. I was thankful that I was a somewhat introspective person, which made that part of this a little bit easier.

I went into the Essentialism skill right away, but there didn’t seem to be any kind of mechanism available to lower the skill. I knew there was at least one sure-fire way to do it, which would be to remove the skill entirely, but I had a limited number of skill changes available to me under the most liberal reading of the rules, and I wasn’t confident that the liberal reading was the right one, so I had to put an asterisk next to ‘sure-fire’. Essentialism was slowly ticking up though, which meant that it might just be a matter of time and practice before I was able to access new abilities. Level 10 of Essentialism hadn’t given me a virtue (something I had to annoyingly go out of the soul to check, given that the soul didn’t seem to have them listed anywhere), which meant that I was almost certainly going to get one at level 20.

I moved away from the floating rows of skills, toward my values, at the one labeled ‘Level Up’. I had been putting this off, for fear of touching and breaking something in my soul in a way that I couldn’t easily undo, but I had managed to repair my hand, and I was feeling a little more confident. My biggest worry in changing the value was that I didn’t actually know what ‘Level Up’ meant, in a concrete sense.
Obviously I valued the ever-increasing feeling of transcendental joy that accompanied the level ups, but each one also raised the caps on my skills in addition to making me into a better version of myself. Were both of those things part of the listed value? The value didn’t seem to point anywhere, or have a definition of ‘Level Up’, at least so far as I could see. If it did encompass both those aspects, then it was also possible that it was linked to a few other, less obvious ones. Leveling up was a path to power, and maybe the values were taking that into account. The more I leveled up, the more likely I was to see Arthur again.

I didn’t feel like an addict. Amaryllis agreed that increasing my power was the smartest thing that we could be doing. Was there an argument to be made that I really should be valuing leveling up above everything else? I thought there likely was, but it was a weak argument, given that there weren’t a cluster of other values sitting up there with the people that were important to me. I didn’t even value my own life that highly.

I was stalling. I could feel myself stalling. Part of it was the idea that my soul was a sacred thing that would doom me forever if I meddled with it, which I was sure was just the tower talking given that I didn’t really hold anything as sacred, and had meddled with my soul earlier in the day. But another part of the hesitation was the knowledge that lowering the value marked ‘Level Up’ might mean that I wouldn’t get to level up as quickly, that I might stall and contemplate when the time came to complete a quest, or exercise caution in a way that would delay the next blast of pleasure as warm light enveloped me.

I shifted the number down as soon as I was able to work up the will to do it, and it got easier as I went. My view of the values was pegged to ‘Level Up’, so I saw it slide past other values as I reduced it, past all of my high school friends, past fandoms, beyond memories I cherished so much they were explicitly named. I stopped when it was between ‘Mint Chocolate Chip Ice Cream’ and ‘The Chronicles of Narnia’, and watched it carefully.

It ticked upward, moving so it was just below ‘Mountain Rush’, which was Shasta’s knock-off version of Mountain Dew, and after what felt like a minute (but might have been more, given how time seemed to get lost in the soul) ticked up again, placing it below ‘Arkwell’s Fantasium’, a book I hadn’t finished. Its progress was slow, and the values here were small ones, fine-grained and plentiful, but it was still going up, inexorably.

Obviously that was a problem, but it confirmed something that Fallatehr had said. Changes would revert, given time. I could lower the value of ‘Level Up’, but even with it lowered, I could still remember how it had felt. I suspected that Fallatehr wasn’t telling the whole truth, and that there were methods of alteration that would leave someone in a stable state that wouldn’t revert, because it was possible to look at and presumably alter memories, even if the interface for that seemed lacking. Even then, there might be other parts of the soul that would need to be changed, unless the soul itself didn’t actually contain everything there was that made up a person. Still, I had a solution that I could re-apply at regular intervals, which was another weight off my shoulders.

I took a brief moment to remember that I had a body out there, with muted sensations coming from it, but that was practically old-hat by now, and I was in the same position I had been in when I started. I could hear conversation, but only enough to know that it was going on, and even then it slipped away, lost on its way to me. Fenn was talking to the Abswith, and I had to trust her to do the talking, even under the influence, if I wanted the escape the Abswith had offered me.

I was pleased to see Essentialism hovering at 19, and even more pleased when the number switched over to 20. It seemed like a shame to lose all that progress, but at least Essentialism was easier to hit the soft cap on than some of the others. I backed away from the skill and began looking for obvious changes, though I was going to have to leave the soul entirely to see what the virtue was. I found the
change readily enough though; beside my body (as seen by my soul) were thirteen numbers, each with a three-letter signifier by it. Even without checking, I could feel that there was some give to them; these were my abilities, PHY, MEN, SOC, now here in the second character sheet, but this time, alterable.

I blinked back into the real world (such as it was) and looked from Fenn to the Abswifth, who were both looking at me.

“It’s done?” asked the Abswifth.

“Not just yet,” I replied, closing my eyes. “Do we have time?” I asked as I waited for the character sheet to come up.

“A little,” replied the Abswifth.

The new virtue was called ‘Soul Slip’, and the description was fairly vague. All it said was that I would be able to make new modifications and trade-offs within the soul, and alter that which had been unalterable, which wasn’t very helpful at all, given how expansive the soul was. I opened my eyes and looked at the Abswifth again.

“I’m going to take another nap,” I said.

I was faster this time, zeroing in on the Essentialism skill. This time the option was there right away, not a visible bit of text or a button to press, but a notional control that presented itself to me when I looked at the number. I stared at it for a moment, trying to think about whether there was anything that I would want to do before setting myself back by twenty levels.

I wondered whether this was all part of the plan, either by Fallatehr or the Dungeon Master. It wasn’t quite outrageous to think that Fallatehr would implicate me as a soul mage, hoping that the end result would be that I would remove the ability from myself to avoid implication and reset all my progress in the meantime. There were variables that he had no control over, and information that he wouldn’t have had access to, but those were dice he might have rolled. I still couldn’t see the endgame for him, unless he was hoping that I would damage my soul in such a way that only he could fix. At most, it would take me two days to get back where I had been, and I doubted it would even take that long.

I followed the lines to Amaryllis and Fenn, giving each of them a quick check, just to make sure that nothing was out of place. I spent more time on Amaryllis, because she was in the most danger, and with soul magic temporarily gone, it would take some time before I could check on her again.

Everything seemed fine though, at least as far as I could tell. When I looked at Fenn I saw that name, Nellan, again and felt a slight stab of jealousy, but her soul had not noticeably changed, even with the effects of the tower upon us.

I went back to my own soul and pushed Essentialism down to zero, all in a single motion, worried that if I tried to do it in measured steps I would lose the ability to do it at all. When the motion was complete, I found myself back in the real world, staring at the Abswifth.

“The specialist will be arriving shortly,” said the Abswifth. “If you are a soul mage, the nature of my help will by necessity be quite different, and I must again offer the warning that my power does not extend far beyond Parsmont.”

“We’ll see what the specialist has to say,” I replied.

As if on cue, the elevator began to move.
The inspection took half an hour, during which the Abswifth sat silently and watched. My inspector was a tall lizardfolk, with pupils that blobbed out in three directions and seemed to spin whenever he squinted, which was often. I was surprised that the Abswifth was willing to spend so much time with Fenn and I, given the importance of his position, but I supposed the situation was a delicate one, and given the reaction I’d seen people give him as we moved through the streets, I couldn’t say that I would blame him for wanting a bit of time in relative solitude at the top of the tower.

“He was a soul mage, once,” said the lizardman, with his forked tongue snaking from his mouth. “He has no skill, at the moment.”

“You’re sure?” asked the Abswifth.

“Sure, for now,” said the lizardman.

“Thank you,” said the Abswifth with a curt nod. “That comports with their official story.”

“There is something else,” said the lizardman. “He is a mage, four times over, of some skill.”

The Abswifth frowned. “His race is human?”

“Yes, and always has been,” replied the lizardman. “His age is seventeen.”

The Abswifth nodded. “Thank you, you may leave.”

The lizardman gave each of us a bow, so deep his nose almost touched the floor, then trundled back toward the elevator. I wondered what he got paid for a service like that, but I bet that it was exorbitant.

“I have questions,” said the Abswifth. “But they are ones that I feel I would probably be better off not knowing the answers to, for your safety, mine, and for the people of Parsmont.” He placed his hands on the table and stood up, which let a ray of light hit his shining armor in a way that I was ready to believe he’d practiced. “This business is concluded,” he said. “The anonymous report we were given was obviously based on false information, and you have, as yet, threatened no harm to the city of Parsmont. That is where we will leave it. The sooner you leave the city, the better. If the people who gave us that anonymous tip give us another, there will be less consideration for your circumstances on my part.”

“May we never meet again,” said Fenn with a nod. I couldn’t help but see that as tempting fate.
“Well that was fucking horrifying,” said Fenn as we walked through the plaza outside the tower.

“What part?” I asked, raising an eyebrow. I’d basically been threatened with death, but the Abswift had seemed reasonable enough. “Did he say something to you while I was under? Actually, we should probably hold off until we’re somewhere private, if he was to be believed about lip readers and eavesdroppers.”

Fenn frowned, looking at the gates, and the crowds beyond them. “We’re leaving Parsmont?” she asked. “This whole adventure has put us well behind schedule. Mary’s probably worried sick.”

“We’re leaving,” I nodded, glancing at the black tower, not all that far away from us. “I’m worried that the other shoe is going to drop before we do, but we’ll try our best to escape. We’re going to have to abandon the car, since they had eyes on us from the moment we came to town, and they had the better part of three hours—”

“Four hours,” said Fenn.

“More than enough time to do whatever they wanted with the car,” I said. “I don’t really know the state of surveillance devices in this neck of the woods, but I’m not going to bet against them being small enough to hide in the car, or on our ability to find them, considering that I know nothing about cars.”

“I might have something at the end of my sleeve,” said Fenn, wiggling her gloved fingers.

Guards opened the gates for us, and then it was an uncomfortable press of people, many of them asking questions. I answered the first of those questions with, “No comment” and then that became my litany as Fenn and I moved away from the tower. Only a few of them followed us, and even then, not for too long, though we had our pictures taken a few more times, which I didn’t enjoy in the slightest. Eventually they lost interest, and we slipped into side alleys a few times, trying to make sure that we didn’t have a tail, though that wasn’t an area of expertise for either of us.

“So what’s the plan?” I asked Fenn as soon as we thought we were clear. She’d changed hats, and pulled out light coats for both of us to wear, changing our appearance just enough that we might seem like different people on casual observation.

“Oh no,” said Fenn. “Don’t you put planning on me, you’re the one that’s got all the planning duties in this relationship, I’m just along for the ride, and to shoot things when they bother you.”

“I meant, what did you have in your glove that we could use instead of a car?” I asked as we approached the outskirts of the city, where the roads were wider. We had at least half an hour to get back to where Mary and Grak were going to be waiting for us, if they were still there. I wasn’t sure whether she would stay put or move, once we failed to show up. The plan was for our trip into Parsmont to not take longer than three hours, including the travel time, meaning that by the time we reached them, we’d be a few hours overdue. Amaryllis had a streak of pragmatic paranoia to her, but I didn’t actually know what her response would be.

Fenn held out her hand, fingers spread, and a very familiar-looking motorcycle appeared in front of us, its tank made of glass and full of souls.

“XC-class soulcycle?” I asked, staring at it.
“That’s what Mary said,” replied Fenn. “I stole it back in Cranberry Bay, Mary bypassed the ignition when we were still in the bottle.”

“Huh,” I said. “Just the one?” I resisted the urge to ask her how long she’d been sitting on this particular asset, which might have come out as accusatory. *Unspoken plans, made without me.*

“Crime of opportunity,” replied Fenn, seeming to misunderstand the nature of my question. “We’ve got the money to buy more of them, if we really wanted to burn the resources.”

“No, it’s fine,” I replied. “We can’t pick up Mary and Grak in that thing, but they’ll have, ah, other means of conveyance, if they’re where we left them.”

“Except she won’t want to use it, because it’s our ‘most valuable asset,’” replied Fenn, hopping onto the soulcycle. “You’re fine with my driving?”

“Lead the way,” I replied, slipping into the seat behind her and wrapping my arms around her waist.

The soulcycle that Amaryllis and I had gone through the Risen Lands with had seven souls in the tank, and didn’t move all that fast. This one was full-up, and Fenn was pushing it nearly to its limits, weaving in and out of traffic. She might have stolen the soulcycle for us, but she hadn’t stolen helmets, or if she had, she hadn’t offered them up. We slipped through traffic, sometimes splitting lanes, until I finally tapped her on the shoulder when we were still a few miles from the woods we’d dropped Amaryllis and Grak off at.

“What’s up?” she asked as she pulled over to the shoulder. I got off the soulcycle, and she followed suit, stretching out in a way that I found unexpectedly alluring.

“I’ve been thinking,” I said. “We’re late, and late enough that more time probably isn’t going to make the difference. I still have soul magic unlocked, which means that I should still be able to get into my soul, but the skill is at zero, which means that I’m a bit hampered. Here, now, while we have the time, I’d like to level it up a bit, and then check on Amaryllis so that I don’t have to find some excuse to do it if or when we meet up with her, because Grak still doesn’t know about the soul link.”

“I would have agreed with far fewer words on your part,” said Fenn. “Take whatever time you need, my big worry is running out of daylight, and I can just slap you if that starts to be an issue.”

“You’re so lovely,” I replied with a smile.

Fenn grinned at me. “You still owe me that date, don’t think that going up a terrifying white tower counts.”

“Terrifying?” I asked. “I didn’t think it was that bad.”

“Yeah,” said Fenn, looking away. “I’ve been thinking about that, a bit, what you said earlier, the confusion on your face.” She swallowed. “From what I gathered, the tower made us good, didn’t it?”

“Kind of,” I shrugged. “Maybe it’s more like it nudged our thoughts in one direction.”

“I hated myself,” said Fenn, still looking away from me. “Not me as I was in the moment, up there in the tower with you, but the person I was in the past. I kept thinking about the person I’d been, things I’d stolen, people I’d killed, thoughts I’d had, and it just … filled me with this disgust and horror.” I slipped closer to her, and held her hand, which she responded to by stepping in toward me and giving me a kiss on the lips. “It was a real slap to the face, I’ll tell you that -- when I was working my way through the justice system of Anglecynn, before I got sent to prison, I’d always felt this
contempt for the way people looked at me, the pity of the judges, the condescension of the lawyers, even my own lawyer, the guards, the clerks, I’d always gotten some looks for being half-elf, I’ve been spat on more times than I can count—"

“Spat on?” I asked. “I’m going to claim some cultural ignorance here, but that seems -- well, like people are fucking assholes.”

“Okay, spat on three times, I actually can count those, but spat at more than I can count, usually they’re just spitting toward the ground, it’s -- not the point, at all,” she said. “The point is, going through the system, and being in jail, there was this specific way that people looked at me, like I was a bad person, and I thought they were just smelling their own farts, you know?”

I laughed at that, and she gave me a smile that faded quickly.

“Up there in that tower, I understood them. I empathized with them. I was them, I was like this outside observer looking back over my own life and thinking, ‘holy shit, I’m a bad person’. You were doing most of the talking, and I was trying to follow your lead, but once I started down memory lane it seemed like every stop I made I was just … evil.” She breathed a sigh. “And a part of me didn’t want to leave the tower, because I thought I would just return to being evil again, so I had to make up my mind then and there that I would commit myself to the path of good, instead of being evil, but it slipped away even as we were going down the elevator.”

“You’re not evil,” I said. “I’d call you chaotic neutral, maybe.”

“That’s a D&D thing?” she asked.

“Yeah,” I replied.

“Well,” said Fenn, plowing on. “The thing I was thinking about as we were driving was, you didn’t seem to feel the same way, and I realized that you’re probably just a better person than I am, with less to answer for.”

“I’ll be honest,” I replied.

“See?” interrupted Fenn. “Already showing that you’re good.”

I shook my head. “I just wasn’t really thinking about the past,” I replied. “I’ve got stuff to answer for, maybe not as serious as you do, but back on Earth, by the standards of the town I lived in, I … yeah, I was bad, especially after,” I licked my lips. “After Arthur. I was mean, I hurt people, not just in the way I destroyed all my friendships, but actually, physically hurt people because I thought it would feel good, and it did feel good.” I looked down at my hands, remembering how much my knuckles had hurt as I sat in the police station after having attacked Victor Clark. “But I didn’t think about any of that in the tower, which I think is why I didn’t experience what you did, and even if I had … I’m not really that person anymore. I mean even before I came to Aerb, I’d more or less hit rock bottom and was starting to claw my way back, like I’d gotten the evil out of my system, and that feeling of hating myself and feeling disgust at what I’d done, thinking it was evil -- I’ve felt that way for a while, it wouldn’t have been new.”

“And the things you’ve done on Aerb?” asked Fenn. “Aumann and his people? Hell, we killed Fireteam Blackheart together, you dropped half of them down an elevator shaft, and even before you got to Silmar City, you and Amaryllis left a trail of bodies. It was kill or be killed, I get that, but …” She stopped. “I’m not saying that you’re a bad person.” She looked toward the sun and frowned. “I’m sorry, I don’t want you to feel like I’m attacking you, but I just don’t really get how to reconcile our different experiences of the tower. And we don’t really have time for that.”
“You’re right, I need to be grinding Essentialism back up,” I replied. “But … I think I know the answer to why our experiences were different.”

“Because I’m evil?” asked Fenn with a forced laugh.

“The interesting thing about the Tower of Good wasn’t that it made us think good thoughts or whatever, it was that it attached lines of thought to them,” I replied. “I wasn’t just thinking that I shouldn’t lie, I was thinking about the reasons behind it, which were different from what I would have come up with on my own. It wasn’t just morals, it was some kind of moral framework, including at least some small amount of reasoning behind it.”

Fenn frowned. “So the difference between us--”

“I’m a utilitarian,” I replied. “Moral philosophy isn’t my forte, but Arthur liked the subject enough that he set himself to playing devil’s advocate--”

“Playing what?” asked Fenn, her frown deepening.

“Fucking idioms,” I replied. “He liked to argue, maybe more than he ever liked anything else in his life, and that was one of the best things about him, in part because he could come up with some really, really entertaining arguments that he would put a lot of thought into. A lot of the time he argued from a position that he didn’t really agree with -- he thought that was best practice if you wanted to actually understand the world -- and, anyway, he was always pitting himself against me, trying to get me to declare a moral position that he could attack against.” Looking back, it was probably more fun for him than for me, but part of being a friend was working to indulge each other’s eccentricities.

“So you’re saying that you’ve thought a lot about good and evil,” said Fenn, still frowning.

“I’m saying … nothing that the tower was telling me was really new,” I replied. “I’m not a great utilitarian, and maybe I would even say I’m a bad one, but I’ve at least grappled with the questions for long enough to know that’s the thing that makes the most sense to me. So this other way of seeing things comes into my head, temporarily replacing what was there, and there was a dissonance. But for you …” I shrugged. I didn’t want to blame her for being apathetic about right and wrong, but it seemed to me that the tower would get more powerful if it applied its effect against someone who was untested.

“I didn’t have defenses against it,” replied Fenn with a nod, her frown finally vanishing. “Huh.”

“Just a theory,” I replied.

“Yeah, but it makes sense,” she replied. She squared her shoulders. “Okay, that makes me feel a lot better. Go inside your soul and relearn the lessons, then let’s get on the road.”

And that was where I ran into problems.

“It’s been half an hour,” said Fenn, glancing at the sun. “Feels like longer. We might have to just say fuck it and try to get you to reacquire it later on.”

“I should be able to do it,” I replied. “The skill is unlocked and sitting at 0, the character sheet confirms that, unlocked should mean that I’m able to go into my soul and start the leveling process.” I frowned at my hands, which weren’t really part of the process of soul-diving, but definitely were available to frown at. “Do you have pencil and paper in your glove?”
Fenn rolled her eyes, because of course she had pencil and paper in there. She had them in my hands in a hurry, and I bent down next to the soulcycle so that I would have a hard surface.

“Whatcha doing?” asked Fenn.

“Drawing,” I replied, glancing at her briefly for reference. Curve of the throat going to the chin, curve of the chin going to the lips, her nose, cheeks, eyes, quick dots for freckles, hair longer than when we first met, noticeably so -- I stepped back and held up the drawing, looking at it. It was flawed and done in a hurry, with poor materials, but it did look like her, at least a little bit.

“You’re testing your skill,” said Fenn. “Trying to see what’s left when a skill says that it’s been reduced to zero?”

“Yeah,” I replied, frowning at the picture of Fenn. “And obviously I still do have some faculty with it … I was going to say that I retained all the ability I had on Earth, but I was never that great at drawing people. I thought this was going to turn out terribly.”

“And you didn’t think to ask whether I was any good at art?” asked Fenn with a raised eyebrow.

It took a moment for what she was saying to sink in, and when it did, I slapped my forehead.

“Symbiosis,” I said. “I’m an idiot.”

“It’s not something I’ve really brought up,” said Fenn. “Training under the elves, not terribly pleasant.”

“I saw it when I looked at your soul,” I replied. “It wasn’t high enough that I really noted it, you’re good at a lot of things.”

“Why thank you,” said Fenn with a smile. “But whatever you were trying to figure out, I doubt the art thing is helpful.”

“No, it’s not,” I said with a sigh. “It’s like I can remember all the things that Fallatehr said to me about the soul, and I can remember working my way through it, but none of it actually makes sense to me anymore. It was a key that opened the door, and now that key doesn’t work anymore. I don’t even recognize it as a key. That … doesn’t make sense.”

“Fallatehr said that soul mages removed skills from people before they were put into prison, didn’t he?” asked Fenn. “Kind of makes sense that a blood mage couldn’t just think back to all the lessons they took in order to get their power back.”

“It doesn’t make sense though,” I replied. “Memory isn’t actually … Earth memory isn’t this static thing, each time you remember something, you’re remembering the remembrance of it, you’re taking the file out of the filing system and then Xeroxing it before putting it back, but with a Xerox -- it’s a copying machine -- a Xerox that’s imperfect in ways that corrupt sensibly, rather than insensibly.”

“Sure,” replied Fenn, with an arched eyebrow.

“So what’s stopping me from repeating Fallatehr’s lesson to you, and then having you repeat it back to me?” I asked.

“Wanna try it?” asked Fenn. “We’re so far behind schedule I think the biggest worry should be that Amaryllis is going to go back to the farmhouse, not that I think she would do that. I was around for a fair amount of discussion.”

So we tried that. I gave her the metaphor that Fallatehr had given me, of the soul as a comprehensive
book, and she gave me that lesson back, tweaked slightly to her own understanding, and from her own worldview. She thought of the soul as artistry, perhaps because our previous conversation had called that to mind, and to her way of thinking, if you wanted to represent something, there were certain things that you had to have, and others that you could skip over, but it was fractal.

“So, like, the cheek.” said Fenn, pointing to her own cheek, then down at the paper. “What you have here is enough to show the cheek on the face, but it’s not enough to show the cheek by itself, because you’re missing features. Eventually you get down to a level where you’ve said all you needed to say, and the picture you’ve painted is indistinguishable from reality, even though it’s not actually as complex as reality.”

I frowned, because I wasn’t sure that she was actually saying the same thing as Fallatehr said, but his metaphor wasn’t perfect either, and I really wanted to have soul magic back again before we were face to face with the master soul mage.

“Try the meditation thing,” replied Fenn.

And incredibly, it worked. I was back within my soul in a matter of minutes, and when I went over to my skills, I could see Essentialism start silently ticking up again, just from being in my soul. Wary of getting caught by the soul trance twice, I tried to keep the need to leave in my head while going over to my values, adjusting the ‘Level Up’ value back down from where it had risen to, then left my soul once again.

“That shouldn’t have worked,” I said.

“But it did,” replied Fenn. “Isn’t that what’s important?”

“It implies some important things, I think,” I replied. “Reducing a skill doesn’t remove the memories of having learned and used that skill, but it does somehow affect the actual procedural memory, or … something. It’s fucked up. It also means that I can’t use the trick of becoming not a soul mage too many times, which was already a really lame superpower.”

“Superpower is like … the Flash or Spider-Man?” asked Fenn. She had, by necessity, become something of a scholar of pop culture.

“And I’m Captain Not-a-Soul-Mage, endowed with the awesome power of being able to not be a soul mage,” I replied, smiling to myself.

“You are so lucky you’re cute,” replied Fenn. “But if the soul powers are back, then we really should be going, because I’m sure our Mary is lonesome.”

The sun had nearly set, which meant that we were probably going to be driving toward her in the dark, and she would be expecting a car, not a soulcycle. “I didn’t check her, just came right back out, didn’t want to get stuck again,” I said.

“Check her,” replied Fenn. “No use taking chances. If you get stuck, we lose more time, but we’ve already fucked the schedule.”

I did as she said, diving back into my soul, tracing along the line toward Amaryllis, and glancing away from her body to make me feel better about the intrusive act of gazing on her soul. I looked at her values, going through the twenty highest and seeing that they were all as I remembered them, then pulling up a selection of keywords, the ones that I thought Fallatehr would probably use if he had been monkeying around. The big problem was that values seemed to be fractal, some of them containing the others, and if Fallatehr were clever, with enough time, he might be able to hide
something somewhere.

If it were me, I would probably have tried to jigger it so that lots of component Juniper-parts were highly valued, while trying to leave the actual “Juniper” value low, depending on how that worked. There were also controls on the values that could probably be tinkered with, trying to overload one of the numbers in order to cause behaviors that you wouldn’t expect unless you were an expert. Maybe at the height of the Second Empire, when there was a cabal of soul mages, they had established patterns of detection, subversion, counter-subversion, etc., but I was ignorant of what those patterns might be.

It wouldn’t be impossible to partially reconstruct them from scratch though, given that I had access to no less than three souls, but there were issues with that, both ethical and practical. If I tried to figure everything out without actually modifying anything, it might take a really long time to reach any proper conclusion, but --

I felt a slap on my cheek pulled myself out right away, my sword expanding from its ring form to make a blade almost as a matter of habit before I looked at Fenn, who didn’t seem even remotely distressed.

“You were taking a really fucking long time,” she said.

“Sorry,” I said, rubbing my face. “Just a little bit more, slap me if it’s longer than, say, ten minutes.”

“Looking forward to it,” she replied.

So I dove back in, tracing my way to Amaryllis again, this time trying harder to be aware of the muted outside world. I made the rest of my scan, re-confirming her skills, then moving on to social modeling, where I could see her ideas about people. Fallatehr was there, the same as he was in my own soul, a little micro-soul, a model within a model. It was, in part, data about people, but it was also a measure of the prominence of that data, a picture of the way you thought about other people. For Amaryllis, Fallatehr’s potential to betray us loomed large, larger than I would have thought from talking to her, with his skill in essentialism the second most important thing about him, at least from her perspective. She didn’t appear to like him, and even her respect for him was pretty meager. None of that looked like tampering to me.

I was tempted to go looking deeper. There was a social model of me, visible in my periphery, but while there was an argument to be made that Fallatehr might have altered her perception of me, if he’d somehow gotten his hands on her, there was a stronger argument that soul magic didn’t give me the right to go snooping around, especially since there was no turnabout on her part, no ability to read my diary in the way that I would be reading hers. I already felt like reading her like this was an uncomfortably personal affair.

“She’s clean,” I said as I pulled out. “I take that as a good sign.”

Amaryllis was more or less where we’d left her, and less pissed off than I had thought she would be, which is to say that she was still visibly upset. She came out of the woods when we brought the soulcycle to a stop. Now that the sun had fallen, we were pretty conspicuously the only thing on the road.

“You’re late,” she said, looking down at the soulcycle. “Enemy action?”

“Yes,” I replied. I looked from her to Grak. “Things went well on your end?”

“Well enough,” grunted Grak. “The bottle is secure and well-lit. That’s a stop-gap measure.”
“What happened to you?” asked Amaryllis, looking at the soulcycle again with a frown.

“We got picked up by the Abswifth, who wanted to have a talk with us about … me being a soul mage, I guess,” I replied. “We went up the Tower of Probity, suffered through some mildly unpleasant mental fuckery that I wasn’t informed existed on Aerb, and then I removed my ability to do soul magic so that he could pretend that I was innocent.” I turned to Fenn. “I think that’s more or less it.”

“Where’s the car?” asked Amaryllis.

“Back in Parsmont, for the time being,” replied Fenn. “They could have put a bomb in it while we were indisposed.”

“Or a listening device, or tracking spell, or any number of things we couldn’t have checked,” I added with a shrug. “I’ll volunteer for a stint in the glove if we need to make our getaway by soulcycle, but I’m of the opinion that we could just teleport a few continents away.”

Amaryllis stared at me. “You think it was Fallatehr?” she finally asked.

“It had to have been,” I replied. “He was pretty fucking blatant about it. I’d call it cheeky, but I didn’t find it endearing. This was part of some plan of his, I’m not really sure what, but I don’t intend to find out if I can help it.”

“We can’t just leave him here,” said Amaryllis. She glanced over at Grak, then back to me. “You understand that he’s a powerful, illegal, soul mage who knows our names? That was part of the deal we made with him, so that we would have less of an incentive to defect.”

“Defection has occurred,” I replied with a shrug.

“And the damage he might cause?” asked Grak.

I frowned, trying to think back to the numbers on the values I’d seen in my head, trying to map how long it would take for ‘Level Up’ to reassert itself back at the top. A week? Two? Nothing had changed as far as the Grak situation was concerned. Valencia’s second warning about him had made it more likely that he was compromised, but I didn’t trust her very much, especially not given the fact she’d been speaking to me with a devil’s skills in deception.

“You still don’t trust me,” he said. He stepped back slightly. “That is probably wise on your part, given your information. What I say has merit though.”

“We broke him out, we’re somewhat responsible for him,” I said with a sigh. “‘Somewhat’ being the operative word there. And Valencia is still back there, and--” I wasn’t sure what she’d have gotten up to since I’d left, but I hoped that she was okay. The new version of her scared me, a little bit, but we couldn’t leave her. “Shit. Thoughts on how we approach this?” I paused. “Guns blazing?”

“No,” replied Amaryllis. “We still need him, especially if you don’t have access to your soul magic anymore.” She hesitated, then glanced at Grak, before looking back at me. “It’s gone completely?”

“Yes,” I replied. “For now.” The lie came out quickly and easily, which I guessed had to have been from half of Fenn’s considerable ability in the skill transferring over to me. I almost fucked it up by pausing, so that I could get my bearings and figure out why I’d lied on instinct, but I continued on without stumbling, and without looking at Fenn to see her reaction. “We can find a better teacher than Fallatehr though, one that can get me what I need without us having to watch our backs the entire time.” I looked at Grak. “Our ability to enforce trust is limited, that’s a handicap whether or not he’s actually up to something. That’s especially true now that I’m back to square one.”
Why the lie? It was easy to construct a reason, working backwards; Grak was a potential channel of information to Fallatehr, and if I could give Grak the wrong information, then Fallatehr would get the wrong information, and that might allow me to first confirm whether or not Grak had been turned against me, and second, give us some advantage in a confrontation with Fallatehr.

…but that was post-facto reasoning, not why I’d did it in the moment. Was it something subconscious? Or that my augmented mind rolled a high number somewhere and fed me the idea of lying? I tried not to stare at Amaryllis. I’d been lying to her, was that my original intent or a byproduct of keeping information from Grak?

The problem was, I was really good at creating good-sounding justifications for my actions. It was half of what I’d spent my time doing after Arthur had died, and it had that same feel, of grasping for some way that the thing I’d done for unclear, probably emotional reasons was actually the best possible thing that I could have done in the circumstances.

Shrug away from Tiff when she’s searching for comfort? Well, Arthur was my best friend, and if she felt a fraction of what I was feeling, maybe that would help her understand the pain I was in. Attack a kid at school because they said that Arthur’s death was part of God’s plan? Well, play stupid games, win stupid prizes, people should be punished for saying things like that, for not having an ounce of empathy, for worshipping a god that inflicts pain and death on someone like Arthur as part of some fucked up, unknowable plan. Every friend I’d driven away, every mean thing I’d said, the Fel Seed Incident, Maddie, all of it, there was always a way for me to make myself into a rational actor. Looking back, one of the worst things about that period of my life was that I almost constantly felt like I was right, through all the pain and sorrow that I felt, and inflicted on others, as I flailed around like a wounded animal, I was able to justify it to myself as the only thing that could be done.

It wasn’t a welcome feeling to return to.)

“You’re insistent on the non-anima being part of the group?” asked Amaryllis.

“Her name is Valencia,” I replied with a frown. I couldn’t tell whether she was trying to make a point or had just defaulted to her standard way of thinking. I’d gotten myself scattered and off-balance, which made it harder to think about that kind of thing. “But no, I don’t think that it would be wise to leave her behind. She has utility.”

“Does she?” asked Amaryllis, shifting her position slightly.

“We can discuss it later,” I replied. “I’m pretty sure that we both know where the other stands.” I hadn’t told her about the game glitch, or the new powers that Valencia apparently possessed, but I wasn’t about to do that in front of Grak, not when it seemed like we were about to go back to Fallatehr. I was a bit worried about her making a rash decision based on incomplete information, but had some hope that we had some time.

“So we’re going back to the farmhouse?” asked Grak. “Will we pretend nothing happened?”

“Seems like it,” I replied. I looked over at the soulcycle. “We have two seats, I think that Amaryllis and I should take them,” I said. That would give me some time alone with her. “That would leave Grak and Fenn to travel by glove.”

“I second that motion,” replied Fenn. She gave a short laugh. “Nothing I like better than traveling in a glove, Joon knows that, just me and an oxygen tank, getting to know each other.” She held out her hand, and one of the diver’s masks we’d gotten from the clonal kit appeared in it. She tossed it to Grak, who caught it with a frown.
“I get no vote?” he asked.

“Nope,” replied Fenn. “Even if you did get a vote, it’s three against one. Or two against two, with Joon as the tie breaker.” She glanced at me. “How did you get to be tiebreaker anyway?”

“Wit and charm,” I replied. I couldn’t help but notice that Amaryllis made no comment on the topic of a vote, and I thought back to what Fenn had said when we were first starting out, that she was worried Amaryllis and I would form an ironclad voting bloc. It hadn’t turned out that way, but looking at the dynamics as they stood, the group was starting to seem off-balance. With Valencia in the mix, I worried that it would be even worse.

Grak dutifully put on the mask, then waited patiently while Fenn rested a hand on him, and then he was gone, inside the glove. Fenn took another mask and tank out and put it on. She gave me a short little curtsey and then disappeared, leaving the glove, Sable, to fall to the ground. I picked it up and handed it to Amaryllis, who hesitated for a second before putting it on.

“Was there something you wanted to talk about in private?” she asked.

“Valencia,” I said. “She passed the loyalty threshold while we were in the basement. From what we were able to piece together, she had a way to use the devil’s abilities without actually being puppeted by it. She seems … powerful, I guess. Able to read me disconcertingly well, able to lie with impunity and not get caught. Not that—” I hesitated, wary of putting my foot in my mouth. “One of the things that I saw in your soul was your collection of skills. You’re good at Lying, I know you know that, you know I know that, I don’t think it’s a bad thing. I think Valencia’s better than you now, but I guess I’m not sure I’ve ever seen you stretch the art to its limits.”

“Or I did, and was so good that it passed you by,” said Amaryllis. “But you think she’s better?”

“Yes,” I replied. “I don’t know the limits of her power, the costs, the drawbacks, whatever else, but I wanted to read you in on that. Given the doubt around Grak, I didn’t think it was prudent to stop everything and tell you, because if we sent him away, he would know that something was up.”

“I don’t like it,” she said. “I don’t like being left out of the loop.”

“I know,” I replied. “There are ways that I could have done it better, more carefully, maybe we could have coordinated things before I went down there so I’d have a way to channel back without that channel being information on its own. I don’t know. I know that Valencia’s been a bit of a sticking point for you.”

“She has,” nodded Amaryllis. “I am willing to give her a chance.”

“She said that Grak was compromised,” I said. “Once she seemed fully in control of herself, she said that was the version of her story that was the truth. I’m not ready to place so much trust in her that I’m willing to remove him from the team, and even if she’s right, there might be some value in feeding false information back to Grak in an attempt to trip Fallatehr up … I don’t know, it’s a mess.”

“You had cause to believe he was compromised and sent me off with him anyway?” asked Amaryllis with a raised eyebrow. She didn’t seem angry, just curious.

“I knew you could handle yourself,” I replied with a shrug. “I knew that you would be on guard either way, that you wouldn’t let yourself slip just because it was uncertainty rather than concrete evidence. You’re the most competent person I’ve ever met.”

“Thank you,” replied Amaryllis. She looked at the soulcycle. “Should we get going?”
“Sure,” I replied. “Just like the good old days.”

She raised an eyebrow at that.

“Did you think that it was narrative?” I asked, gesturing at the soulcycle. “When Fenn showed it to you -- when I saw it, I thought it was a callback, rather than just chance, a lazy kind of nostalgia that I always liked to stick in my games. Kind of a, ‘hey, that thing from before’ type of deal.”

“You treat it all a little too flippantly sometimes,” said Amaryllis. She strode toward the soulcycle and examined it for a bit, then hopped on top of it and started it up. “Come on, let’s go.”

I climbed aboard and took the seat I’d had when we were driving through the Risen Lands, and in a way it really was like old times, driving down a stretch of road with little other traffic, just me and her.

When we got to the farmhouse, Fallatehr was waiting for us.
Amaryllis brought the soulcycle to a rest fifty feet from where Fallatehr stood, closer than I would have liked. He was basking under one of the farmhouse’s outside lights, smiling faintly at our arrival, that smile wide enough to reveal the sharp teeth in his mouth. I wasn’t frightened, per se, but I was wary. He had thrown the police my direction, and my guess was that having me cut myself off from my ability to use essentialism was a large part of the reason that he’d done that. I had to believe that removing the skill was what any soul mage would do, if faced with a sentence of death, and perhaps I would have done it even if the Abswifth and I hadn’t been able to come to such a tidy agreement. All the same, that didn’t feel like the full picture of what Fallatehr was planning.

Amaryllis stepped off the bike, gave me an uncharacteristically nervous glance, and then looked to Fallatehr as I dismounted.

“We need to have a private conversation, just the three of us,” she said to me, but voiced loud enough that Fallatehr was in no danger of not being able to hear her.

I looked at her, in her magical armor, short hair slightly unkempt from the wind of the soulcycle, then kept myself from glancing at the hilt stuck through a loop of leather at her side. I knew that it was there though. If she was compromised, then in a fight between the two of us, I was fairly sure that I was fucked, especially since my own armor was sitting in the glove on her hand. Fenn was stuck there too, for that matter, and she wasn’t about to come out without knowing what was happening outside, not when we might be cruising down the road at considerable speed. I looked at Amaryllis’ face. Compromised? It was impossible to tell just by looking at her, but I couldn’t think of any other explanation.

“Why?” I asked, voice low.

“Grak and I spoke,” Amaryllis replied, still obviously speaking loud enough for Fallatehr to hear. With how far away he was, the quiet of the farm (silent, save for the noise of insects) wasn’t enough to camouflage even casual conversation. Amaryllis was being loud on purpose though, as a signal to either me or Fallatehr, maybe both. “As I said, we have to have a talk, just the three of us.”

“You’re ambushing me,” I replied, looking her over. Ambushing me, or converted to his side and ambushing me, but I looked into your soul not less than twenty minutes ago, and I don’t understand how Fallatehr would have done it, if he did. “And you don’t want Fenn out, why?”

“She hates him,” said Amaryllis. Her voice was calm and even, like she was trying to talk down a barking dog she knew listened to tone alone. She’d used that voice on me a few times before, and I’d never liked it. “It would be detrimental to the conversation if she were interjecting.”

“Or objecting,” I replied. I glanced to Fallatehr, who was still standing beneath the light. His smile was more subdued now.

I stayed right where I was, trying to think over my options. How much did I trust Amaryllis? A fair amount. How much did I trust Amaryllis when our ally/adversary was an expert in changing people on a fundamental level? The answer to that depended on what I thought had happened between her and Grak when they were alone, unless she’d been tainted by Fallatehr’s influence even further back.

This here, what she was doing, keeping Fenn in the literal and metaphorical dark, trying to hold a
conversation with Fallatehr that I wasn’t prepared for or briefed on, that I didn’t trust.

“We’re leaving,” I said to her. “Whatever it is you want to talk about, we can talk about it somewhere else. A three-way conversation is too messy.”

“You think he has me?” asked Amaryllis, cutting to the chase. “He doesn’t. Juniper--”

“You know that anything you say is meaningless,” I replied. My hands were sweating, and I was acutely aware of the ring on my finger, the defense that I would have to deploy if things got heated. I cursed myself for not having put my armor back on when I’d had the time for it, but it wasn’t supposed to be like this, *I had cleared her*. “There’s no assurance that you could possibly make, all we have are actions and trust mechanisms, and you -- if he got to you, or didn’t, you know that this right here is a violation of my trust, and Fenn’s.”

“Arguments are still valid,” replied Amaryllis. “If he had gotten to me, altered me down to the core in some way, that wouldn’t prevent me from making a coherent argument, right?”

I paused. “It would be harder, much harder, than if I could trust you, which I now can’t. Let out Fenn. Let out Grak. Then we can talk.”

“We’ll stand apart as we talk,” said Amaryllis. “Fenn would disrupt it, you know she would. I could bring out Grak, but I think that would just make you more leery, because you don’t trust him either, and he … he was compromised, not probably, actually. He told me as much, while we were away. That’s what I want to have this conversation about.”

“Fuck,” I said, staring at her. I was more skilled with a sword than Amaryllis, but she had the better sword. All she really had to do was slip within my guard and point it at my chest, then flicker it on. That would have been true even if I had armor on. She had the glove as well, and knowing Fenn, it had a fucking ridiculous array of weaponry available at her tips if she wanted to take me out as I ran. *And she has Fenn, and the teleportation key.* I couldn’t realistically run away from this conversation, but I didn’t see what good a conversation would do, unless--

I could stall. Fenn would eventually start to wonder why she hadn’t been popped out, and despite the risk of appearing from thin air while the glove was moving over the road at sixty miles an hour, she would force her way out. Or even if she didn’t make that choice, the air tanks weren’t limitless, and she could come out rather than suffocate, the choice having been made for her. Time was on my side, as far as Fenn went … but even when she showed up, we wouldn’t actually be safe. She wouldn’t have her bow, her bow was in the glove, but it would be two against two -- two against three if Grak got out, and the two minions, who were probably just out of sight, meaning two against five.

Not that Fenn was going to come out in a good position anyway, since she would be right beside Amaryllis, disoriented and confused, and in the time that it took to get her bearings, both physically and cognitively, she could get ambushed.

*Skill increased: Analysis 3!*

“Okay, fine, let’s have this conversation,” I said, not really thinking that I had any better options. I didn’t know whether time was working for me or against me, but Fenn and Grak coming out was inevitable, and that would at least be a change. If they -- no, I couldn’t go that far, to start thinking of Fallatehr and Amaryllis as a coherent unit, not yet -- if Amaryllis didn’t seem worried about moving things along, then maybe I was the one who should worry.

*Skill increased: Analysis 4!*
I didn’t like the skill-ups. They were coming a bit too fast now, and I thought that I knew why; they came faster when I was threatened, when the skills were being put toward something vital, rather than trivial. I didn’t like the idea that this conversation was going to be vital. It would have set me on edge even if the game wasn’t implicitly saying that it was important. My heart was thumping, and I used a small amount of blood magic to slow everything down just a hair, hoping that it would keep me focused instead of hopped up on adrenaline.

“You fucked with Grak’s soul,” I said to Fallatehr. I stayed next to the soulcycle as Amaryllis moved away from me. We formed a triangle, with Fallatehr beneath the light, myself by the white glow of the souls in the soulcycle’s tank, and Amaryllis in relative darkness.

“I altered it, yes,” said Fallatehr with a nod. “There was no trust between us, and no real possibility for trust, so as soon as the opportunity presented itself to me, I acted. I wanted information, and he had it. The only other alteration I made to him was to make him loyal to me, in order to ensure that he wouldn’t reveal what I had done. It was always meant to be a short-term measure.”

“Is that supposed to make us feel better?” I asked.

“It makes me feel better,” replied Amaryllis. Her arms were folded across her breastplate. “Grak explained it to me. He came clean. Do you think that shouldn’t make us feel better? It’s truth, a truth that he didn’t need to give to us. That’s a step in the right direction.”

“No,” I replied. “It was ambiguous before, but now it’s concrete. We can’t trust him. You don’t get credit for saying sorry.” (You actually did get credit for saying sorry, and I realized that as I tried to search for an appropriately biting comparison, but I was hoping that we could steamroll past that error in my logic. ‘You don’t get credit for saying sorry’ had, for a long time, been something that I’d told myself so I could both avoid apologizing to people and hold onto grudges. Old habits, I guess.)

“All he wants is to look at your power,” replied Amaryllis.

“Which he’d need to look at my soul to get,” I replied. “And he can fuck off if he thinks that I’d ever willingly grant him access to my soul.”

“It wouldn’t be necessary,” said Fallatehr. “There are a variety of techniques that might allow me access to your soul without giving me the ability to change anything within it. That is one of the things that I would like to discuss with you.”

“I wouldn’t be able to trust those techniques,” I replied. “And furthermore, I wouldn’t be getting anything out of it, because you’re no longer my teacher.”

“We need him to be,” said Amaryllis. “You still need your bones fixed, and we still have to figure out a solution to restoring the locus.”

I stared at her. “And how the hell is he going to function as my teacher?”

“Communication over a distance is a solved problem,” Amaryllis answered. “You’ve already said that him touching you wasn’t something that was ever going to happen, and if that aspect of teaching is out the window, then there’s no point in co-location whatsoever. Given the potential downsides, which I’m ready to fully admit, there’s no reason we should be on the same continent.”

“He wants something immediate, I want something continuous,” I said, folding my arms across my chest, double-checking that the Anyblade was still there on my finger. “And to be frank, the thought of Fallatehr getting my power is too fucking terrifying to consider, so he’s not going to be studying it either way, end of story.”
“You’re upset about your friend,” Fallatehr said. He was doing the same thing she was, using a soothing voice, and it was grating on me. At least he had the excuse of not knowing better. “The effect on Grak will wear off.”

“No, I’m not upset about -- I am upset about that, but it’s not why I’m saying this,” I replied. “I’m not fucking doing whatever it is you think is the solution to the trust problem, this conversation is over unless you can furnish a hell of a better defense. Do you think that I haven’t been thinking about this? I have, and I already came to my conclusion. You’re going to have to give me new information if you want to sway me.” I looked from Fallatehr to Amaryllis. So far, the new information is that Fallatehr probably got to her too, somehow.

“Would you like to hear the methods by which I would come to understand your power?” asked Fallatehr.

I looked to Amaryllis. She hadn’t budged. I couldn’t leave the entirety of my team behind, which would be what I was doing if I ran. Soulfucked or not, she had the power to make me stay just by holding her ground. A glance at the soulcycle told me that I could probably start it up again; instead of keys in the ignition, there was the handle of a screwdriver. That probably still wasn’t an option, since I’d seen how quickly Amaryllis could cross a distance of 50 feet.

“Sure, fine,” I said. “Let’s hear it.”

“Memories are difficult to work with,” said Fallatehr. “Difficult, but not impossible. Your memories of what you have seen and felt of your own soul would suffice, for my purposes.” He held up a hand as I opened my mouth to offer the obvious objection. “I would not need to touch your soul. With your skill as it is, you would be able to transfer those memories into the soul of an intermediary, who would then go to visit me, on another continent, as Amaryllis suggested.”

“I would have to interface with the intermediary,” I replied. “No reason that you couldn’t fuck me over using them.”

Fallatehr had the gall to laugh. “Do you think it’s so easy to teach soul magic to others?” he asked. “Not everyone can pass through years of training in a matter of minutes. If they could, you wouldn’t be special enough to spend time on.”

“I’m flattered,” I replied with a roll of my eyes. Where was Fenn? As soon as she came out, things were going to change, and I needed to be ready.

“I am told that there is a limit to your soul magic beyond which you will need me,” said Fallatehr. “A numeric score presented to you?” he asked. I didn’t reply to that. To say that I needed him was putting it a bit strongly, I thought. “I will murder Rehta and Lepenn before your eyes, leaving myself with no support. The non-anima is no ally of mine, but if you wish, I will end her too. None of them were ever trained in soul magic, but if it would give you a measure of security, I would do it.” He caught something of my expression. “Or something less lethal, if you prefer? Their help to me would be marginal at best, if you were to train at a distance.”

“You really don’t have a read on me, if you think that murder is going to endear me,” I replied.

“If you’d like, I could tell you who the two of them were before I began my effort to reform them,” replied Fallatehr. “They could tell you themselves, if I had time to collect them. Perhaps that would assuage your moral concerns.”

“It doesn’t matter,” I replied. “We’re not going to do the transfer thing, it doesn’t actually help with trust if you get what you want and then leave, and I can’t imagine that you’d offer to teach me with
no chance to get what you want, not unless you were planning to betray me -- betray me again, that is, since you’ve already done it twice.”

“Twice?” asked Fallatehr with a raised eyebrow.

“Grak, and sending our information to the authorities in Parsmont,” I said.

“And did that plan of mine bear fruit?” asked Fallatehr. I could almost admire how brazen he was about it. (Almost.)

“He’s stripped of his ability to do soul magic,” replied Amaryllis.

I looked to her again, my eyes wide this time. That was final confirmation that she was compromised, well and truly, however it had happened, because I couldn’t see a single reason for her to say that, even as a ploy.

“Ah,” said Fallatehr with a smile. “Then I suppose, having offered the sugar cube, I might now try employing the riding crop. There was some danger, if you still had your capabilities, of us coming to an unfruitful war with one another on contact, one that I was not sure to escape from unscathed.” He took a step forward. “Very well then, Juniper Smith, you know that Grakhvil’s soul has been altered, and by now you must know that the same has been done to Amaryllis, or are so obstinate that it doesn’t matter whether or not you know.”

She opened her mouth to say something, and Fallatehr waved a hand to silence her. When he did, her stance changed, and she focused the entirety of her attention on me, with her bladeless hilt drawn and ready to materialize.

“Grakhvil and Amaryllis have both been instructed to end their own lives if I die, or if you are successful in your attempt to flee,” he said as he started walking toward me. “Amaryllis dear, before you kill yourself, make your best attempt at murdering the half-elf and the non-anima as well, would you.”

“Yes sir,” replied Amaryllis with a curt nod. Her mask had dropped completely, leaving only cold calculation beneath it. I just couldn’t understand how it made any sense, given what I had seen in her soul. It might have been one thing if there were some obvious change, but whatever he’d done was so subtle that I’d completely missed it.

“So, here is my offer to you, Juniper Smith,” said Fallatehr. He was walking slowly but confidently, whatever wariness he felt at the fact I was armed firmly masked. “Allow me unfettered access to your soul, and I will spare your friends, then disappear from your life forever.”

“Once you have access to my soul,” I replied, swallowing hard, “There would be no reason to keep any of your promises.”

“True,” replied Fallatehr. He kept coming closer. “But what other option do you have? Would you run away, leaving everything and everyone behind? You would be consigning them to their deaths.”

I had to admit, as I saw him coming toward me, that it did seem to be my best option. I was skeptical that he would actually kill valuable resources like that, especially if he had touched Amaryllis’ soul and seen the link going back to me (but I was skeptical of that, given that he hadn’t used it to take me over). I only had two arrows in my metaphorical quiver. The first being the fact that I still had my soul magic, something that Fallatehr seemed to think was important, and the second being Fenn, when she eventually came out of the glove.

As if on cue -- possibly literally on cue -- she appeared in front of Amaryllis. She bent over panting
and ripped off the mask to draw in air, gasping and looking around wildly. I let out an inarticulate shout of warning, but that accomplished nothing, since Amaryllis was within arm’s reach. She leaped down on top of Fenn and grabbed Fenn’s arm, twisting it behind her back and pushing hard. I didn’t know which of them was stronger, but Amaryllis was shorter, and she had to use her position to sit on the small of Fenn’s back, pinning her in place with all her weight. Amaryllis brought the sword-hilt around and pointed it at the back of Fenn’s head.

“Give him what he wants!” she shouted at me. Fallatehr had sped up, still walking with confidence, and my attention was split between him and the sight of Fenn, struggling beneath Amaryllis, trying to throw her off.

I tried to steel myself for a war of soul magic with Fallatehr, a war I would have to learn how to fight on the fly, he was still striding toward me, confident and feral, and I was struggling to remember precisely what he’d said, about not being confident that he would be unscathed, and it might have been that he was setting me up to fail, but Fenn was a single fucking thought away from having a sword straight through her head, and --

It didn’t make sense. I looked over at them again.

Amaryllis, trying to keep her position, while Fenn bucked and wriggled beneath her.

Amaryllis, being moved around while wearing the fucking immobility plate.

I waited until Fallatehr was next to me, then turned the Anyblade from a ring into a dagger, burned through four bones of my left hand at once, and with a surge of my blood working in concert, drove the dagger up toward his stomach.

Maybe somewhere in the back of my head I’d been thinking of how good it would feel to stab that motherfucker, or how fitting it would be to cut past all the bullshit and finally end him. When I went to stab him, maybe I was thinking about that, rather than what my next move would be, and that’s why, when he executed a surprisingly quick dodge, I stumbled and was put off my balance.

I’d sliced into him, a grazing cut to his side, and he clutched it while wincing in pain, then drew a dagger of his own from behind his back and clutched it in front of him. I could tell from his stance that he wasn’t incompetent, but I hadn’t had enough actual training to know whether or not he was any good just from the way he faced me.

I had an enormous number of advantages on my side. Blood magic, bone magic, the Anyblade, Ropey, a plethora of virtues, Blade-bound the most important among them -- and no small amount of righteous anger spurring me forward, the threats levied against my friends, the harms done to them. I glanced over at Amaryllis for long enough to see that she’d tossed the hilt to the side and was trying to slam Fenn’s face down into the dirt. She wasn’t using the armor or blade because she couldn’t, because she wasn’t actually Amaryllis, which explained why a view of Amaryllis’ soul had shown no hints of such utter betrayal.

Fallatehr was faster than me, and at first I thought that was his only advantage, but it soon became clear that there was something else at play, as strikes that should have hit home were turned aside with only token effort on his part, and he ducked beneath attacks that he shouldn’t have even been able to see, let alone avoid. Luck, I realized. He was hundreds of years old, and elves accumulated luck with age.

Still, he was only barely keeping up his defense. I was getting notifications for my skills as we fought, which meant that I was becoming a better fighter and mage as the battle went on. The Anyblade gave me reach, which was hard to counter against, and the extra speed and power of blood
magic, combined with the occasional surge as I pulled from my bones, meant that he wouldn’t be able to last for long. He seemed to feel the same way.

“I have Amaryllis --” our blades clanged against each other as I parried his attempt at going in low and followed it with a riposte, “-- she’s held by --” our blades met again, this time a parry from him, perfectly deflecting my attack upward, but I reshaped the Anyblade to keep his dagger from pushing me too far off the mark and he pushed himself back to avoid my quick backswing, “-- Rheta, if you - -”

The Anyblade, shaped into something more like a sickle than a sword, came slicing backward and caught him in the neck, moving through him with an edge sharp enough to cut bone. I felt a slight snag as I hit one of the vertebrae, but the resistance wasn’t much, and he stumbled back and fell over as blood began to spurt out of his throat. He clutched it, and seemed to be trying to say something, but I turned my attention to Fenn rather than try to make out what it was he was trying to threaten or coerce me with.

**Fallatehr Whiteshell defeated!**

**Quest Complete: Soul Responsibility - You have killed Fallatehr Whiteshell, whom you released from prison, before he could do much lasting damage on the world.**

(A quest that I hadn’t actually seen pop up, now marked as completed, which was something to ponder for another time.)

Fenn had things well in hand. She was sitting on top of the presumed-imposter Amaryllis, punching her repeatedly in the face. I ran over to them, with a last glance toward Fallatehr to make sure that he was staying down, and quickly drove my Anyblade, shaped to a spear, down through fake-Amaryllis’ eye.

**Lehpenn Ironwood defeated!**

“Imposter,” I said, feeling a momentary flip of my stomach as I looked down and worried that I’d made a mistake, even with what the game had told me. It looked like her, the same beauty, now spoiled by the damage that Fenn and I had inflicted. It still felt wrong somehow, when I pulled my spear from her head, like my brain wasn’t able to connect what I was seeing with what I logically knew to be true.

“We’re sure?” asked Fenn.

“Game notification,” I said, tapping the side of my head. “Not one hundred percent before that, no, but she wasn’t using her magic items, and -- maybe I knew it from instinct, or Luck, or beamed into my head by the game.” The fight against Fallatehr had left my nerves a wreck, even if it hadn’t been a pitched battle like the ones I’d fought in before.

“Fuck, I thought I was beating her half to death,” said Fenn, staring down at her bloody hands. After a moment she reached down and began working the glove off of Amaryllis' hand. “What the fuck happened?”

“Not sure,” I replied. I felt like throwing up. I looked over to the farmhouse, and when I looked back, Amaryllis' body was gone, sent inside the glove. I really didn’t know exactly what had gone on, but I could work backward. The fact that Fallatehr had made his minion Lehpenn into a pretty damn good mimic of Amaryllis seemed to indicate that he’d had access to her soul at one point or another. I wasn’t clear on the exact mechanism you’d use to make a mimic using soul magic, but copying over bones was possible, and that was probably the pathway (unless he’d done something
like what had happened to make the pelehr, but with far more skill and nuance). As for why, that was a little bit trickier. I had checked her soul to see whether anything had happened to it, and she had known that I had the means and motive to do that -- so the first thing that she would have told Fallatehr, as soon as he had made himself the most important thing in the world to her, would be that he was in danger of leaking information to me.

**Skill increased: Analysis 5!**

There were a lot of gaps in my knowledge at that moment, some of which could probably be filled through inference, but there were at least two vital issues at hand. The first, at least, I thought we could solve.

“Grak’s still in the glove,” I said. “Bring him out.”

Fenn held her hand forward and Grak appeared in front of her, looking around wildly and holding onto his tank. I leapt forward before he had a chance to get his bearings and threw Ropey at him. While the rope was wrapping itself around him, I pulled his axe from his belt and threw it aside, then pushed him to the ground. “Gag him,” I said.

Fenn pulled out a length of cloth from her glove and sat on top of him briefly in order to work it into his mouth. She punched him once on the back of his head to get him to open up and then tied the cloth tightly in place. She glanced down in the dim light and winced. “He’s bleeding, might have bit his tongue trying to keep me out.”

“Fallatehr said there was a deadman’s -- deadelf’s -- suicide switch,” I replied. “It’s probably that. I was hoping he was lying about it. Failing any other options, and with Fallatehr dead, he’s going to try to kill himself. Bring the body back out?”

Fenn stood and complied, letting the very realistic recreation of Amaryllis’ corpse fall down onto the ground. I patted it down, moving quickly, going to the places where I knew she normally kept what little equipment she went around with. I found the crystal hanging around her neck, and the cloak made of leaves that had once belonged to Solace. I put it on and reached into it, but though I could feel the extradimensional space it contained, I couldn’t feel the teleportation key there, nor the bottle.

“Teleportation key is missing,” I said.

“Well fuck,” replied Fenn. She rolled Grak over; he was staring at her with murder in his eyes. “Don’t worry, Joon’s going to fix you.”

“Teleportation key missing means that they could be anywhere,” I said. “Literally anywhere on Aerb.”

“Yeah, I said ‘well fuck’,” replied Fenn with a shrug. “What more do you want from me?”

I frowned at that and then went over to Fallatehr, who had stopped moving. I jabbed him in the head with my spear all the same. You always double-tap, that was just common sense. I searched over his body, looking to see what he had on him, but he didn’t seem to have the teleportation key either.

“Fuck,” I said. “I’m going to go grab Valencia,” I replied, before jogging off toward the house, sword drawn.

When I got to the basement though, I found it empty.

“Okay, so I think I’ve got it,” said Fenn, sometime later. Grak was tied up, and gagged as well,
though we’d tried to make him as comfortable as I could.

I’d gone back into my soul and copied over the bones, fixing the damage I’d done to myself in the course of the fight. The reusability aspect of that interaction surprised me, but I was extremely thankful for it, especially since a search of Grak’s bound (and angry) body revealed that his share of the fairies was missing.

“I should never have trusted the soul link,” I replied. “Codephrases probably wouldn’t have helped us, because if you have access to the soul to make a duplicate you can just pump them for information before reverting them, but … fuck, we could have done item identification, something like a simple demonstration that hereditary items still work, if we’d …” I paused mid-rant. “Can you demonstrate your bow for me?” I asked.

Fenn sighed. “I’ve literally been with you all day,” she replied. “You’ve seen me use the glove. You have full access to my soul. The artillery bow’s got a limited number of charges, and you’re asking me to expend one of them in order to prove something that should be completely obvious? When would I even have been replaced?”

I frowned. “Okay, point taken,” I replied. “Paranoia gone rampant, I guess.” I cracked my knuckles as I looked Fenn over. The hardest part of using soul magic to replace the bones in order to heal someone into being a physical duplicate was probably the parts where the soul didn’t actually match the body, minor nicks and scratches that hadn’t been healed yet. Clothes were easy enough to steal, and information was probably pretty easy to extract once you could fuck with values and social models, but now that I was aware of that vector of attack, I had to start thinking about ways to defend against it. (And after all, this was a setting with doppelgangers too, which we might have to face at some point in the future even though I’d been assured that Uther Penndraig had utterly destroyed the secret to their creation.)

“Alright, fine,” said Fenn, popping her bow out of the glove. Before I could object that she really didn’t have to, she fired off an arrow, which became two, then four, then eight, until a cloud of arrows was barely visible as it sailed over the farmhouse.

“You didn’t have to do that,” I said.

“And sit through you looking askance at me for the rest of our days?” she asked. “No thanks, I’d rather just spend the shot. Any bright ideas about how we find the princess and the demon girl?” She prodded me in the ribs when I didn’t respond. “Come on, normally you’re full of bright ideas, or at least ideas.”

“No,” I replied, looking down at Grak. “I have no idea.”
Amaryllis watched the car leave, tracking it until it was out of sight. She had memorized the glyph sequence as a matter of course, back when they’d purchased the farmhouse and taken stock of what was available to them, but it never hurt to get a confirmation. It was difficult to imagine a scenario in which it would be relevant, but Amaryllis had a good memory, and the cost was low.

“Come on,” she said to Grak. “We need to put some distance behind us before we leave. Not more than five minutes. I just want us to have a landing site that they don’t know about.”

“You don’t trust them?” asked Grak.

“They might become other people in our absence,” she replied.

Grak nodded at that. “And me?” he asked.

“If you’re the person I’ve known for the past few weeks,” she replied, which wasn’t actually an answer. “Then you know asking for my trust on this trip won’t endear you to me.”

“Noted,” he said with a gruff nod.

She was on guard during teleportation. It required having the key in view, physical contact with an untrusted ally, and even if used quickly, at least a few moments of being unaware of her surroundings. It was also the most valuable single item she was ever likely to possess, above and beyond any individual heirloom entad that was hers by claim-in-fact. The keys were not particularly delicate, but she couldn’t help but hold it as though it were. (No, she could help it, if she had to, it would be easy to bend her natural instinct on that score, she had just never had to, and so indulged her sense of the precious.)

Teleporting hurt, as it always did, but the pain faded quickly, and the key was stowed in the Cloak of Leaves as soon as she’d regained her senses.

Before her stood the World Spine, stretching far up above the horizon even though they were many miles away from the base. The air was cleaner and fresher than on the farmland around Parsmont, spiked with the scent of nature rather than agriculture. They weren’t too far away from where they had been just a few days prior. She had gone outside the bottle then and marked the likeliest spot by walking in a spiral, which had been easily visible from within the view provided by the teleportation key.

“We need a place with good light,” she said, looking over the clearing. “I think that this is as good as we’ll get.” The mountains ran parallel to the path of the sun, which meant that there was little need to worry about putting the bottle in the shadow of the World Spine. It was an idyllic place, though it could do with a bit of contouring. There was a beauty in the wilds of the world, but it wasn’t a perfect beauty; the chaos of stochastic process was pleasing, but could always be improved by human hands.

“Do you trust me to handle the wards?” asked Grak.

“Has it begun to grate on you?” she asked in return.

“It was a simple question,” replied Grak.

“I’ll take that as a yes,” she replied. Dwarves were, as a rule, one of the bluntest of the mortal
species, but much of this was cultural, and Grakhuil Leadbraids was some distance removed from the culture of his kind. He’d spent enough time at the athenaeum to have partially assimilated, and learned enough Anglish that he was more or less fluent. He had a relatively thick accent, and more than that, his way of speaking was still characteristically dwarven, but he wasn’t really a dwarf of the clans anymore, he was an immigrant.

He was hard to read. It was easier for a person to lie in a second language, unless that second language was granted by translation tattoos or some rarer form of magic with an equivalent function, like the tongue-rings of Ellsion or the Terridoc linkages. People who spoke a second language sometimes stopped to sort their words, just like people who were lying, and being at a remove from the actual words you were speaking was a good way to prevent yourself from having to feel the force of your lies. To add to that, much of Grak’s face was hidden by a thick beard, and his facial expression were those of a clan-dwarf, which were distinct from those employed by humans. The idiom ‘stone-faced’ had entered into Anglish right around the time of the first dwarven expansion into Anglecynn for a good reason.

Reading Grak, for Amaryllis, was like trying to read a book whose author kept using unfamiliar words and phrases, which had to be understood from context. It wasn’t impossible, merely very difficult, and over the last few days, she had been putting in far more effort than normal to figure out whether or not he was hiding something. The primary difficulty in this endeavor, aside from the difficulty of getting a good read on Grak, was that if he was acting, he was acting like himself, and in Amaryllis’ experience, that was the easiest sort of lie for a person to sell.

“Do you want me to set up wards or not?” asked Grak.

“I do,” replied Amaryllis.

The failure states were obvious. If Grak were under Fallatehr’s sway, he could set up the wards in such a way as to hold the locus hostage, which would give him leverage in future negotiations. Wards were, generally speaking, invisible, and only another wابر could check the work, which wasn’t an option here for obvious reasons. That leverage was something that Amaryllis had decided she was willing to risk even before they had arrived at this place. Not using the wards that Grak could provide meant that a random person or animal could stumble across the bottle and take it, or that it would be exposed to the elements in a way that would put it, and the land (and locus) inside it in danger. Those risks seemed to outweigh the danger of Fallatehr gaining leverage, especially since his leverage would, by necessity, not be a subtle thing. The other failure state was even simpler. If she didn’t watch Grak closely, he might try to encircle her and trap her within a ward, but she planned to watch him closely, and to make sure that his wand stayed within a few feet of the bottle. She would be happy when this was all over, and she could just regard him as a friend and ally.

“Are you going to watch me the entire time?” asked Grak as he traced out the first of his wards. The plan was that they would spend two hours here, then return to where Fenn and Juniper would be waiting.

“Do you want to talk about what’s bothering you?” asked Amaryllis.

“It wouldn’t do any good,” replied Grak. Irritation, disgust, frustration, these were all emotions that Grak was quick to express, even before.

“You seemed at ease with the decisions we made, because of how uncertain the situation was,” said Amaryllis. “I would ask what changed, but I imagine that the answer is simply time and isolation. Being cut out from a group wouldn’t agree with anyone, even if they were only a part of that group because they were paid in gold.”
Grak grunted at that, which was accompanied by a rush of air from his wide nostrils.
